**Watering During Sunshine.**—In your issue of June 12 Mr. Henry Snyder, Oxford, Md., states that "watering during sunshine causes each drop of water to act as a sun glass, bringing the rays to a focus and burning the leaves." Perhaps it would be well for Mr. Snyder to remove the blistered glass from his house and note the results. He also states that "he seldom sprays overhead unless the foliage gets dusty." I am curious to know what plants Mr. Snyder raises in a temperature varying from 40 to 80 degrees. If roses, how does he succeed in keeping the red spider off without syringing overhead? Perhaps his success in this respect is due to his keeping his house at 40 degrees? As we are obliged to keep our houses at a more even temperature than that quoted, I would be under obligations to Mr. Snyder if he would answer the foregoing questions, as we deluded people of the North feel the need of information which it seems can only be acquired from a Maryland gardener.—N. BUTTERBACH, Oceanic, N. J.

—Are plants watered during sunshine injured by it? is a query that cannot be answered precisely, either in the negative or affirmative. True it is, that, as regards many plants under glass, if water be allowed to stand in beads on the leaves and exposed to the direct rays of a noon-day sun, with the surrounding atmosphere of the house rather dry, a burned spot where every drop of water lay would be the result. Hence, condemnation of the practice of spraying all plants in bright sunshine would be confirmed by all who had been ignorant or negligent enough to admit such to occur. Begonias, Hydrangeas, Cinerarias and many more are easily spoiled by such negligence while the same plants will stand undamaged with all the spraying one wishes to administer, providing the water is not at too low a temperature, and the atmosphere is kept humid enough to allow the water on the foliage to be absorbed by the leaves, or to evaporate and mingle with the humidity of the house. Consequently, the brighter the sun and the more tender the plants the more water will be required on the paths, benches, etc. And while a drop of water remains on the foliage of such plants, no path or woodwork should be allowed to become dry. I do not believe that spraying overhead in the middle of the day should be practised, as too much time would be taken up with the operation, unless with plants that are under a well-shaded roof; but in every case a plant should be well watered at the root, when dry, and when dry only. That is, alluding to plants in active growth. Suppose you have a house, empty, with the exception of a hundred or so of Chrysanthemums in pots, placed on one of the benches, which is very often the case during summer, and the man who has charge of the same is called upon to get some plants, flowers or anything ready at the request of the lady or gentleman who may be on the eve of traveling, although he is aware that the "mums" require their morning drink, he is de-

tained until, say eleven or twelve, and finds a great many of his plants wilting. Does he feel satisfied to wait until evening to water them because Mother Nature never waters her plants while the sun shines, or will he think he has done enough in that case to water at the roots only? I think if I were in his shoes I should water top and bottom, dashing plenty of water on paths, empty benches, etc., until every plant was standing erect. It might be a mistake, but I doubt it. I am of the opinion that water of the same temperature as the house is a great benefit to the health of plants, and would prefer rain or river water to that from the well, as in the latter there are apt to be limy substances; and while it may not do any actual harm, yet one will observe where Crotons, Dracenas, etc., are continually syringed with it they gather a dirty, musty appearance, and if not sponged off pretty often they look as if not properly cared for. While practical success has been obtained in general horticulture, by the constant use of cold water and other rough and ready methods, still I believe that first-class specimens of any plants have only been produced by careful applications of the necessities to promote sturdy growth for individual plants.—DAVID McFARLANE, Wethersfield, Conn.

—I have been much interested in the letters on "Watering Plants During Sunshine" in recent issues. I think that flower seeds are more injured by watering than by any other way. I refer to flowers that are to go for seed. I have seen gardeners and nurserymen sprinkle such when it was almost, if not entirely, ripe—the idea of watering in such a way seeds that are to be stored away for future use! I have found that the best way is to let the water run under the plants, as our good brother, Alexander MacLellan, advises.—F. A. CARLSON, San Francisco, Cal.

#### English Strawberries in America.

I forward to you a few fruits of the English strawberry Royal Sovereign. Please give me your opinion of its value. The fruit, under good culture, must get an immense size, as the plants from which the specimens sent were gathered were planted on the poorest border in our garden and have received no care whatever, and were overgrown with phlox all last summer. We all think the flavor exquisite.—J. MILLER, Westbury Station, L. I.

—The fruits accompanying the foregoing communication made a very handsome appearance, conical, nearly two inches long and over one inch across at the widest part. In flavor the berry was of fair quality and vastly superior to many native varieties now largely grown, but for all that the flavor was not such as is found in Royal Sovereign in its own country. The fact that the plants received no protection whatever speaks volumes for the hardness of the variety, and it is to be recorded as an exception to the general rule that English berries do not flourish here, but, of course, further experience may modify present conclusions.—Ed.

**An Accurate Report.**—I wish to thank you for publishing my address on "Strawberry Culture" at the American Institute meeting on June 8 and to say that your report of the whole affair was very accurate and interesting.—T. J. DWYER.

**Canna Iridiflora.**—In reply to your correspondent, S. J. Yancey, who inquires after this plant, I write to say: Haage & Schmidt, Erfurt, Germany, quote Canna Iridiflora at 6 marks a dozen. Vilmorin, Andrieux & Co., 4 Quai de la Mégisserie, Paris, France, can furnish stock of the species. Probably any leading dealer in America could furnish stock or would be glad to import it to order.—F. A. WAUGH.

## For Present Sowing.

**TURNIP SEED.** We have all the best varieties.

**CUCUMBER SEED FOR PICKLES.** Our STOCKS are the Finest.

The first Consignment of our **SURE CROP, Mushroom Spawn,** just arrived.

**Quality! BETTER!! than ever!!!**

Descriptive Catalogue Free, by mail.

**WEBER & DON,** Seed Merchants and Growers,  
114 Chambers St., NEW YORK.

Mention American Gardening when you write.

## NEW CREATIONS IN FLOWERS.

If you want to know about them send 10 cts. for Mrs. Theodosia B. Shepherd's

**New Catalogue of Rare and Beautiful Flowers.**

Many New Begonias, New Cosmos, Rare Cacti, etc., not offered by others.

**Ventura-by-the-Sea, - California.**

## Orchids and Greenhouse Plants For Sale.

Address P. O. Box 645, ALBANY, N. Y.

Having disposed of several of my greenhouses and the remainder being over crowded, I have decided to offer for sale the excess, consisting of the greater portion and the choicest specimens of my collection for the past 20 years, either singly or in quantities. They are all well established, in fine condition, and many cannot be obtained in any other collection in America.

A printed list sent on application. Sales made at reasonable prices.

**E. CORNING.**

## WHOLESALE MARKETS.

### Philadelphia.

The market has been doing very well this past week. All kinds of stock continue plentiful and on most days the market is well cleared up.

Strawberries are now arriving from New York State. The first shipment reached this city from Oswego on Wednesday, 23d ult., and sold readily at 12@15c. per quart. This week the quality is better and 20c. per quart has been realized on a few crates. Several shipments have arrived from Newhaven, N. Y., which sold at 10@15c. per quart.

Harry Sproson, of Berry & Sproson, has just returned from a trip to the berry-growing districts of New York State and reports the crop the best the growers have had in many years. He also reports that the apple crop will be a small one this year.

Tomatoes—Hothouse are falling off in supply and this week will probably see the last for the season, as the outdoor stock from Jersey is now coming in. The first shipment arrived on Monday.

Raspberries—Maryland, 15@18c. per quart; Jersey, red, 6@8c. per quart; Jersey, black cap, 4@6c. per quart. Huckleberries—North Carolina, per quart, 10@12c.; Jersey, 7@9c. per quart. Blackberries—North Carolina, cultivated, 8@10c. per quart.

The supply of watermelons is much larger this week; Floridas, per 100, \$25@30; muskmelons, Florida, per basket, \$1@1.75; Charleston, Jenny Lind, \$1.50@2 per basket.

Pears—Florida, per barrel, \$2.50@3.25; selling slowly.

Asparagus—Pennsylvania, choice, per dozen, \$1.25@1.50; fair to good, 75c.@\$1.

Cabbages—Jersey, per 100, \$2.75@3.25; Norfolk, per barrel, 75c.@1.20.

Cucumbers—Norfolk, per basket, \$1@1.25; Charleston, per basket, 75c.@\$1.

Egg Plant—Florida, per crate, \$2@2.25.

Onions—New Jersey, per basket, 90c.@1.20; New Orleans, \$2.25@3; Egyptian, per bag, \$2@2.50.

Peas—Jersey, per basket, 25@40c.

String Beans—North Carolina, wax, 50@75c. per basket; green, 75c.@\$1; Jersey, wax, per basket, 90c.@\$1.25; green, per basket, \$1@1.25.

Squash—Florida, white, \$1.25@1.50 per barrel.

Potatoes are still firm, with prices unchanged.

A few shipments of sweet corn arrived from the South, but quality is poor and sales slow.

(For other reports see page 481.)

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

Patrick Hogan, a very old gardener, died recently at Bridgeport, Conn., where he had been a resident for fifty years. He was at one time gardener for Col. O. B. Hall. Mr. Hogan was a native of Ireland and was reputed to be over 100 years of age; he left property valued at \$30,000.

### Boston, Mass.

The annual rose and strawberry show of the Massachusetts Horticultural Society was held Tuesday and Wednesday, June 22 and 23. The exceedingly cold and wet spring has not been conducive to the production of the best quality of either flowers or fruits, consequently the display was not as large and possibly the quality not quite as good as in former years. The exhibits of roses made by Hon. Joseph S. Fay (M. H. Walsh, gardener) and Miss E. J. Clark, of Pomfret, Conn. (John Ash, gardener) were noteworthy. Mr. Walsh made a fine showing with his seedling roses, receiving a silver medal for Lillian Nordica and a certificate of merit for Joseph S. Fay.

Beautiful collections of orchids were shown by John L. Gardner, James Rothwell, W. P. Winsor and E. V. R. Thayer. A very handsome bougainvillea, trained in pyramidal form, exhibited by Nathaniel T. Kidder, attracted a great deal of attention. Jas. Comley showed a large collection of rhododendrons arranged with handsome colored foliage, and T. C. Thurlow an exhibit of seventy-two varieties of pæonias.

Following is the list of the prizes awarded:

Orchids—Six plants of six named varieties, in bloom, E. V. R. Thayer; second, W. P. Winsor. Three plants of three named varieties, J. L. Gardner; second, W. P. Winsor. Single specimen named, Kenneth Finlayson; second, J. L. Gardner. Tuberous Begonias—Six pots of six varieties, Edward J. Mitton.

The society's silver medal was awarded to W. A. Manda for new hybrid Lælio-Cattleya Arnoldiana var. superba.

Hardy Roses—Twenty-four distinct named varieties, three of each variety, Joseph S. Fay; second, the same; third, Mrs. E. J. Clark. Sixteen distinct named varieties, three of each variety, Kenneth Finlayson; second, Joseph S. Fay. Twelve distinct named varieties, three of each, the second prize to Joseph S. Fay. Six distinct named varieties, three of each, the second prize to same exhibitor; third, Mrs. E. J. Clark. Twenty-four distinct named varieties, one of each, the second prize to Mrs. E. J. Clark; third, Joseph S. Fay. Eighteen distinct named varieties, one of each, the second prize to Joseph E. Fay; third, Miss E. J. Clark. Twelve distinct named varieties, one of each, Kenneth Finlayson. Six distinct named varieties, one of each, W. N. Craig; second, Joseph S. Fay; third, Kenneth Finlayson. Twenty-four blooms of Mme. Gabriel Luizet, Mrs. E. J. Clark; second, Joseph S. Fay; third, Kenneth Finlayson. Six blooms of John Hopper, the second prize to Kenneth Finlayson. Six blooms of Marquise de Castellane, the second prize to Patrick Kane. Twelve blooms of any other variety, Kenneth Finlayson; second, W. N. Craig. Best single bloom of any variety introduced since 1893, Mrs. E. J. Clark. Moss Roses—Six distinct named varieties, three clusters of each, John L. Gardner; second, Joseph S. Fay. General Display—One hundred bottles of hardy roses, buds admissible, W. N. Craig; second, Kenneth Finlayson; third, Mrs. E. M. Gill; fourth, Mrs. E. J. Clark; fifth, Joseph S. Fay; sixth, William H. Spooner. Sweet Williams—Thirty spikes, not less than six distinct

varieties, The Bussey Institution; second, W. N. Craig; third, Miss M. S. Walker; fourth, Charles H. Souther. Spanish Irises—Collection, named, the second prize to The Bussey Institution.

### Port Chester.

There has been a strong desire among many of the gardeners in this locality to establish a horticultural society and recently several meetings have been held to elaborate plans. The first regular meeting was held at Irving Hall Saturday, June 26, when the following officers were duly elected: President, W. Smith, gardener to the Mallory estate, Port Chester; vice-president, W. H. Harvey, gardener to Hobert Park, Esq., Rye, N. Y.; treasurer, John Marshall, gardener to Trainor L. Park, Esq., Purchase, N. Y.; secretary, Andrew Grierson, gardener to Hicks Arnold, Esq., Rye, N. Y.

The name adopted by the new organization is the Port Chester District Horticultural Society. Its object is to promote interest in floriculture and horticulture generally in the district in which it operates, and being situated in the midst of many beautiful Westchester homes it should be a grand success. The by-laws which are now being prepared declare that all interested are eligible to membership. [This is how it should be.—Ed.] Several families of importance have declared their sympathy in a very substantial manner by contributions amounting to \$250, and more are expected. A Chrysanthemum show will be held in the Opera House in November. The Exhibition Committee has been appointed and is busy preparing schedules which will be ready in a month. American Gardening hails this young society with delight and wishes it all possible success.

## Hints for the Water Garden.

Herewith I send you some photographs showing a partial view of our Water Lily pond, with surrounding growth of bold and striking foliage plants suitable for furnishing the edges of ponds.

The pond itself is quite large, and gives us accommodation for a great many different Water lilies and other aquatic plants, all of which here flourish in the greatest profusion. The water is 4 feet 6 inches in depth at the center of the pond, and this, we think, is a great advantage over shallower depths, as once warmed the larger volume gives greater stability to the temperature of the water, and there is not the same fluctuation as in shallow ponds, when the outside temperature falls.

Of course, in having this depth it is necessary for us to grow the most of the lilies in boxes, but on the other hand we gain a little by so doing, as the water, which is heated by the sun only, passes all around the box; therefore the whole plant is subjected to a warmer temperature than if it were planted in the bottom. The hardy species, however, we prefer to plant in the bottom, and therefore the pond at the edges is only from 18 to 24 inches in depth; here we have our hardy lilies.

The feed pipe is led from a small stream that runs from a nearby spring, and we have means to close off all water from the pond, which is a great advantage, for in times of heavy rain, if we could not close off the supply, the temperature of the water in the pond would be lowered from 10 to 15 degrees. The pond is exposed to the full sun, and we endeavor to keep its temperature as much over 80 degrees as possible, although it many times falls to 70 degrees without hurt to the plants.

The large leaves seen towards the center of the picture are those of Victoria regia var. Randii, which we consider to be a great improvement over the type, as the leaves are much more handsome, the edges turning up 5 or 6 inches. The largest leaf grown here last summer measured 5 feet 9 inches

in diameter, and easily supported a boy of eight years of age, with only a thin board to distribute his weight evenly over the leaf.

The plant bearing this leaf was grown in a box 8x8x2 feet in depth, in a soil composed of turves from a pasture and cow manure six months old, half and half. This having been well incorporated by turning three times, it was then put into the box and tramped lightly. As soon as the temperature of the pond reaches 75 degrees (which is generally in the month of June) we plant the *Victoria*; after this we are careful to regulate the supply of fresh water, so that the water in the pond will not fall below 75 degrees, and generally early in August the plant begins to flower and then keeps flowering every four or five days until cold weather sets in.

For growers further north I would recommend the new form of *Victoria regia*; it is intermediate between the type and *Randii*; the leaf is green, edges turn up from 4 to 5 inches; the flower is pure white and about the size of that of the ordinary *regia*. The great point in favor of this variety is that it can be grown very successfully in a much cooler temperature than either of the others. I have grown it very well in a temperature of from 70 to 75 degrees, and have had it in a temperature of 60 degrees for several weeks together without apparent injury. Here this variety blooms towards the middle of July, and it can be had in flower before that even, if a strong plant be put out. Indeed, Mr. Tricker informs me he has flowered it in an eight-inch pot, and that is as good a recommendation as it can possibly get.

These plants may be easily raised from seed where one has a stove temperature, or even a small tank which can be stood over the heating pipes of a greenhouse. There should be no reason for failure, as next to good seed the requirement is an even, steady temperature of 85 to 90 degrees for *regia* and *Randii*, while for the new form 70 degrees will be found just right. Sow the seed in a good free loam which has been put through a fine screen, and stand the pot or pan in water, so that the seed will be covered by about two inches, and don't use any manure in the soil, for it is detrimental to young plants of all Water lilies, almost always raising a green scum or low growth, which clings to the leaves of the young plants and very often proves fatal to the seedlings. Not until the plants are ready for three-inch pots do we give them manure, and from then on they can be grown in soil similar to that used for the old plants. They are shifted as they require it, exactly as one would treat any ordinary plant. As for *Nymphæas*, seed can be procured of *N. dentata*, *N. zanzibarensis*, *N. z. rosea* and a few others, but I would strongly advise the beginner to be content with a trial of the three named. After one has been successful with them he can go into raising seedling plants extensively, but, as in everything else that is new, go slowly. Young plants of almost all the *Nymphæas* can be had at a reasonable charge, excepting, of course, a few novelties and some which are difficult to propagate.

Tropical or tender *Nymphæas* that we consider indispensable to every collection are:

*N. dentata*, flowers, pure white, and of the largest size; a very free bloomer, native of Sierra Leone. We have had flowers of this measuring 15 inches in diameter, and they are borne on good stiff stems, carried from 6 to 12 inches above the water.

*N. devoniensis* is a good companion to the foregoing; flowers of a beautiful rosy-red color, equally free in flowering. Often on large plants as many as fifteen fully expanded flowers can be counted at one time. The two are night bloomers—that is, the flowers open about darkening time, and remain open until next forenoon, when on bright days they close about 10 or 11 o'clock.

FIG. 134.—THE WATER-LILY POND IN THE GARDENS OF HON. GARDINER G. HULBARD.

but if cloudy they remain open until past noon. They open and close in this way for three days.

For day blooming tender lilies, taking into consideration freedom of growth and flower, nothing beats *N. zanzibarensis*, deep blue, with its varieties, *N. z. rosea* and *N. z. azurea*, the colors of which are described by their names. But in a batch of seedlings one often gets many beautiful shades of color. These three are easily grown and are certain to prove satisfactory; they open their flowers about 9 A. M. and remain open well on into the afternoon.

The five water lilies above named are the ones I would recommend for beginners, and after growing them for one season, then they will be sure to want some of those named below:

In night-blooming tender lilies other than the two already named, we have *N. Sturtevantii*, with flowers of a beautiful rosy red color, and of large size. It is a fine species, but needs a warm temperature to grow it to perfection, which is a great hindrance to its more general cultivation.

*N. columbiana* is the darkest of all night-blooming lilies known to the writer. The only objection to it is we don't get enough flowers from it, but what we do get are of a beautiful dark red color, and quite distinct from those of any other species.

*N. O'Marana* is of a beautiful rosy red color, and is considered by all to be one of the finest of water lilies. It is a strong grower, and the flowers are held well above the water on long, stiff stems. We have had the flowers measure 12 inches in diameter.

*N. Smithiana* shows one of the prettiest combinations of colors to be seen in the whole *Nymphaea* family; the inner petals are pure creamy white, the outer ones the same color striped with green and suffused with a beautiful rosy pink.

The night-blooming *Nymphaeas* are started from tubers that have been carried over winter in damp sand. In February or March the tubers are potted into pots or pans, and submerged in a tank where the water can be maintained at a temperature from 70 to 80 degrees. Very soon they begin to send out shoots that will emit roots at the first joint when the shoot has made a few leaves; it should then be severed from the tuber, potted into a three-inch pot, put back into the tank and grown on with shifts as required until by the month of June it will be in pots from 6 to 9 inches. By this time the pond will be ready for them. (The old tubers will send out several crops of shoots, and therefore should be retained.)

To turn once more to the tender day bloomers; besides the *zanzibarensis* varieties named above there are:

*Nymphaea gigantea*, an Australian species, and one of the most beautiful of this class; the color is a satiny blue, shading to white; stamens yellow and silk-like; flowers borne on good, stiff stems; a very free bloomer. This must be grown on without a check or the plant will form a tuber and go to rest, and sometimes it will be months before it will again start; this is the only drawback to this most charming species.

*N. gracilis*, from Mexico, is desirable; it is the only white day-flowering tropical water lily in cultivation and is very free flowering. The flower stands well out of the water on a long stem.

*N. pulcherrima* is of a bright violet color and of good size. The buds are very pretty, long-pointed and irregularly striped with chocolate red.

We turn now to the class of hardy pond-lilies, all of which are day bloomers, and the roots remain in the pond all the year round; they can be planted in the bottom of the pond or be grown in half-barrels or boxes. The hardy lilies are the easiest to grow, and there is no reason why every one should not succeed with them.

*N. alba*, the old European white lily, still deserves a place, although *N. alba*

for the seasons operations on the farm, and one which will yield the most satisfying returns is to thoroughly renovate and rejuvenate the system by the aid of that time tested and reliable remedy

- 50 Plants Golden Self-Blanching.
- 50 Plants Giant Pascal.

This offer is from a first-class, reliable grower, and will be mailed, postpaid, for one new subscription to AMERICAN GARDENING. Orders for celery plants will be filled from now until August 15th.

AMERICAN GARDENING, P. O. Box 1697, N.Y.

*candidissima* has largely supplanted it, as having much larger flower than the type.

*N. Laydekeri rosea* is a beautiful little gem of pygmaea type. The flowers on opening for the first time are of a beautiful pink, with golden center; next day the color deepens, and so on until the flower fades. We often get several shades of pink from one plant, as a good plant always carries from four to six flowers at different stages of color.

*N. Marliacæa albidia* is a desirable white and is fragrant, which quality the whites already mentioned lack; it is also one of the freest in growth and flower.

*N. Marliacæa carnea*, of a delicate flesh tint, strong growing and of a vanilla perfume. *N. M. rosea*; this is one of the very best hardy lilies; the color is a beautiful deep rose; free flowering and of strong habit. *N. Marliacæa chromatella*, a fine yellow variety with bright orange stamens; the flowers are produced in the greatest profusion; the young foliage is spotted with brown, which enhances the beauty of the plant.

We must also include our own native *N. odorata*, which is so well known for its delicious fragrance. *N. o. sulphurea* is a fine, clear yellow, the flower standing well out of the water, a form that every one should have. *N. o. exulsiata*, deep pink, is the deepest-colored hardy water-lily in common cultivation, and it is one of the most desirable; fragrant and free flowering, this is much superior to *N. odorata rosea*. *N. o. caroliniana* is without doubt the finest of the group; the plants are of the strongest growth and flower right up to frost; the color is a clear flesh pink; very fragrant; the plants for best results should not be disturbed too often.

*N. pygmaea*, the smallest species in cultivation, has flowers about the size of a half dollar, pure white, and of a decided tea fragrance. *N. p. Helvola* is a fine variety with flowers of sulphur yellow, floating on the water, and produced in great numbers; they are also larger than in the type; the leaves are green blotched with red.

*N. Mexicana* is quite hardy here at Washington, D. C., but I do not think it will prove hardy much further North; however, it will well repay a little extra care bestowed upon it in the way of protection, or, better still, removal to a cold cellar in winter. It is, indeed,

a beautiful flower; color, sulphur yellow; the flowers stand well out of the water and are of medium size. It is best to grow this in a box or tub, as it will soon run over a large area if left to itself.

*N. tuberosa rosea*, a fine pink from *N. tuberosa*, but unlike that variety, it succeeds well under cultivation; it is fragrant and quite distinct, very free flowering.

*Nelumbiums*, or lotus, all of which are hardy here, are very desirable subjects where water lilies are growing; indeed, no collection of water plants can be complete without this grand aquatic. The best known is *N. speciosum* (Egyptian lotus); the color of the flower on first opening is a beautiful shade of deep pink, with the base of petal of a soft, creamy white; this is a free bloomer and is sure to please every one. *N. album grandiflorum* is pure white, but I cannot recommend it, as it has never done well here. *N. album striatum*, petals white, striped and tipped with rosy carmine, is an odd variety, but that is about all the claim it has for the flower lover. *N. Kermesinum*, this stands next to *speciosum* for general good qualities; the color is something on the order of the *Hermosa* rose—a free flowerer and can be thoroughly recommended. *N. luteum*, the American lotus, should also be given a place; the color is a rich yellow, but we don't get many flowers from it.

For *Nelumbiums* I would advise small ponds or tanks surrounding the main pond, for then one can plant the roots in the bottom and let them run riot, which they will soon do, and take possession of every available foot of space. If this be impracticable, then they should be grown in large boxes, or they will cause no end of trouble—leaves cropping up where least expected. This will give an idea of how fast they spread: We had a shoot that escaped through a crack in one of the boxes last season run a distance of twenty feet.

The soil for all aquatics should be very rich. If one will give them as good soil as is generally given roses, the return of flowers will pay the expense of same. I always use loam and cow manure in equal parts.

Plants that we grow largely to make a setting for the pond (as one will see by referring to the picture) are mostly large-leaved tropical plants, but al-

most any plant that has beautiful foliage is admissible. *Musa ensete* is just the kind of plant wanted for this position, and it delights in the moist soil that generally surrounds a pond. *M. vittata* is well worth growing for the beautiful variegation of its foliage. *M. zebrina* is similar to the last, except the leaves are green, striped with bronze.

*Caladum esculbentum* is just at home here; *C. odorata* is another one which thrives well and is distinct from the former in that the leaves are pointed upward instead of down, as in *esculentum*. Several of the showy *Caladiums* do exceedingly well and give bright touches of color.

The stronger growing *Cannas* are also suitable for growing here, especially *Ehemanii*, *robustum* and *giganteum*, with a few of the choicer varieties of the French class.

*Solanum robustum* and *Solanum Warscewiczii* we find very useful; the later has large cut foliage and grows to a height of from ten to thirteen feet; the former grows from three to five feet and is one of the finest plants possible for this work.

*Ricinus zanzibarensis* should not be omitted where one has room for it, as it is very strong growing and its large foliage is very effective. Bamboos in variety are also quite appropriate and they grow very freely, making a beautiful feathery contrast to the heavier foliage. *Aralia papyrifera* (*Fatsia japonica*) is also a splendid plant for this work; its large palmate leaves and strong, robust growth make it a desirable plant for the banks of ponds, where it will soon show its gratitude for the unlimited supply of water it will get.

All of the *Eulalia* grasses are very fine and none more so than *E. gracillima univittata*; planted on the edge of the bank, with its long, arching leaves nearly dipping into the water, it makes a pretty picture; also, *Eranthus Ravennæ*, with its erect habit reaching to a height of from ten to twelve feet. *Arundo Donax* will reach a height of from fifteen to twenty feet in moist soil.

*Cyperus alternifolium* simply delights to be planted around the edge of the water, and a clump here and there very agreeably breaks the even line of the water's edge. *Papyrus antiquorum* (Egyptian paper plant) is quite at home used in this way, as also are

IN THE PRESS.

PRICE, \$1.00.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present growing popularity of the Water Garden is largely due, is designed to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The book will be freely illustrated with plates and illustrations in the text, and will describe all operations, from the growing of plants in tubs to construction of the large pond, planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

A. T. DELAMARE PTG. &amp; PUB. CO., Ltd.,

Box 1697, New York.

*Thalia dealbata* and *T. divaricata*, which grow nicely in shallow water and are quite interesting; their foliage is not unlike the *Cannas*.

Plants I have omitted to mention previously that grow well in shallow water, and should be used at the edges of the water are: *Lymnocharis Humboldtii* (water poppy), a yellow poppy-shaped flower with dark center, it is rarely without flower. *Limnanthemum indicum* (water snow flake); its popular name well describes this pretty flower. *Echornia crassipes* major (water hyacinth), and *E. azurea* should also be provided for.

F. BISSET, Gard. to Hon. Gardiner G. Hubbard, West Washington, D. C.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Window Box Needs.

A good body of upright plants for the main or central filling, a clothing drapery for the sides and a harmonious selection of colors are three strong general needs of the window box. This the florist usually understands quite fully, but the home gardener too often neglects to note the imperative points for insuring a successful and satisfactory result. Two colors, in addition to the greenery, are better than more; and if one of these is white all the better. Rose and purple pinks should by all means be kept away from yellowish pinks and reds, as well as from yellows. Let the novice beware of using *Maurandias* and *Nasturtiums* together, for instance. *Nasturtiums* with white are, however, most excellent. The double yellow trailer is very good.

#### Summer Investments in Orchids.

If one have any outside privileges as regards access to the ground, perhaps there is no better time than the present to acquire orchid plants. At all times of the year the transition from the moist warmth of the glass house to the dry heat of the dwelling is one of more or less shock to the plant. But, during June the outside temperature is quite likely to average moderate, while the pots may receive cool moisture from the damp soil, if set as near it as may be. Frequent gentle showering when there is not rain, with care not to allow a superabundance of water at any one time, will do much to tide the plants over the change with a minimum of injury. Shade, more or less dense, is grateful to most sorts.

#### A Disappointing Class of Plant.

Many of the newer plants similar in general traits to the Morning Glories have proved a snare and a disappointment to the amateur or novice buyer. Some of them have hard-shelled seeds, which have failed wholly or largely of germination. Some have been poor growers, or have required too long a season for northern latitudes. Filling or soaking the seeds will help to obviate the first difficulty. Growing inside until there is ample heat without will overcome the second. The *Minas* are among the troublesome ones to many. But a later one, *M. sanguinea*, is classed as more tractable than *M. lobata*. As a family, these plants are amenable to window culture and lend themselves to the needs of the window box, where their growth of drapery is not too ample.

#### Have We a Perfectly White Geranium?

Though it is a far cry from the first notifications of the trade concerning a novelty to the offering of such novelty at retail, the public cannot fail to be interested in the advance stories regarding a new and faultless white geranium, "a variety," says the introducer, "that will probably never be equalled." Look at the list of good qualities: 1. Flowers perfectly round; 2. truss compact and strong of stalk; 3. color, pure waxen white; 4. absolute resistance of sunburn and scald;

5. dense foliage; 6. unapproached freedom of bloom; 7. petals wholly persistent and non-falling until a fine ball of bloom is formed; 8. unrivalled ease of propagation; 9. best of shipping qualities of blossoms. All this is claimed for the new candidate, "La Purite," and it is indorsed by the city park gardener of Reading, Pa. (whence it is to be distributed), as a superb flower and plant. As no white geranium has ever yet been exactly all that was to be desired, interest in this novelty will be wide-reaching. It is to be put out by a woman florist, whose circular, while strong in its wording, is most business-like and dignified. One misses, with a sense of extreme satisfaction, the humiliating "please-patronize-me-because-I'm-a-woman" cry, lately becoming so common.

#### A Beauteous Novelty.

Last year a few firms offered, in the list of rose novelties, a new hybrid perpetual named "Clio." One dealer alluded to it as without question the finest white hybrid to date. As its "date" was more recent than that of "Margaret Dickson," its claim of superiority affected even that beautiful sort. Blooming with us this season, Clio is superb in beauty of flower. It is barely white—flesh-white is the nearest term perhaps. The form is something like that of *La France*, but better, its beauty being such that one would swear it to be a tea rose. The single bush we have has not proven a good grower, but this may be an individual demerit only.

#### Can "Suburbanite" Raise Poultry.

Suburbanite has several building lots which, while waiting for a rise in values, are yielding no returns. He inquires whether he could profitably build fowl houses and rear poultry upon them. Why not? So far as the fowls are concerned there is no reason to the contrary; but Suburbanite is seldom at home and must relegate the care of his fowls to hired servitors. All depends, then, upon the help engaged. If the man in charge understands poultry, or even if he is intelligent, and, above all, "a good hand at chores," he will make the venture a success. The quoted expression is the farmer's way of describing the faculty of "giving attention to details," which the poultry press so often exploits. The inquirer is anxious, as is so often the case, to grasp the whole business at once by putting up a number of buildings and buying fowls to stock them. He has been advised rather to buy (as it is now late to hatch) chicks four weeks old, enough to stock but one or two small houses for the coming winter. He has the rare chance thus to buy, and the advice, strictly followed,

#### Beware of Ointments for Catarrh that Contain Mercury.

as mercury will surely destroy the sense of smell and completely derange the whole system when entering it through the mucous surfaces. Such articles should never be used except on prescriptions from reputable physicians, as the damage they will do is ten fold to the good you can possibly derive from them. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, O. contains no mercury, and is taken internally, acting directly upon the blood and mucous surfaces of the system. In buying Hall's Catarrh Cure be sure you get the genuine. It is taken internally and is made in Toledo, Ohio, by F. J. Cheney & Co. Testimonials free.

Sold by Druggists, price 75c. per bottle.

## METAL WHEELS

in all sizes and varieties, to fit any axle. They last forever. Either direct or stagger spoke. Can't break down; can't dry out; no resetting of tires. Good in dry weather as in wet weather. Send for catalog & prices. ELECTRIC WHEEL CO., QUINCY - ILLINOIS.

## Poor Pilgric,

there is no need for you to contemplate a wig when you can enjoy the pleasure of sitting again under your own "thatch." You can begin to get your hair back as soon as you begin to use

## Ayer's Hair Vigor.

may either save him much money if he falls or be the foundation of his future success. It is good advice in either case.

#### East Windows.

Whatever may be the desired facing point of the winter window, experience goes to prove that, for summer, the east window is most nearly ideal for the general run of plants; the northeast aspect is fine, but seldom available. The morning sun, without the mid-day heat, is now greatly to be desired. All the air available without too strong draughts is not only a great advantage to the plants now, but of inestimable help in giving them a good constitution wherewith to resist the less favorable winter conditions. But heavy winds are injurious to foliage directly, and also indirectly through the drying effects at the root.

MYRA V. NORVS.

#### Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticultural Landscape Gardener. Plans and estimates furnished. Mention *American Gardening* when you write.

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 188, New York City.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance. The address will be charged as part of the advt., and each initial, or a number, counts as one word. No cuts or display type allowed.

HULSEBOSCH BROS., bulbs and plants, Englewood, N. J.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York

VEGETABLE PLANTS: Celery, 1000, \$1.25; Cabbage and Tomato, 1000, \$1.00; Peppers, 1000, \$2.00. Price list free. E. C. Hargadine, Felton, Del.

#### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

SITUATION as gardener's assistant, Scotch American, age 21. William Hosack, 208 Warren St., Brooklyn, N. Y.

## WANTED

A copy of Sayer's book on the Dahlia (Boston 1889). Address,

Editor AMERICAN GARDENING, P. O. Box 4867, New York.

## WHOLESALE MARKETS.

### New York.

The cut flower market has reached a complete state of summer dullness and business is practically at a standstill.

Fruits and vegetables are moving freely, and considering the quantity coming in prices may be considered fair.

Hothouse grapes are slightly ahead of the demand except for exceptional quality.

Hothouse tomatoes have been clearing out well at 10¢12c. per pound.

Mushrooms, when sound and in good color, are making 50¢60c. per pound, with a few extra special, 75c.

Hothouse cucumbers are only worth \$2 per 100.

The strawberry crop is nearly over. Oswego County, N. Y., has the field almost to itself.

Monday's steamer from the South brought 5,000 barrels of Le Conte pears; the price came down to \$2.

Red currants and gooseberries are having a hard time and are making poor prices. If the former make 4c. per pound they do well. Preservers are only paying 3c. Gooseberries are only averaging 4c. per quart.

Cherries, if prime, are selling well; California-grown are remarkably fine just now.

Apples.—North Carolina, green, per barrel, \$1¢1.50; North Carolina, green, per one-half-barrel basket, 40¢60c.

Strawberries—Western New York, extra, per quart, 10¢12c. common to good, quart, 6¢8c.; Staten Island, per quart, 6¢12c.; up-river, upper stations, usual sorts, 8¢10c.; lower stations, usual sorts, 4¢7c.

Raspberries—Up-river, red, per pint, 6¢7c.; per three-to-quart cup, 4¢5c.; four-to-quart cup, 3¢4c.; Jersey, red, per pint, 6¢6c.; Maryland, red, per pint, 4¢5c.; black-cap, up-river, fancy, per pint, 6¢6c.; Jersey, per pint, 4¢5c.; Maryland, per pint, 3¢4c.; Maryland, per quart, 5¢7c.

Gooseberries—Large, per quart, 5¢6c.; small to medium, green, per quart, 3¢4c.

Huckleberries—North Carolina, large, blue, per quart, 8¢10c.; poor to fair, per quart, 6¢7c.; Maryland, crackers, per quart, 6¢7c.; Jersey, per quart, 8¢10c.

Blackberries—Maryland, Lucretia, per quart, 12¢13c.; other cultivated, per quart, 10¢12c.; Early Harvest, per quart, 7¢8c.; wild, per quart, 4¢5c.; North Carolina, cultivated, per quart, 7¢10c.; small, per quart, 5¢6c.

Currants—Large, red, per quart, 3¢4¢5c.; inferior, per quart, 2¢3c.; bulk stock, per pound, 2¢4c.

Cherries—Sweet, per pound, 4¢8c.; sour, per pound, 4¢6c.; eight-pound baskets, as to size and condition, 20¢50c.

Melons—Watermelons, Florida, good to choice, per car, \$12¢15¢; Florida, per 100, \$12¢30; muskmelons, fancy, per bushel basket, \$2; poor to fair, per basket, 75c. 4¢1.50.

Peaches—Georgia, Tillotson, per carrier, \$1.50¢1.75; Georgia, early sorts, per carrier, \$1.00¢1.25; North Carolina, early sorts, per carrier, \$1.00¢1.25.

Plums—Botan, poor to good, per carrier, \$1.00¢1.25; Wild Goose, per carrier, \$1.00¢1.75; Chickasaw and Robinson, per carrier, \$1.00¢1.50.

Grapes—Florida, Niagara, poor to fair, 25 to 30-pound cases, 50¢¢1.25.

Cauliflowers, per barrel, \$1¢1.50.

Cabbages—Jersey and Long Island, per 100, \$2¢2.50.

Cucumbers—Norfolk, per barrel, \$2.25¢2.75; Norfolk, per basket, 75¢90c.; North Carolina, per crate, 50¢75c.; Charleston, per basket, 40¢75c.; Savannah, per basket, 40¢65c.

Egg Plants—Florida, per one-half-barrel box, \$1.50¢1.75; Florida, per basket, \$1.25¢1.50.

Onions—Maryland, per one-half barrel basket, 85¢¢1; Eastern Shore, per one-half-barrel basket, 75¢85c.; North Carolina and Virginia, per barrel, \$2; Kentucky, per barrel, \$2¢2.25; New Orleans, per barrel, \$2¢2.50.

Peas—Long Island, per bag, 40¢50c.

Peppers—South Jersey, per crate, \$1.50¢1.75.

String Beans—Jersey and Maryland, wax, per basket, 50¢55c.; Norfolk, green, one-half-barrel basket, 40¢60c.; Norfolk, wax, one-half-barrel basket, 40¢50c.

Tomatoes—South Jersey, per crate, \$1.50¢1.75; Mississippi, per flat case, \$1; Savannah, per carrier, \$1.25¢1.50; Florida, prime, per carrier, \$1.00¢1.25; Florida, poor to good, per carrier, 75¢¢1.

### Boston.

There is a large movement in all kinds of fruits and vegetables. Everybody

seems to be making a little money. We do not think profits are large, but dealers seem to buy about what they are to be able to sell at an advantage.

Strawberries from Connecticut finished on Tuesday. Dighton berries will run the week; Western New York nearly in its height; near-by about half through. Some of the fine Marshalls or choice Belmonts bringing 25¢30c.; Bubachs, 20c.; Dightons, 5¢6c.; Western New York, 5¢12c., according to quality.

Hudson River currants, 6¢10c. a quart; York State cherries, 30¢50c. a ten-pound basket; some fancy near-by cherries brought in last Monday sold at 13¢20c. a quart; those bringing the latter price were "fine as silk."

Hudson River red raspberries, 5¢7c. for thirds. North Carolina blackberries, 11¢15c.; little better demand and lighter supply.

South Carolina peaches all the way from \$2¢3 per carrier.

Virginia finished on cabbage, Long Island and opening up in good shape; stock brings, 1¢¢1.25.

Quite a few Russets linger at New England points; sell at \$4; while green stock from Virginia has a range of \$1¢1.50 per basket.

Botan plums selling all the way from 25¢40c. a basket; Le Conte pears, \$2.50¢3.50 per barrel; neither of these two articles are called for, yet, when arriving on the market bring their full value, according to their quality.

Choice watermelons, 25¢30c. apiece. Southern cucumbers are so poor that demand for hothouse stock is very good; 2¢4¢3c. each.

Kalamazoo celery appears and is a little high for a good many, but those that take it pay 50c. a bunch.

Some home-grown summer squash showed up Monday morning and sold at \$1 a dozen; Southern marrow broke down to \$1.50 a barrel.

Long Island beans came to light on the same day; \$1.50 per bag.

Louisville onions find a ready sale at \$2.50 per barrel; about the same price as Egyptians; while Virginia stock is easier; \$1¢1.25; new onions, 4c. per bunch.

Tennessee sweets dropped 25c. a bushel and can be had at \$1¢1.25.

Some early home-grown peas selling 40¢50c. a bushel, while McLean's brought 50¢55c., and the dealers were glad to let them go even at those figures.

Virginia wax beans are in lighter supply and varied in quality, the best bringing 75c. per basket.

Under-glass tomatoes a peg higher; 12¢15c. a pound. A car of Mississippi four-basket crates placed at \$1 per crate early in the week, while Florida stock sells \$1.25¢1.50 per six-basket carrier.

Asparagus nearly over now and brings about 50c. a dozen.

Gooseberries unchanged; 4¢8c. per quart; huckleberries, 10¢14c. per quart; mushrooms, 75c. per pound.

Native beets, 2¢4¢3c. a bunch; egg plant, \$1¢1.50 a bushel; old carrots hold their own at \$1.25 a bushel; radishes, 15¢25c. per dozen bunches; new carrots, 4¢8c. per bunch; turnips, 6c. per bunch; limited demand for spinach; 30c. a bushel; parsley continues at \$1.25 per bushel.

Hebron potatoes, 60c. a bushel; York State varieties, 35¢45c.; little firmer feeling in old stock; new Virginia potatoes take a range \$2.50¢3 a barrel; while some inferior have to be sold \$2¢2.25.

(See also page 476.)

## A PIONEER SHOEMAKER.

### WORKING AT HIS TRADE ALTHOUGH EIGHTY-FIVE YEARS OLD.

Mr. James McMillen, of Champaign, Has Followed the Shoemaker's Trade All His Life—Every Day at His Bench Working with Apparently the Same Vigor as a Young Man—A Sketch of His Life.

From the Gazette, Champaign, Ill.

At the advanced age of eighty-five years, James McMillen, of 112 West Washington street, is one of the most active men in Champaign, Illinois. Mr. McMillen is a pioneer citizen of the city, and his form is as familiar on the streets as that of any citizen of the town. All his life Mr. McMillen has followed the trade of shoemaker, and every day finds him at his bench, bending over his work with apparently the same vigor he commanded when he was a young man.

He has a little shop on North Wright street, in the vicinity of the University of Illinois, and he is the official shoemaker, as it were, for the students of that institution.

About a year ago Mr. McMillen was absent from his bench for several weeks, and his familiar form was missed along the streets. The local newspapers announced that he was dangerously ill. For months he was a sufferer, but finally he appeared again at his shop, and has lost but very few days since then and none, perhaps, on account of sickness. His friends were surprised to see him out again, and they were more surprised when he told them the cause of his recovery.

There was no small amount of local interest in his case, and a reporter visited him, to have him relate the story.

"I feel," said the spry old gentleman, "that I owe my life to Dr. Williams' Pink Pills for Pale People. Something like a year ago it appeared to me that I was almost a physical wreck. I was suffering from a disease of the kidneys. A thick scurf had formed on the bottoms of my feet and my ankles were terribly swollen and inflamed. In fact, they reached such a condition that I could not walk, and it looked as though my days were numbered.

"I read in the newspaper testimonials from people who claimed to have been cured of kidney trouble by the use of Dr. Williams' Pink Pills for Pale People, and thought that it would do me no harm to give them a trial. I bought a box of them at the drug store and began taking them according to directions. It may seem strange, but it is a fact that I felt the benefit of them almost as soon as I began to take them. After I had taken a few pills my urinal discharges became a most as black as tar and I noticed at the same time that the pain and soreness were leaving my kidneys.

"A few days later the swelling began to go out of my ankles, and at the end of five weeks it had entirely disappeared, taking with it that terrible scurf which had formed on the bottoms of my feet and caused me so much trouble. I continued to gather my lost strength, and at the end of six weeks I felt entirely recovered and resumed my work at the shop. I think I took from four to five boxes of the pills and have taken none since."

Mr. McMillen's residence on West Washington street, is more than a mile distant from his shop, but nearly every day he walks the entire distance, morning and evening, and he could not do this if that swelling still existed.

Mr. McMillen has no backwardness in talking of the merits of Dr. Williams' Pink Pills.

Dr. Williams' Pink Pills for Pale People contain all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are sold in boxes (never in loose form, by the dozen or hundred) at 50 cents a box, or six boxes for \$2.50, and may be had of all druggists or directly by mail from Dr. Williams' Medicine Co., Schenectady, N. Y.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is a reflection and an index of our subscribers' interest in us.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call for the desired assistance. Understanding thoroughly the value of the paper to every one interested in Gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER PREMIUMS

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us **AT LEAST** one new subscriber before the close of Summer.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only seven new subscriptions at \$1.00 each.

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. Handsomely illustrated, cloth, 12mo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only "Mum" book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases,

dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo. cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Grape Growers' Manual.** (The Bushberg). An exhaustive work on the cultivation of the grape, with accounts of diseases, insects, etc., by specialists. The descriptive list of varieties is specially useful and complete; the typographical method of designating importance of varieties is a feature. Pp., 200. Royal 8vo. Illustrated. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Greenhouse Construction.** By PROF. L. R. TAYLOR. A complete treatise on Greenhouse structures and arrangements of the various forms and styles of Plant Houses for professional florists as well as amateurs. All the best and most approved structures are so fully and clearly described that anyone who desires to build a greenhouse will have no difficulty in determining the kind best suited to his purpose. The modern and most successful methods of heating and ventilating are fully treated upon. Special chapters are devoted to houses used for the growing of one kind of plants exclusively. The construction of hotbeds and frames receive appropriate attention. Over one hundred excellent illustrations, specially engraved for this work, make every point clear to the reader and add considerably to the artistic appearance of the book. Cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**How to Grow Cut Flowers.** By M. A. HUNT. A thoroughly practical treatise on the cultivation of the Rose and other flowering plants for cut flowers. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**How to Know the Wild Flowers.** By MRS. WILLIAM STARR DANA. A guide to the names, haunts, and habits of our common wild flowers. The most handy and easy reference book for amateurs. With 100 illustrations by Marion Satterlee. 12mo. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Henderson's Handbook of Plants and General Horticulture.** By PETER HENDERSON. This has long been acknowledged as the standard American work on general horticulture, giving history, geographical distribution and cultural directions for all cultivated fruits and flowers. Illustrated. Cloth, 8vo. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Insects Injurious to Fruit.** By PROF. WM. SAUNDERS. A work of great value to all fruit growers, written by a man of science as well as a practical agriculturist, and the result of careful and minute observations and experience. It treats, under separate chapters, of the injurious insects which prey upon our fruit trees, vines and bushes, together with their mode of operation, and contains careful directions as to the best means of destroying them. With over 400 pages, 440 illustrations. 12 mo. Cloth. \$2.00.

*Given for 5 new subscriptions at \$2.00 each.*

**Johnson's Gardener's Dictionary.** This is a new and revised edition, greatly enlarged, of "Johnson's Cottage Gardener's Dictionary," first published in 1846; containing a full and reliable list of every plant in cultivation, names printed in bold type, rendering reference easy. An important feature of the work is the placing of synonyms alongside the correct name, instead of in a separate list. The habitat of each variety is given along with the date of its introduction. The cultural directions are brief and to the point. Insect foes, diseases and their remedies are fully described, and figures of some of the former have been given. Handsomely bound in one volume. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Landscape Gardening or How to Lay out a Garden.** By EDWARD KEMP. Intended as a guide in choosing, forming or improving an estate (from a quarter of an acre to a hundred acres in extent), with reference to both design and execution, with numerous fine wood engravings. Cloth, 12mo. \$2.50.

*Given for 6 new subscriptions at \$1.00 each.*

**Parsons on the Rose.** By SAMUEL B. PARSONS. New and revised. A treatise on the propagation, culture, and history of the Rose. Illustrated. \$1.00.

*Given for 3 new subscriptions at \$1.00 each.*

**Practical Floriculture.** By PETER HENDERSON. A guide to the successful propagation and cultivation of Florists' Plants. As in every work from this gifted author's pen nothing has been left unsaid that bears on the subject. Illustrated. Cloth, 12mo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Profits in Poultry.** Useful and ornamental breeds and their profitable management. This excellent work contains the combined experience of a number of practical men in all departments of poultry raising. It is profusely illustrated and forms a unique and important addition to our poultry literature. Cloth, 12mo. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Strawberry Culturist.** By A. S. FULLER. Containing the history, sexuality, field and garden culture of strawberries, forcing or pot culture, etc., fully illustrated. Flexible cloth, 12mo. 25 cts.

*Given for 1 new subscription at \$1.00 each.*

**Success in Market Gardening.** By W. W. RAWSON. Illustrated. This work is written by one of the most successful market gardeners in New England, who gives here the results of his life-long experience in the growing of vegetables out-of-doors and under glass, with special adaptation to the climate of New England. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Shrubs of Northeastern America.** By CHAS. S. NEWHALL, author of "The Trees of Northeastern America," etc. This volume is beautifully printed on beautiful paper, and has a list of 116 illustrations calculated to explain the text. It has a mine of precious information, such as is seldom gathered within the covers of such a volume. Illustrated, 8vo. \$2.50.

*Given for 5 new subscriptions at \$1.00 each.*

**The Rose.** By H. B. ELLWANGER. Revised edition. A treatise on the cultivation, history, family characteristics, etc., of the various groups of roses, with names and accurate descriptions of the varieties now generally grown, brought down to 1892. This work contains full directions for planting, pruning, propagating, and treating of diseases, and insect pests, and is particularly valuable for its classification and full alphabetical lists of one thousand and eighty-six varieties. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**The Treasury of Botany.** Edited by LINDLEY and MOORE. This is a popular Dictionary of the Vegetable Kingdom, with which is incorporated a glossary of botanical terms. Twenty steel plates and numerous wood cuts. Two parts, Fcp-8vo., 1372 pp. \$3.50.

*Given for 10 new subscriptions at \$1.00 each.*

**The Small Fruit Culturist and Nursery Directory.** By A. S. FULLER. This is the first work devoted exclusively to small fruits, and completely covers the ground of propagating, culture, varieties, preparing for market, etc. Thoroughly illustrated, cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**The Art of Propagation.** By J. JENKINS. A concise, practical treatise on the rapid multiplication of vines, plants, trees, etc., detailing the management in propagation of seeds, bulbs, cuttings, etc., and the manner of operating in grafting, budding, inarching, etc. Amply illustrated. 30 cents.

*Given for 1 new subscription at \$1.00 each.*

**Tomato Culture.** By J. W. DAY, D. CUMMINGS, and A. I. ROOT. In three parts. A valuable treatise, embracing field culture, forcing under glass, and raising plants for market. Of value to any one growing garden truck of any kind aside from tomatoes. 150 pages. Illustrated. Paper. 40 cents.

*Given for 1 new subscription at \$1.00 each.*

**The Nursery Book.** By PROF. L. H. BAILEY. This is a complete handbook of propagation of plants treating on seedage, separation and division, layerage, cuttage, graftage, including grafting, budding, inarching, etc. It tells plainly and briefly what everyone who sows a seed, makes a cutting, sets a graft, or wants to know. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Amateur Orchid Cultivators' Guide Book.** By H. A. BURBERRY, F. R. H. S., orchid grower to the Right Hon. Jos. Chamberlain, M. P. Tells how to grow Orchids, in cool, intermediate, or warm houses, successfully. There is a calendar of operations for each month, and full information as to the treatment required by all orchids mentioned in the book. Just published. New edition, colored plates. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Trees of the Northern United States.** (Their Study, Description and Determination). By PROF. AUSTIN C. APGAR. This handbook is to the trees of its locality what Gray's well-known Manual of Botany is to the other plants. It furnishes a complete key to the wild and cultivated trees found east of the Rocky Mountains and north of the southern boundary of Virginia and Missouri. Preceding the key are chapters discussing the essential organs of trees and terms needed for their description, and the plans and models for tree description. The book is profusely illustrated, handsomely bound, and will be sent to any address on receipt of price. Nearly 500 illustrations, cloth, 12mo. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**The Dictionary of Gardening.** A Practical Encyclopedia of Horticulture. By GEORGE NICHOLSON, A. L. S., assisted by some of the most eminent writers in the botanical and horticultural world. The Dictionary of Gardening is the most complete work of the kind ever published; the practical information and botanical classification have been brought down to the latest date, and nothing has been neglected to make it in all respects the standard work on horticulture in all its branches, from the growing of the hardiest plants to the cultivation of the most delicate exotics. It is the recognized authority of the Society of American Florists on nomenclature of plants. Illustrated, with more than 2370 first-class engravings with numerous colored plates of exquisite finish and life-like exactness. 4 vols., cloth, large, 8vo. Prepaid, per volume, \$5.00; complete, \$20.00.

*Given for 40 new subscriptions at \$1.00 each.*

**Vegetables, How to Grow them.** By E. WATTS. 40 cents.

*Given for 1 new subscription at \$1.00 each.*

**Vines and Vine Culture.** (Considered the best book on Grapes). By ARCHIBALD F. BARRON, ex-superintendent of Royal Horticultural Society's Garden, Chiswick; Secretary of the Fruit Committee. Demy 8vo., handsomely bound in cloth. 3d edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Wild Flowers in Art and Nature.** By J. C. L. SPARKES, Principal of the National Art Training School, South Kensington, and F. W. BURBIDGE, Curator of the University Botanical Gardens, Dublin. With 21 full-page colored plates, by H. G. Moon. Handsomely bound, gilt edges. \$4.

*Given for 7 new subscriptions at \$1.00 each.*

## A YARD OF ROSES.

Copyright, 1896, by O. D. Gray, New York.

The illustration but faintly represents the beauty of this celebrated painting by the well-known artist, Mr. Newton A. Wells. The grouping and coloring has been performed with exquisite taste, and the reproduction we offer is worthy a frame, and a position on the wall of any one's room. This sketch, in eleven colors, is 36 inches long and ten inches wide, on heavy drawing paper, and sells in the art stores of New York for fifty cents. We will send "A Yard of Roses," securely packed in a tube to prevent injury, postpaid, as follows:

To all renewing their subscription and adding five cents to pay postage and packing.

To all sending us \$1.00 for their own renewal subscription and 75 cents for the subscription of a friend, we will send "A Yard of Roses" free and postpaid, as a premium to both addresses.

## The Old Strawberry Bed.

The old Strawberry bed must now receive prompt attention whether it is to be carried over for another fruiting, or not. Any care bestowed now will result in freedom from insect and disease troubles in the future.

The whole country seems to be badly infested with leaf rollers and all sorts of fungi, and for them all the old bed is the finest breeding place in existence; and the rapid increase of the pests is largely due to negligence of such. The idea that these insects have their natural enemies and that therefore we not need concern ourselves must not be entertained, but if the old patch is not to be fruited again it should be plowed under at once. I believe it is far safer to burn it over before plowing, but if this cannot be done, a chain should be attached to the plow, so that not a leaf will be left above ground on which an insect could feed.

If these old beds could be sowed to cow peas, or some leguminous plant, so the ground could be enriched and manure applied during the fall and winter, and then reset next spring, great results would follow. A rotation is much better if it can be had

We practice setting Raspberries or Blackberries after Strawberries, taking care to enrich the ground as described.

Leguminous plants, with liberal applications of potash in the form of wood ashes, or the potash salts and phosphoric

acid as found in bone meal make the cheapest fertilizer. Great results cannot be obtained without plenty of humus in the soil and cow peas furnish this with great certainty. If the fall is sufficiently supplied with rain they will make a great growth if sowed right after the berries are picked.

If the bed is to be fruited again, then as soon as the last berry is picked, mow off the foliage; not too closely however, as it is better and safer to leave stems quite long to protect the crowns. Stir up the mulch so it will get dry and when all is ready and the wind blowing quite hard, apply the torch and burn all black as ink. Then not a leaf eating insect or vestage of fungus is left to tell the tale. If a mulch has not been

FIG. 135.—VIGOROUS YOUNG GROWTH OF PAULOWNIA IMPERIALIS. (See page 490.)

used, apply directly on the row enough straw to secure a good burn. If the wind is blowing quite hard the fire will pass over rapidly and one need have no fears about injuring the plants; plants are only heated when the fire passes slowly.

I have practised this method for many years and have never injured a plant.

Sometimes there are trees, bushes or buildings on the windward side; in that case back-fire, by setting the edges on fire and burning a strip off, then go to the windward side and let the flame go with a rush.

Immediately the fire is out lose no time in cultivating. The pickers have been tramping the ground for weeks and it is in consequence as hard as a rock. Capillary action is perfect and the moisture will pass to the surface, to be carried off by the wind with the greatest celerity, and the ground quickly becomes dry below the roots and the plants perish. More plants are killed by this neglect than by the fire. What plants are killed by fire are too weak anyway and should be destroyed; but the best ones often perish by this neglect of cultivation, and the owner charges all to the heat.

Narrow the row as close as you can by leaving only one plant every ten or fifteen inches. If you have any good rotted manure or other fertilizer, sow it broadcast before starting the cultivator. The new bright green foliage will soon appear, and in two or three weeks runners will start. Cultivate the same way every time and throw the runners around, and when one plant has formed cut the runner off just beyond, and it will soon develop new crowns and be a large plant before the ground is frozen up. This runner cutting is done in a wholesale way by attaching a rolling cutter to the side of the cultivator. It is made adjustable so it will follow and adapt itself to uneven places. A guard raises the leaves so they are not injured. The work can be done rapidly with a sharp hoe. The natural tendency of runners is to go straight out, so as to establish the new plant in open sunlight; they are thus admirably exposed to wheel or hoe for removing.

In no case must one plant be allowed to stand close to another so its foliage will fall over the crown of another plant, as strong fruit buds will not form in deep shade. Give each plant plenty of sunlight, and keep the cultivator going until freezing sets in. It is a blunder to stop the cultivator.

As to whether it will pay to fruit two or three years depends on conditions. If the bed be seeded with grass and sorrel or other weeds not killed by the fire, it will not pay; neither will it pay if a very large and exhaustive crop has been raised; in such a case better plow under at once.

No one can afford to offer the market poor fruit. It is better to have large, fine, rich, firm berries, and these can only be secured from vigorous plants.—R. M. KELLOGG, Three Rivers, Mich.

#### Clematis Dying Off.

I set out three Clematis (two Jackmanni and one Henry) last spring, following closely the florists' instructions, digging the hole 18 inches deep and 12 inches in diameter, and setting the crown of the roots about four inches below the surface. The plants grew splendidly for about two months and began flowering, when one by one the leaves commenced to droop, dry up and blacken upon the stems. I looked for cut-worms, but could not find any. Soil: Loam hauled from the pasture and filled in about two feet on a clay sub-soil. Drainage good. I wish to plant three more next spring and would be grateful for any additional advice on preparation of soil, etc?—H. J. BOTHE.

From your description of the work the planting was properly done and we are at a loss to know what the trouble can be unless, as does happen occasionally with plants of a similar nature: They grow for a time until they exhaust their own vitality, and having failed to put out roots to produce more energy, growth ceases. Imperfect storage or late planting is usually responsible for this.

### The Vegetable Garden.

**Celery.**—During the continuance of the hot days all celery should be frequently cultivated so as to conserve, as well as to prevent any evaporation of, moisture. Whenever the ground becomes very dry a thorough soaking of water is of great importance, and if water be given at all it must be applied so that the ground is well soaked to a depth of at least six inches. When given in a proper manner the water will reach the roots, which will then withstand drought and grow during the hottest weather without check, and the plants will possibly not need more watering for a month. If watering is impracticable, as unfortunately is often the case, efforts should be directed to procuring a suitable mulch, applying this material between the rows. If lawn rakings are kept they are very suitable for the purpose. Utilize every cloudy day, especially when rain is in prospect, to set out plants for the winter crop.

The melon worm is at times quite destructive, as it feeds upon the leaves and fruit; as soon as detected sprinkle hellebore on the leaves early in the morning while dew is yet on.

The cucumbers should be regularly picked off clean and none allowed to run to seed, otherwise their vitality will soon be exhausted. The larva of the striped beetle is a small worm feeding upon the roots and is about an inch long. The beetle itself is about one-fourth inch long and feeds upon the leaves. The best thing to do for them is to spray with Paris green. This should not be done after fruit is half grown. Keep off all insects on time!

The greyish-green louse frequently attacks the underside of the leaves of both the cucumber and melon plants, especially after a hot, dry spell; it multiplies very rapidly and the first appearance should be carefully looked for. Destroy by pulling up the entire vine, if it be badly infested, or take off the leaves and burn. If a few only are scattered over many vines it is best to bring in the aid of the force pump and spray the underside of leaves with the kerosene emulsion, which kills by contact; hence, it is necessary to cover the whole plant with a fine mist to successfully combat the pest.

The asparagus bed should now be allowed to grow. Encourage growth as much as possible by keeping down weeds and frequent cultivation. By reasonable care and attention the bed should be as good at twenty years of age as at five.

**Successional and Constant Crops.**—At this season when all the crops are coming in, the individual who plants is judged as to his competency. If he has followed the directions given in these columns, fresh peas, cauliflowers, celery and other vegetables should be had uninterruptedly. We frequently notice in many gardens that crops are coming in together; for instance, a great abundance of peas may be picked one week, none the next, and during this interval possibly there is a large party to be entertained, and plenty of fresh vegetables are called for and expected; but things are "off crop." This is not as it should be and is evidence of mismanagement and want of foresight at planting time. It is much more satisfactory to all concerned to be able to gather, through the season, fresh vegetables in just sufficient quantities to go around. These matters are very easily adjusted by a little study at planting time, and the faculty for this should be constantly exercised and cultivated; for without it success is impossible to attain in any of the many garden operations.

The Gerkim Cucumber for pickling may still be sown.

**Egg Plants.** Pick off all potato bugs every morning, if possible; otherwise, treat as advised in former issues.

W. M. EDWARDS, Conn.

### On a Connecticut Fruit Farm.

The strawberry field meeting of the Connecticut Pomological Society, held June 15, at the fruit farm of President J. H. Hale, south Glastonbury, brought together over 250 of the leading fruit growers of Connecticut and adjoining States. The outing was a complete success from beginning to end, reflecting credit both on the society and the genial host.

To most of the visitors the centre of attraction was Mr. Hale's trial bed of strawberries, containing forty-three of new and old varieties, grown for a comparative test. To say that it was a grand display of vigorous plants, healthy foliage and large, handsome fruit, but faintly expresses it as an object lesson of what the various varieties of berries will do when given the best care and most favorable conditions. It would be almost impossible to pick out from this great mass of fine fruit the best varieties, but several of the newer sorts that promise remarkably well deserve mention.

The Clyde, Mr. Hale's favorite berry, showed a wealth of berries of fine form and size. Tennessee and German ranked first in size, while Brandywine, Glen Mary, Bismarck and Isabella attracted much attention.

Many acres of field strawberries were seen with arrangements for irrigating the same. An interesting sight was made by the big peach orchards, containing about 8,000 trees loaded with fruit, and as many more young trees not yet in bearing.

Mr. Hale's place is beautifully located on high ground, embracing a view of the Connecticut River, the farm being tastefully laid out and excellently cared for. Perhaps the most noteworthy fact on the whole farm is the system of clean cultivation that is practised. The soil is kept loose and friable and not a weed is to be seen.

After a bountiful lunch under the trees the company assembled for some informal speech-making. The Hon. Franklin Dye, of the New Jersey Board of Agriculture, was made chairman. Addresses were made by W. F. Taber, of Poughkeepsie, representing the Eastern New York Horticultural Society; Wesley Webb, of Dover, Del., for the Peninsular Horticultural Society; George A. Rogers, of Boston, spoke for the press; W. F. Allen, Jr., Salisbury, Md., for the nurserymen; Dr. E. H. Jenkins, of the Connecticut Experiment Station, and Professor W. A. Taylor, of Washington, D. C., for the experiment stations; J. M. Hubbard for Connecticut horticulture; Sec. Sessions for Massachusetts; T. S. Gald, of Connecticut Board of Agriculture, closed the speaking.

A vote of thanks was tendered President and Mrs. Hale for their hospitality. A very large addition was made to the membership of the society. The day will long be a memorable one, especially from the fact that it brought together so many of the best-known horticulturists of the country.

Other field meetings are contemplated this season.

#### Sweet Vernal Grass.

Next fall I shall sow several bushes of lawn grass seed in sandy soil, fully exposed to the sun. The summers are long and hot—drought every year—and in winter no snow to speak of, freezing and thawing being the order of weather. Kentucky blue grass does well here, but does not make as thick a turf as I want. Observing the omission of sweet vernal from lawn-mixture formulas, I wish to know if it would not be a desirable grass with Kentucky blue for lawns in the climate and soil described?—SOUTH JERSEY.

Sweet Vernal is never, or at least should not be, used in lawn mixture, being in no way adapted for such a purpose. Its chief use is among meadow grass in order to give aroma to the hay crop.

## Destructive Insects and Methods for Controlling Them.—VIII.

### Miscellaneous Notes.

PROF. W. G. JOHNSON.

In this series of articles I promised to give an occasional note upon insects that need special mention at certain seasons of the year. The editor informs me that a subscriber has asked for details about the

### Striped Cucumber Beetle.

This is a very troublesome little creature and by its depredations inflicts heavy damage upon the vegetable gardener. It confines its attacks almost entirely to the cucumber, melon and squash.

It is a small beetle, scarcely a quarter of an inch long. It is represented in the accompanying illustration. It is yellowish with a black stripe along the middle of each wing cover and with a narrow black border. These beetles feed voraciously upon the young, tender plants and delight in accumulating on the stem near the ground, gnawing into the plant. The female deposits her eggs in the ground near the stem and roots.

The young hatching from these eggs burrow into the stalk. They complete their growth in about a month. The worm is very slender, whitish and about one-third of an inch in length, as seen in the illustration.

### Remedies.

Very many methods have been used for the destruction of this pest, but only one or two are of any practical value. Some persons who do not grow extensively for market protect their vines during the critical time with screens or netting, supported on wooden or wire arches. Some growers resort to driving; that is, they actually drive the beetles from the fields by the sowing of plaster or air-slaked lime. This, of course, must be followed up persistently.

Others apply Paris green and plaster at the rate of one pound of poison to 75 or 100 pounds of plaster, and dust it upon the plants. Tobacco dust can be used to good advantage about the base of the plant to keep the females from depositing their eggs.

Some growers use hard-wood ashes for the same purpose. Ashes or sawdust saturated with turpentine or coal oil will also repel the beetles to a certain extent.

### Remedy for Ants in Lawns.

Some readers of American Gardening of June 19 asked for a remedy for ants on lawns. Ants or any other subterranean creatures can be destroyed by the liberal use of bisulphide of carbon. This is a foul-smelling substance, as clear as water, very volatile, the fumes of which are heavier than air. Its fumes create a death atmosphere in which insects cannot live.

In applying this material in lawns where ants are numerous the main runways or galleries should be ascertained; then saturate a small bunch of cotton with the bisulphide and thrust it into the hole, which should be heeled over. The fumes will penetrate the burrows and destroy the ants. It must be borne in mind that this substance is inflammable and no lights should be in its vicinity.

A grade known as "Fuma Bisulphide of Carbon" can be bought in 25 and 50-pound cans for about ten cents per pound, or in smaller quantities for a little more per pound. A can of this should be kept on hand constantly and whenever the ants show a burrow at the surface of the ground they should be treated as described.

The same remedy is an excellent one for moles. Their runways, when they enter deep into the ground, should be found if possible and the bisulphide and cotton applied as indicated above.

## Roses Under Glass.

When we have finished planting it is then that rose growing commences in real earnest. To be on time and watch the proper requirements of our plants constantly will not only repay us now, but likewise in the future.

When visiting florists who have had rather poor success in growing roses, I am under the impression one of the chief causes of their trouble is improper ventilation. I believe I am right in saying that ventilation is not as thoroughly understood as it should be by many and that more err on the side of not giving enough than too much. It should be borne in mind that although a rose grown under glass needs the most careful and painstaking treatment, still that should not be construed into meaning coddling. Knowledge, experience and courage are three things that we must possess to ventilate properly. In visiting different establishments I notice quite a number of growers close up their houses at quitting time, no matter what the state of the weather is, while others, if it be warm, but cloudy, with a little breeze blowing, will either close ventilators up tight or have such a small particle of air on, that the atmosphere inside becomes too humid. I have asked quite a number why they don't use more air, and was invariably told that they are

FIG. 136.—THE STRIPED CUCUMBER BEETLE AND LARVA. (MAGNIFIED.)

afraid to. What there is to be feared from the warm, summer air is a conundrum to me.

It may be well for me to mention here that it is very possible (in fact, I have seen it done) to produce a very pretty-looking house of roses during summer by keeping the plants rather close and shady, likewise by using a mulching of manure; but they most generally cut a very sorry figure when the sun begins to lose its power in the fall. The leaves fall and the plants become so sickly that they are an easy prey to various fungus diseases, consequently what few flowers are cut are very inferior in size, texture and color. While others that have been brought up with an iron-clad (if I may term it) constitution as soon as more artificial means are brought into play in the fall, instead of going backward, quickly respond to these means, and an improvement on nature then commences. Every successful grower fully realizes the vast importance at this time of the year of storing up vitality in his plants to tide them over the bad days of early winter.

I am a great advocate of lots of fresh air and a circulation through the plants at all times. As stated before, there are still some who don't seem to grasp its great virtue. During the warm summer time I keep all the air on possible, night and day, reducing only when rain, wind and thunderstorms occur, according to the severity of these; also in sudden cooler changes in the atmosphere. I do not know of any other plant that is more susceptible to sudden changes of temperature, or, in fact, checks of any kind, than the rose; hence the necessity of constant atten-

tion. It sometimes happens a storm comes up in the night during our hottest weather, then the sooner we close up for the time being the better. As far as wind blowing directly on the plants is concerned, I don't like it, if it causes a draught or strong, dry-air current; still, I like to see a breeze gently waving the bushes to and fro.

Now, I would not advise, where plants have been kept close and properly shaded, to give them the treatment I advocate right away; better gradually accustom them to it by giving a little more air each day and partly removing the shading, until in about three weeks' time clean glass is reached.

It is a mistake for us to go by date or season as regards heating, ventilating and watering. To go by outside conditions day by day, as they occur, is proper; at least, I have always found it so.

This season has been a very remarkable one in this section—almost continual northwest winds, accompanied by cold nights, the thermometer often going down as low as 45 degrees. This has not only necessitated reducing our air to about two inches, but firing also has had to be done.

It is no uncommon thing to hear some say that they either cannot afford, or it is too expensive to give a little gentle heat to roses during summer when needed. For the little extra outlay and the great benefit derived therefrom, my conclusion is that people with no larger reasoning powers can make but a very poor showing as rose-growers.

Surely, this season has taught many a lesson about mildew. H. H.

## The Fruit Garden.

**Raspberries.**—Superlative is doing well; the first picking from it was made June 23. Looking over my other kinds, it will be a week or ten days before the first of them will be ripe.

**Japanese Wineberry.**—If you don't want it as a fruit, buy it for an ornamental shrub. There are many less attractive plants on the lawn just at this season, especially when a brisk breeze shows the silver underside of the leaves, mixed with the dark green of the upper surface. These, with the large bunches of the red, hairy calyx, which covers the fruit until ripe, make it a taking plant at this comparatively dull time among shrubs.

**Strawberries.**—I revert to these again to fulfill my promised note as to which would finish best—Marshall or Brandywine. My preference now, July 2, is Marshall.

**Grapes.**—The bagging should be completed. It is of no advantage to bag when the bunches are half-grown. I find it well to have two people at the work, one puckering up the mouth of the bag about the stem of the bunch, holding the bag by thumb and forefinger, while the other makes a tight tie about it, directly below the first man's fingers.

**Rubus sorbifolius.**—The strawberry-raspberry has a rather tough appearance just now. Who has found it a satisfactory fruit?

**Gooseberries.**—The Downing is small when compared with Industry, yet it is the best berry for cooking.

**Currant Worms.**—These will crop out several times this month on the currant and gooseberries.

J. HOLLOWAY, L. I.

**Cape Fruit.**—The Afrikander has entered the lists against the American fruit exporter in the English market and the trade is steadily growing. The months of January and February saw in London several tons of peaches, nectarines and pears from the Stellenbosch district. This was followed by extensive shipments of grapes from the Paarl, Wynberg and Constantia districts, the average shipments per week for the last three months amounting to two tons.

## Bisulphide of Carbon.

I should be glad of space in your valuable paper to give your numerous readers my experience, also the experience of others in the use of this, one of the cheapest and the most destructive of insecticides.

Considering the continual increase of insect pests and the enormous amount of damage done annually by them, it behooves every one to consider the best and cheapest means of exterminating them. They are our common foes, causing annually millions of dollars' worth of damage, and all persons who can should assist as far as possible in their destruction.

Bisulphide of carbon, a compound of sulphur and carbon, formed by passing sulphur fumes over superheated charcoal, is a clear liquid heavier than water, and volatilizes with great rapidity. The vapor is more than two and a half times heavier than air; and from its inflammable nature its manufacture is accompanied by no slight danger. The vapors are also unwholesome and their entire confinement is quite impossible. From these causes the liquid retails at a high price. If purchased from the manufacturer, Mr. Edward R. Taylor, Cleveland, Ohio, in 50 or 100-pound cans, it can be purchased for about 10 or 12 cents per pound, including the can. The freight rates would be the same on 50 or 100 pounds.

The vapor from this liquid is a most powerful insecticide. It is superior to ether, chloroform and gasoline, and far less expensive than the first two, and no more dangerous to use than the last.

### Storing.

All receptacles that contain bisulphide of carbon should be kept securely corked and placed in a shed or outhouse away from fire or light, and should never be kept in the house; neither should the vessel be uncorked nor the substance handled in any place where there is a lighted lamp, candle, match, pipe, cigar or fire of any description. While using it care should be taken not to inhale the fumes more than is possible.

### Use in Buildings.

In buildings, houses, mills, granaries, etc., the structures should be made practically air-tight by stopping all crevices, and when sufficient time has elapsed for the gas to complete its work all doors and windows should be opened to allow the vapor to escape, and no light of any kind should be admitted till all smell of the gas has escaped.

### Insects in the Ground.

To destroy insects in the ground it is well to have a piece of gas pipe, about three feet in length and two inches bore, into which is fitted a round plug pointed at the end and six inches longer than the tube. By inserting this instrument into the ground and then withdrawing the plug, the bisulphide can be poured down the tube, which is then at once withdrawn and the hole immediately stopped so the gas will permeate through the soil and kill every insect within range. The grape phylloxera, a minute plant louse, which attacks the roots of the grape vines, may be destroyed by making holes 10 to 16 inches deep, one and a half feet apart, and one foot from the base of the vine, putting into each hole about one ounce of the liquid. One dose will generally suffice. It takes from 175 to 300 pounds per acre. Apples, pears, peaches and other fruit trees can also be similarly treated for root insects.

The same quantity as named above, if put into holes made in ant hills, is successful in its effects; for prairie dogs, gophers, etc., one pound will be enough for twenty-five holes. The liquid may be poured directly into the holes or poured upon some cotton waste, previously tied to a piece of stick, and that pushed well down into the hole, which should be quickly closed to.

For ridding mills, granaries and other buildings of insects, mice, rats, etc., the windows and all other outlets should be made as tight as possible. Have a ladder reared against the outside of the building and reaching to a top story window; upon the floor of each story place a pan or dish capable of holding sufficient liquid and commence with the lowest floor. Take the can of sulphide, go inside, close the door, pour a portion of the liquid into the pan, go up to the next story, do the same, until you reach the top one, then get out upon the ladder, close the window and the business is completed. One pound of liquid to each 100 bushels of grain will be enough; still several pounds may be used without injuring the grain; infected grain is generally subjected to the bisulphide treatment for twenty-four hours; but may be exposed much longer without harming it for milling purposes. If not exposed for more than thirty-six hours its germinating powers will be in no wise impaired. Badly infested buildings should be treated about every six weeks in warm weather. After fumigating and before entering the building again the doors and windows should be thrown open and no one should be allowed to go in until all odor of the gas has escaped.

### Seeds.

The large seedsmen are using this liquid to kill the weevils in peas and other seeds; they have houses (bug houses) made air tight, which they fill with sacks of peas, etc. An air-tight flue at one end opens at the very top, into the building and at the bottom out of doors. A sort of shoot with an adjustable air-tight valve is arranged to facilitate the turning in of the liquid, which is continued till the odor shows that the vapor is pouring out at the bottom of the flue. It is then, of course, they know that the air has all been forced out by the vapor, and the valve is closed and left for three days, when the doors are opened and the weevils, rats, mice, etc., are found dead.

Bisulphide of carbon may be poured upon the surface of flour in a barrel so as to kill all the insects that may be in the flour; it will not injure the flour for eating purposes. The barrel should be covered with something to keep in the fumes for an hour or so—a piece of oil cloth, oiled paper, or some such thing.

### A Fumatorium.

Would it not be a good plan for every florist and seedsmen to have constructed an air-tight building into which could be placed manure or soil for the greenhouse benches or potting; also flower pots, rustic vases, pot plants, flowering shrubs, etc.; these could all be treated by the fumes of bisulphide of carbon. For every ton of manure or soil, one pound of the liquid placed in a basin or saucer will be sufficient. Leave the place closed for two or three days, according to quantity of material. Pot plants, etc., can be treated with a proportionate amount, according to quantity of plants.

### Treating Bushes and Trees.

In treating currant bushes, gooseberry trees, raspberries, strawberries, tomatoes and other growing plants: Construct a small bell-shaped tent, with iron hoops or canes, and upon this frame fasten oiled canvas or thick paper; fix a wire hook to hang from the top of the frame inside, pouring a small quantity of the bisulphide into a little toy bucket hung from this. With the handles at each side the tent can be carried along and placed over the bushes or plants. The tent should be made so it will fit close to the ground, and if carefully lifted from plant to plant there need be but little waste of liquid. The tent should remain over the trees for five, ten or fifteen minutes; a great many subjects can be treated in a short time, and all insects, caterpillars, grubs, worms, larvae, etc., destroyed.

### Other things.

Carpets, blankets, boxes full of clothes (with the lids open) and any household materials such as furs, skins, museum articles, stuffed birds, animals, etc., placed in a room for a few hours and treated with the fumes from bisulphide of carbon, will be effectually freed from all insects.

G. M. STRATTON.

### Effect on Seeds.

In relation to the foregoing we reprint the following:

**The Vitality of Seed Treated with Carbon Bisulphide.**—Circular No. 11 of the Division of Botany, Department of Agriculture, deals with some experiments that have been made for the purpose of testing the vitality of seed treated with carbon bisulphide, looking to the use of this material for the extermination of weevils and other insects that infest grain.

The common remedy advised by entomologists for destroying seed-infesting insects is to treat the seed for twenty-four hours with the fumes of carbon bisulphide at the rate of one pound to the hundred bushels. This chemical when pure is a colorless liquid with a pleasant odor. Upon exposure to the air the carbon and sulphur composing the liquid are separated, each uniting with oxygen, for which they have a stronger affinity than for each other. Thus are formed carbon oxide and sulphur dioxide, the latter being a very poisonous gas with a disagreeable odor. The statement is made that seed grain may be exposed to these fumes for thirty-six hours without injuring its germinating capacity.

The length of time seeds must be treated with the fumes of carbon bisulphide depends not only upon the resistant power of the insect, but also upon its method of attack. In the case of the pea weevil the larva is embedded within the immature seed, becoming entirely surrounded by the seed coat during its development, hence a treatment prolonged over twenty-four hours may be necessary to destroy the weevils.

Seedsmen treat peas and other "buggy" seeds on a large scale by placing the bags containing the seeds in a fire-proof, practically air-tight building devoted to that purpose, setting shallow pans holding carbon bisulphide in various parts of the room near the ceiling. After being thus subjected to the fumes for about twenty-four, sometimes as long as forty-eight hours, the room is opened and thoroughly aired.

Some writers have advocated pouring the liquid through a pipe inserted into the centre of the bulk of seeds; others suggest the use of a ball of cotton, soaked with the chemical and plunged into the middle of the pile of seeds. Both of these methods are open to objection owing to the fact that the liquid comes in direct contact with some of the seed which takes it up readily, rendering such seed extremely liable to injury from the water which is left behind, if not from a superabundance of the gas itself. Furthermore, carbon bisulphide is a very heavy gas and the upper stratum of seeds treated in either of these ways is likely to receive too little of the fumes to destroy the insects.

The department's experiments were made with thirty-three different varieties of grains and vegetables, five of cotton, two of peas, three of Indian corn, two of rice, two of common garden beans, two of Kaffir corn, two of barley, two of wheat, one of oats, etc. In all the experiments only sound seeds were taken, being, so far as possible, from a single stock in each case. Two lots of treated seeds, each containing 200 seeds of the larger species and 100 of the smaller kinds, were used. Similar lots of untreated seeds were employed as checks.

In the first series of experiments the seeds were placed in shallow glass vessels, resting on a plate of ground glass

covered with a bell jar containing a saturated atmosphere of carbon bisulphide. At the end of forty-eight hours the seeds were transferred to the germinating chamber, in which were placed also the check lots of untreated seed.

The following seeds were uninjured by this severe test, the germinating percentages of both treated and untreated seed being practically the same: Peas, cotton, beans, Kaffir corn, buckwheat, turnip, cabbage, cauliflower, pumpkin, cow-pea and oats. It is safe, therefore, to conclude that none of the ordinary methods of treating these seeds with carbon bisulphide will impair their vitality.

On the other hand, the germinative ability was decreased in barley, rye, wheat, corn, crimson clover, millet and rice, the difference between the treated and untreated seed varying from 85 per

the forty-eight hours' treatment were then subjected to another test of twenty-four hours' duration. Some of the varieties suffered no deterioration whatever in vitality with the twenty-four-hours' treatment, while there was a marked decrease in the amount of injury in all of them.

Rye proved the most susceptible to injury, with a difference of 41 per cent. between treated and untreated seed. Millet showed 17.5 per cent., barley 11 per cent. and crimson clover 6.5 per cent. difference. All differences in germination tests amounting to 5 per cent. or less may be attributed to variation in the quality of each lot of seed used, and no conclusions should be drawn from them with respect to the effect of the treatment.

In order to ascertain whether similar injury to the seeds named in the foregoing table would result from treat-

In general, seeds of cotton, peas, beans, buckwheat, oats, the cabbage family and cow-peas will endure the most severe treatment with the fumes of carbon bisulphide without their germination being injured to any appreciable extent. On the other hand, seeds of corn, wheat, rye and other crops belonging to the grass family (except Kaffir corn and oats) should be treated with caution, as serious deterioration in vitality is likely to result from excessive exposure to the gas.

### Akebia Quinata.

The accompanying illustration represents a branch of this very useful Chinese twining evergreen shrub. It is most valuable as a trailer on a trellis, fence, porch or such like arrangement and is very hardy. Left to itself it soon attains a growth of from twenty to forty feet, and once established, which presents no difficulty, it can thereafter be left to itself.

The long, slender shoots, with their gracefully-formed leaves of five leaflets, add to the elegance of any place over which it rambles. The flowers are peculiar and while not very conspicuous are interesting; they are of two sizes, fragrant, of a claret purple color, and are produced in drooping racemes.

### Chrysanthemums.

**Shading.**—Many people think that when a house is newly planted it should be shaded until the young plants get established; but such treatment is apt to be more harmful than otherwise. It might do good where the plants cannot get much attention in the way of syringing, but it will induce a long, sappy, soft growth and the only way to get a big flower is to build up the plant from the ground with a close-jointed, richly-clothed stem, finishing in the fall with foliage like leather and a stem hard as nails.

**Ventilation.**—When the house is planted throw open the ventilators, doors, sides and everywhere you can and keep them so both night and day. The atmosphere should be kept charged with moisture by spraying over the plants, roof and floors, five or six times during hot days and scald will not amount to much except where there are bad spots in the glass.

**Watering Benches.**—The soil should be kept just moist enough to allow the roots to work, but not by any means saturated, or the soil will sour and the plants begin to lose that dark, healthy gloss, the sure sign of health and good digestion.

**Planting,** if not yet finished, should be done as soon as plants are in fit condition. Do not let them get pot-bound in such a small state, for that only means a check which the plants can do very well without.

**Vivand-Morel.**—This very fine variety is, with me, addicted to the habit of throwing a bud every three weeks or so, and I believe the best way to handle it is to strike it about the first week in July and grow straight along. Late-rooted plants only produce terminal buds, and this is one of the few varieties that produce better colored flowers from the terminal than the crown buds, the crown bud flower being, as a rule, pale and of a dirty white color. C. TOTTY, N. J.

**Peanuts** grow in large quantities on the northwest coast of Africa, but are known there as ground nuts. They are dug up by the natives and bartered with the European traders for merchandise, tobacco, etc., at many places on the Gambia River, and afterward shipped in steamer loads to European ports, principally to Marseilles. The nuts are not roasted for retail sale, as in this country, but crushed and a fine oil extracted, which is valuable commercially.

FIG. 137.—AKEBIA QUINATA.

cent. in the case of rye to 9 per cent. in the chalky rice. With the exception of crimson clover, whose seed is much more tender than that of other clovers, all of the injured kinds belong to the grass family, oats alone of this group showing no injury. This resistant character of the oats is easily explained from the nature of its covering.

This method was an extreme one and represents conditions which would probably never be attained in actual practice. Here each seed, being exposed to a thoroughly saturated atmosphere of the chemical, had ample opportunity to imbibe as much of the vapor as it was capable of retaining. It is reasonable to suppose that seeds whose vitality was not affected by a forty-eight-hour test of this kind would be in no danger of deterioration in this respect from any treatment given them in ordinary practice.

The varieties which were damaged by

ment in bulk, one bushel each of wheat, rye, barley and field corn were subjected to a second series of experiments. One bushel of each kind of grain was placed in an air-tight bin for twenty-four hours. Upon the surface of the grain were shallow glass vessels containing carbon bisulphide in the proportion of one pound to one hundred bushels, as recommended by the Division of Entomology of this department. At the close of the twenty-four hours lots of each variety of seed, both treated and untreated, were germinated in duplicate.

As a result of these experiments the following conclusions are arrived at:

No appreciable difference in the vitality of wheat, corn, barley or rye results from treating the seed in bulk with carbon bisulphide for twenty-four hours at the rate of one pound of the chemical to one hundred bushels of the grain.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DELAMARE PTO. & PUB. CO. LTD.

ROSE AND DUANE STS.,

RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt.

## Publishers' Announcements.

Cheques, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

*\*\*\* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.*

**The Fruit Market.** WHILE it may be early as yet to speak with any great degree of certainty as to the prospects for the present season's fruit crop, yet there are certain features that demand attention. We naturally have our greatest concern and interest in the welfare of the Eastern fruit grower. His crop prospects this year are generally very good, and as a corollary his prospects as regards prices realized will depend solely upon how he markets his produce.

Californian fruit will this year be put upon our markets in considerably larger quantities than it was last year, as reports from the Pacific coast inform us of a much greater yield over a larger area. Already the growers of the district are alarmed over the prospect of low prices, and are bringing pressure to bear on the railroad companies to secure lower rates for transportation.

"Coming events cast their shadows before," and as evidence of the coming flood of California fruit on the New York markets reference can be made to the statistics to hand for the past week when 50 carloads were sold as against 30 for the corresponding time of last year, making a total of 174 carloads to date, as against 106 carloads during a like period of a year ago. The full significance of the foregoing figures is not on their face value, since it must be remembered that this year has been cold so far and the calls for fresh fruit are not so great in cold as in hot weather. The shipments of cherries up to the middle of June were 2,769,020 pounds, more than twice as much as the entire shipments of last year, and more than the total shipments of 1895.

So much then for the conditions. How are they to be met? There is but one way out for the home grower; it is the old story, yet cannot be too often impressed: Grade strictly and pack well. It is the worst folly to endeavor to pass off a few poor specimens in a lot of otherwise first grade fruits, for the wholesale buyer is trained to detect such and naturally bases his offer on the worst seen. Strict grading as to size is of as great importance as quality and condition, and uniformity in all respects must be striven for.

## Canada and the U. S.

The Dominion Government purposes to at once introduce a measure in Parliament to prohibit the importation from the United States of trees and shrubs and certain classes of fruits. It is asserted that the introduction of the serious pest, San José scale, is the result of such importations from the United States. A convention of the horticultural societies was held at Hamilton recently to urge the necessity of taking legislative action to prevent the spread of the San José scale among the fruit orchards.

If the proposed legislation is enacted nursery trees from the United States will be excluded from Canada; and, as the scale also affects fruit, the fruit growers demand that the importation from infected States of fruit shall also be prohibited.

**Victorian Medal of Honor in Horticulture** has been instituted by the Royal Horticultural Society of England as a memento of the Queen's Diamond Jubilee. It will be awarded to persons who have rendered distinctive service to the cause of horticulture in any of its numerous branches—botanists, cultivators, hybridizers, introducers of novelties and writers are equally eligible, and not more than sixty medallists shall exist at one time. The distinction thus to be bestowed will, therefore, create a hallowed circle, to which admission will be a much-coveted honor.

The routine of the Government has its effect on high and low alike in the Federal service. According to the Washington correspondent of the New York Sun, one of the employees under the White House gardener is assigned to the duty of watering the flowers and lawn in front of the mansion at a certain hour every afternoon. It was raining hard at the regular time the other day, but the assistant gardener followed custom. He calmly arranged a hose, indifferent to the downpour, and then walked around the flower beds sprinkling the drenched plants.

## Paulownia Imperialis.

The illustration on page 485 shows one very satisfactory way of treating this tree. The growth represents is that of two months only and where a tree is not desired, but only rich foliage effect, such can be had by annually cutting the growth to the ground, the stump then throws up strong shoots which develop large leaves and are highly decorative in many situations, as on the margins of a lake. Our photograph is from a specimen in the gardens of Hon. Gardiner G. Hubbard, West Washington, D.C., and was communicated by the gardener, Mr. P. Bisset.

## Strawberries.

### Summer Planting.—Varieties.

I was interested in your report of the American Institute Horticultural meeting on June 8, as published in your issue of June 19.

Mr. Dwyer gives some excellent points in relation to strawberry culture, but I shall take issue with him as to the general profitableness of summer planting of strawberries on any extended scale for market. The plants cost too much and unless one has a liberal amount of water it is seldom that a good stand can be secured.

At his estimate of cost, 2½ cents per plant, to secure a profitable fruit crop next year one would need 20,000 plants per acre, which would make first cost of the plants \$500, altogether too risky an investment, when the plants for setting an acre can be bought in the spring for from \$18 to \$25.

Summer planting is all right for a family garden, where it was neglected to plant a bed in spring, or for the purpose of getting a few fancy, showy berries; but for market culture not one person in a hundred is so situated that they can afford to buy plants and embark in the business by mid-summer planting.

In the way of varieties, Mr. Dwyer's experience is that of all the rest of us; that strawberries are a good deal like "white folks," mighty "unsartin"—they do well under certain conditions and break down entirely under others. His list of Marshall, Brandywine and Parker Earle as the three leading varieties would be way off for this section of the country. In my trial bed of forty-three varieties this past season Marshall was the least productive of any variety I had, and while Brandywine was large and fine, it was inferior in yield to at least six others.

In my ground this year for productiveness and large, uniform size, Clyde was way ahead of anything else, Parker Earle and Tennessee second, Isabel and Haverland third, Glen Mary, William Belt and Greenville fourth, Bismarck, Orlole and Ideal fifth, Brandywine and Michigan sixth.

Columbian and Michel's Early were the earliest to ripen; Michigan and Princeton Chief the latest. German, William Belt and Bismarck were my largest berries, Crescent and Beeder Wood the smallest. William Belt and German were the highest flavored of any, while the Ideal for uniform, typical strawberry shape, rich, glossy, red color, and sprightliness of flavor, although somewhat acid, certainly deserves the name of "Ideal."

J. H. HALE.

**Manhattan (Kan.) Horticultural Society** met at the home of Rev. R. D. Parker, in Manhattan, on June 24. Rev. Tunnell read an interesting paper on "What I Saw of Horticulture in California." President Fairchild gave a pleasant talk on "Reminiscences of Horticulture" and Mrs. Sam Kimball read a very practical paper on "What Boys and Girls Can Do on a Fruit Farm."

Heavy winds and hail have injured the fruit in places.

**Georgia State Horticultural Society** will hold its annual gathering at Savannah on August 4 and two following days.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

## How to Get Rid of Rose Bugs.—Mr.

L. F. Horner inquires in American Gardening of June 19 for some effective way of destroying rosebugs. The simplest and most effective way I have ever found is to plant a Clinton grape vine. For some reason this is peculiarly attractive to the little pests, so much so that I have often found my Clinton vine swarming with them when other varieties of grape in the immediate vicinity were almost unvisited by them. And, as the Clinton grape is almost worthless, one can well afford to use the vine simply as a trap for the rosebugs. For gathering them thus in large numbers upon a single vine it is very easy to destroy them with great rapidity by holding a cup of hot water underneath and by a slight disturbance of their feeding ground, causing them to lose their hold and drop into it.—W. H. W.

**Ants on Lawn** or anywhere else can be very easily and quickly killed in the following manner: Find their nest and make an opening into it or into the ground near it with a small, round stick. Into this opening pour a tablespoonful of bisulphide of carbon and the work is complete. If the ant nest be a very large one and occupied by thousands of ants, as is the case quite frequently in the South, more than one tablespoonful of the liquid may be necessary. The bisulphide is also excellent for killing ants and other insects in greenhouses and dwellings.—C. S. NEWMAN, Ark.

**Struck the Key Note.**—You struck the key note in your recent article entitled "Arouse Ye." How often do we see grounds surrounding a nice, well-built cottage, all growing up in weeds, and, worse still, some part of it used as a dumping ground for all kinds of rubbish. We may well ask the question why is it? And not only is this the case in the city, but in the country, where we have Nature, the master gardener and florist, to teach us, we find the same condition of things, and why? Some there are of the "I don't care" kind, who would not know a cowslip from a telegraph pole, and who would just as soon have their surroundings a swamp as anything else; but there are others who do not improve their home grounds for the reason, as they think and say, "I don't know how; I am not a gardener, and can't afford the cost of getting one to do the work." To all such I would say, as Lawrence said, "Don't give up the ship," for you will be surprised if you make an effort to improve and refine your surroundings how much you can accomplish even if you don't know how. My advice would be, watch and follow nature, for the nearer we can copy her the greater are our results. I have in my mind now a small lot that is tended entirely by a lady; the cost of flowers and other plants does not amount to four dollars a year, and yet it makes her home and surroundings attractive and home-like. What one has done others can do.—F. C. R.

**"To criticize is easy"** (page 442, third column) from your own standpoint. Very seldom does the critic know all the facts in the case, however, and therefore "criticism" is of little value except to draw out an explanation of conditions and personal practices. If these do not agree with the old-established

usages the writer is denounced as a humbug, or as a crank, a liar, or a fraud with an axe to grind; never as a person desirous of helping others in the same line of business as himself. Methods must necessarily vary with locations and conditions, and there can be no set rules laid down that others can follow implicitly, even on the same land year after year. Intelligence and judgment of the highest order are really imperative to secure the ideal result. Alas! how often we fail! Even those that are quoted as "authorities" fail to be successful at times, but those failures are not paraded before the public, lest they deter others from trying. Examples or object lessons are the most potent factors in inducing a change in the surroundings of the usually unkempt appearances of the average home grounds. How few own them! Make improvement the fashion and a rapid change will soon be apparent; enlist the attention of the younger people, even of the small children, to the improved fruits, flowers and vegetables by exhibitions and "talks" (not lectures) on the subjects, with a distribution of seeds and plants in the spring (Arbor Day, for instance). Seedsmen send out free samples of novelties; why should not the florists send each school district small packets of the cheaper flower seed to create an interest in floriculture as well as horticulture? Apply the government seed distribution to this purpose instead of using it for a political pull. Surplus copies of the horticultural and agricultural papers could be used with good effect; even a sample copy to the teacher, requesting reading before the scholars instead of the usual request to subscribe, would do very well. One other thing: The suppression of articles reflecting upon the veracity of writers who have an understanding of the capability of the production of soils and its offsprings.—H. SNYDER.

**Strawberry Col. Cheeney.**—Will R. C. P. (page 459) please tell us where he gets his Colonel Cheeney strawberry plants? I have searched the catalogues for them in vain. Is the variety ever called the Kentucky?—M. J. B., Mich.

## The Pear Leaf Slug Worm.

The worm injuring the leaves of quince trees sent by W. E. F. is known as the "pear slug" (*Selandria cerasi*). It feeds on apple, pear and cherry, as well as on quince. This insect passes the winter in the ground in what is called the pupa or resting stage. It issues from the ground as an adult insect during the months of May and June. In the adult form it resembles a fly and is called a "saw-fly," but it is more closely related to the bees than to the flies. Soon after issuing from the ground the adult fly commences to deposit her eggs in small incisions which she makes in the leaf tissue with her ovipositor or saw. The eggs hatch within a week or ten days after being deposited. The worms or slugs, as they are usually called, feed for about two weeks, when they enter the ground and go through the resting stage. Here they remain until the latter part of July, at which time they issue as the second brood of adults. The second or last brood of worms passes the winter in the ground in the resting stage. The worms simply eat the parenchyma or green portion of the leaves. This causes the burned appearance of the leaves. Trees rarely die from the first attack of this pest, but they have to put forth a new set of leaves and are weakened as a result. Continued attacks will kill the trees. Spraying with Bordeaux mixture, to which Paris green or London purple is added at the rate of four ounces to every barrel of the mixture used, is the most thorough and practical method of destroying this pest. Hellebore or "slug shot" blown onto the trees in powder form will destroy many of the worms.

## FRUITS OF EXPERIENCE.

## JOTTINGS FROM OBSERVATION.

The garden rake is a valuable tool to use among raspberry plants. We are now using it to kill the fine weeds just appearing on the surface of the ground, and at the same time to leave a "dust mulch." It is a pleasure to look down between the rows after the garden rake has passed among them and see the smooth, strictly clean and even surface, the green and luxuriant foliage responding to the extra cultivation given.

During the growing season a straw or "dust" mulch should be left between the raspberry rows; the latter is to be preferred if kept stirred once each week during the drouthy part of the season.

A plantation of strawberries here has been cultivated seven times since being set last spring. The strong, heavy growth and glossy leaves during this dry spell prove that there is big profit in cultivating often.

A sharp hoe for keeping the red raspberry suckers cut off.

The average price for strawberries this season has been low, but the large, showy varieties and those grown in hills have brought a fair price in the home market, but many growers in Michigan have not received satisfactory returns from shipments, especially to large cities.

Happy is the small fruit-grower who has "worked up" a good home market, and by strictly fair and square dealing holds it.

From my own experience as regards strawberries, my home house-to-house market has brought in the best results.

C. has not removed the old canes from his black raspberries. What a nuisance in the way of cultivating and hoeing and a propagator of disease! He tries to farm and grow fruit at the same time, and doesn't make a success of either, although he is an industrious and enterprising man; he has "too many irons in the fire."

June 29; strawberry-picking is now practically over, and we will run a mowing machine over the patch, let all dry, scatter a little straw on the thinnest spots and burn.

After fruiting, pull up the pea vines, work up the ground well, level off with a weeder (or, if the patch is small, the garden rake can be used), and there is a good plot on which to sow late turnips. Sow broadcast, and rake in.

Excellent greens—the beet and radish leaves cooked with a small piece of salt meat.

A lady near Jackson, Mich., grew, picked, "cured" and sold thirty dollars' worth of the large English broadleaf sage from not more than a half-dozen rows each about 10 to 12 rods long. The market was among butchers and druggists.

So often should the surface be worked over among onions that the smallest weed will not be allowed to appear.

Horticulturists are sowing more green peas this year than at any other previous time to plow under for a fertilizer. Experiments with them last year are proving very satisfactory in the extra growth of small fruit plants where they were plowed under.

B. says lime (air slacked) is a good remedy for the leaf roller on spring-set strawberry plants.

The articles in American Gardening on "Destructive Insects and Methods of Controlling Them" will be of much value to the amateur who wishes to keep his fruits, etc., in the finest shape. Tariff or no tariff, the weeds will get ahead of us unless we keep them down.

June 29th; Farmer raspberry is coloring up for ripening.

Princess strawberry was of good size this season. CHARLES NASH.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send stamp for our new catalogue.

## Preservation of Farm Profits.

Anything that will save labor will save money. The difference between the high lift necessary to load a wagon on high wheels and the labor required to load the Low Handy Wagon represents so much vital force and physical energy. The man who saves that energy and force, other things being equal, will live longest. Why do a thing the hardest way when there is an easier and quicker way?

The cut shown herewith represents a modern Low Handy Wagon, which is being supplied by our advertising patrons, The Electric Wheel Co. of Quincy, Ill. These people manufacture the wheels themselves and are supplying the gear at cost in order to introduce the wheels, which are of the modern wide tire pattern, with staggered oval steel spokes. The Electric Wheel Co. also make wheels that will fit any wagon you may have on hand, or any cultivators, drills, cuts, etc.

## A Plea for Garden Roses.\*

(Continued from page 472.)

### Insects and Diseases

And now for the insects and diseases. These could be dilated upon to a wearying length and then all that might, could or should be said would not be said, so I will be as brief and concise as possible. The first in the animal line is green fly. This is one

FIG. 138.—LOW HANDY WAGON.

of the most common, but fortunately the most easily destroyed of any insect that attacks the Rose, as it succumbs to tobacco in any form; the most convenient being tobacco dust, which should be liberally scattered over the plants, and be sure that it reaches the under side of the leaves, first wetting the foliage so that the dust will adhere to it. This should be done as soon as the plants start to grow, so as to prevent the insects from gaining a foothold, in which case it is very difficult to get rid of them.

The Rose beetle, Rose chafer, or rose bug, that "pesky critter" which eats up the young buds and tender leaves, almost defies destruction. He is invincible, usually because of his numerical superiority, but hand-picking and knocking off on sheets early in the morning, also a liberal use of the powder bellows and pyrethrum powder will get away with him. Open vials of bisulphide of carbon hung among the plants is an efficacious remedy; but I think most people would tolerate the bugs sooner than the remedy.

The rose leaf hopper is another annoying pest. Treat him to whale oil soap or kerosene emulsion and treat the rose slug to the latter beverage also; they don't like it and it doesn't like them, so get them together and let them fight it out to a finish.

The root gall-fly is a small larva which attacks the roots, producing galls, causing a rapid loss of vitality and eventually killing the plant attacked. The only sure remedy is to dig the plants up root and branch and burn them when found to be badly affected.

Mildew is a species of fungus gen-

\*Paper read by Mr. P. O'Mara, at the Annandale (N.Y.) Rose Show, June 16, 1897.

erated by exposure to chilling winds, and is apparent by the presence of a grayish white film on the affected parts. It is very hard to effect a cure in the open air, where the conditions which produced it are beyond control; but it can be held in check by dusting the plants with flower of sulphur.

Black spot is a parasitic fungus which manifests itself in the form of round or irregularly-shaped black spots upon the upper surface of the leaves. Generally only the full-grown leaves are attacked and the disease gradually spreads through them, destroying the circulation of the sap and causing a premature fall of the foliage. The Moss Roses, Hybrid Perpetuals and the Hybrid Tea Roses are more subject to this disease than are the Teas or Monthly class. There is no known certain remedy for it up to the present time. The only thing to be done is to pick off and burn all affected leaves so as to prevent its spread, as it is quickly contagious. It is usually a consequence of an injury to the roots, either by an excess of moisture or an excess of drought. When grown out of doors the danger from drought may be remedied by watering; but nothing can guard against injury from dull, wet weather. Spraying with Bordeaux mixture before the leaves unfurl is a preventive. Rose leaf spot is usually found where there is poor drainage and in crowded corners, or when the plants are too thick. Reverse these conditions to get rid of it and burn diseased parts.

Rose rust is another form of fungoid disease, which can be checked by using the copper fungicides. Cleanliness, preventing overcrowding and good cultivation are the best safeguards, however, against all.

(To be continued.)

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues notes here. They are sent free to our readers except when otherwise stated.]

E. H. KRELAUGH & SON, Haarlem, Holland.—Wholesale Bulb list for 1897.

DAN'L B. LONG, Buffalo, N. Y.—Priced Circular of the Wm. Scott Strain of Primulus.

FLORENCE ANTHONY, Reading, Pa.—Circular of New Single White Geranium, "La Purite."

SCHLEGEL & FOTTLER, Boston, Mass.—Special Price List of Bulbs for Import Orders.

HORACE RIMBY, Collegeville, Pa.—Price list of Greenhouse, Bedding and Vegetable Plants.

GOULD'S MFG. CO. Seneca Falls, N. Y.—Special circular of New Double-Acting Well Pumps.

AUGUST ROLKER & SONS, New York.—Special Offer of Bulbs for Late Summer and Fall Delivery.

JACKSON & PERKINS CO., Newark, New York.—Price list of Cumberland black cap raspberry, new.

MRS. THEODOSIA B. SHEPHERD, Ventura-by-the-Sea, Cal.—List of Novelties and Specialties for Fall Delivery.

PURDUE UNIVERSITY, Lafayette, Ind.—Announcement of Courses in the School of Agriculture for 1897-98.

PETER HENDERSON & CO., New York.—Midsummer Catalogue for Summer Planting. Strawberries, vegetable seeds, etc.

LUDWIG MOLLER, Erturt, Germany.—Catalogue of German garden literature containing a list of over a thousand horticultural books, pamphlets, etc.

H. H. BERGER & CO., 220 Broadway, New York, and San Francisco, Cal.—Wholesale Price List (Japan List) of Bulbs, Flowering Roots, Plants, etc.

E. A. ORMSBY, Melrose, Mass.—Pamphlet relative to the Ormsby Ventilating System, contains a list of parties who are using and endorse the system.

JOHN LAING & SON, Forest Hill, London, S. E., Eng.—Descriptive Catalogue of Tuberos Begonias; Special Catalogues of Caladiums, Dahlias, Carnations, Pinks and Cannas, and Bedding and Border Plants.

DAN'L B. LONG, Buffalo, N. Y.—Catalogue List of Long's Floral Photographs. These useful adjuncts to the retail trade are meeting with considerable favor; the large assortment to choose from renders this list very valuable.

## A Word on Drainage.

There is very little land in this country that may not be materially improved by tile draining. Much land that is naturally wet is slow to dry out in the spring. Tile it; it will advance the season two weeks and often more than that. Land is improved by the admission of air, and there is no better way of admitting it than by the under-drain, which, when it has carried off all surplus water, carries back to the earth a current of warm air—ideal treatment for cold, clammy soils. Henry F. French, in his admirable work on "Farm Drainage," says: "The simplest, cheapest and best form of drain-tile is the cylinder, or merely a tube, round outside, and with a round bore."

## Business Cards.

C. D. ZIMMERMAN, Buffalo, N. Y. Horticultural Landscape Gardener. Plans and estimates furnished. Mention American Gardening when you write.

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied by work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. J. O. Forsyth Johnson, P. O. Box 102, New York City.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance. The address will be charged as part of the ad., and each initial or a number, counts as one word. No cuts or display type allowed.

HULANBOECH BROS., bulbs and plants, Englewood, N. J.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York.

TRANSPLANTED CELERY PLANTS, all the leading kinds. John A. Smethers & Son, P. O. Box 104, Berwick, Pa.

WANT to exchange good Bauach and Lomb microscopes for horticultural books. Write for particulars. Sid Yancey, Covington, Ga.

DO YOU WANT the best flower pots? If so, send address to The Whilldin Pottery Co., 715 Wharves St., Philadelphia. Three shipping points, can save you freight.

CELERY PLANTS, strong and stocky, \$1.00 per 1000, \$9.00 per 10,000; satisfaction and safe arrival guaranteed; special low express rates. The most practical and complete book on celery culture. 75c. Peter J. Schuur, Kalamazoo, Mich.

CELERY PLANTS, Transplanted only. First-class, leading kinds. Greatly superior to seed-bed plants. Carefully packed; good for two weeks' transit. 40c. per 100, \$3.00 per 1000. R. M. Wells, Towanda, Pa.

## Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion; payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

SITUATION as gardener's assistant. Scotch-American, age 21, thoroughly familiar with work of gentleman's place. Assistant Gardener, care American Gardening.

## WANTED

A copy of Sayer's book on the Dahlia (Boston 1899). Address,

Editor AMERICAN GARDENING, P. O. Box 1697, New York.

## Questions Answered.

This is a Bureau of Information, to which subscribers can apply freely for advice on any and all subjects in the field of horticulture.

In order to lessen labor, and that the Editor and his friends may understand each other, the following rules must be observed:

### Rules for Correspondents.

Questions must be concise, plainly written on one side of the paper only, and addressed INQUIRY DEPARTMENT, AMERICAN GARDENING, P. O. Box 1697, New York City.

Letters appertaining to subscriptions, or other business matters, should be directed separately; otherwise delay may follow.

The name and address of the sender is required, in addition to a nom de plume. Use a separate sheet of paper, not a scrap, for each question. Questions will be attended to without delay. If by mistake a query fails to be answered, it should be repeated.

Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.

Questions relating to insects or diseased plants should always be accompanied by specimens, packed in a tin box, and forwarded at letter postage. Always send a liberal sample.

Conditions and soils vary so infinitely that we would be pleased to have our correspondents describe theirs.

Correspondents referring to articles which have appeared in AMERICAN GARDENING should mention page and date of issue.

• We cannot promise to comply with requests to answer by mail.

• We cannot undertake to reply by mail.

### Crimson Rose Rambler.

I have a fine plant in full blossom. It has made three very strong shoots. Should I cut off the old wood down to the ground when it has flowered or leave all the old wood till next year?—A SUBSCRIBER.

The best thing to do with the Crimson Rambler is to allow it to make all the growth it will and not to restrict it in any way. Later on the stronger wood can be tied in, and if so wished early next spring a little thinning may be done if the growths are too much crowded.

### Propagating Clematis

Kindly tell me how an amateur can best propagate the different varieties of Clematis?—W. L. D.

Amateur cannot do better than follow the professional grower; there are four ways of propagation as follows:

Grafting.—One of the oldest methods of propagating clematis is by grafting on seedlings of Clematis vitalba, viticella, virginiana and flammula. In one year these are ready for working upon. Parts of roots, about two inches long, of C. viticella and C. flammula can also be used. Many varieties are shy growers. These are cultivated quicker and are the better for it, when root grafting is adopted. This is a very simple operation when done in heat. Any strong growing kind answers the purpose, but the four mentioned are especially well adapted. A quick method is to have a sunken bench or case, with a good bottom heat, yet free from the hot pipes. The root stocks can be placed quite thickly together, and need not be planted. Insert the cion of the kind required into the fleshy part, or what should be the base of stem or above ground growth; even smaller parts of healthy roots will do. All that has to be done is to lightly whip the two parts together with matting or raffia; no wax or similar material is necessary, unless, by preference, a little moss be used afterwards. But when all the roots are so served and placed closely together, they must all be covered with moss, this taking the place of soil. Keep moderately moist and give a bottom heat of 70 degrees and top heat of 65 to 75 degrees. Pot up when the graft begins to grow. This work can be going on all winter.

Cuttings.—Bring one or two-year-old stock plants into a greenhouse in the fall, and begin by giving a temperature

of 50 to 55 degrees, in January and February 60 to 65 degrees. The young shoots should be cut in March and given good shade for the first eight days. Further treatment should be similar to that given roses. In three weeks the cuttings will be rooted. They should then be planted in pots, not too large—about 2 to 2½ inches—and slowly inured to air.

**Layers.**—These are treated like layers of wistaria. Every twelve inches make a small cut to help make roots, and with small hooks tighten the layers in the ground. A five-foot shoot should make about three to four layers. This work can be undertaken when the first wood from outside is ripe in July or August. In October cut the layers in parts and plant in pots or frames over winter.

**Seeds.**—The seed will ripen in fall. It should be gathered over winter and mixed with sandy earth, and kept in a house or frame until life is seen, and then sown. Only persons who have the knowledge and time should raise seedlings.

#### Experiment Station Bulletins.

Please tell me how I can obtain bulletins of the different experiment stations? I often see the mention of one that I would like to have, but I do not know how to obtain it.—M. F. JAGGER.

The bulletins of your own State station can always be had for the asking. If you send in an application to the director he will see that your name is put upon the list to receive gratis the various bulletins as they are issued. As a resident of the State and being interested in horticulture, you are entitled to have them sent. As regards the bulletins of the stations of other States, you have no claim upon them, but a polite request to the director of the station concerned will always bring the desired result if sufficient copies be on hand after the State demands have been supplied.

#### Greenhouse Heating With Water.

Inclose a rough drawing of a ground plan of greenhouse to be built this summer. The west house is a rose house, 38x22½ feet; a partition cuts off five feet from the main house on the north side; temperature in both main and small house is to be the same. The centre house is a palm house, 25½x25½.

This house must be kept the warmest. The east house is a carnation house, 38x22½ feet, with a partition as in rose or west house. We have two boilers that will be placed under the palm house near the west wall of rose house and about in the centre, south and north, and the chimney is near the east end of the rose house. We have from the old greenhouse some pipes (¾ inch), which we wish to use for the new houses, as well as the two hot-water boilers.

(1) How would you place the pipes to give the best satisfaction?

(2) Can I run the pipes in such a way as to regulate temperature with valves in each house? or could I if I should want no, or very little, heat, in one house, have such valves as to regulate the hot water in the pipes, and where would you place the valves to shut off in the one house if I should want less heat, and turn on to the other if I should want more heat there?—INQUIRER.

The best arrangements to be adopted are: (1) For the carnation house use five four-inch pipes, arranged in two coils, one flow and one return being along the north side and one flow and two returns on the south. In the narrow room along the north side of this house run two pipes, of which one is a flow and the other a return. In the rose house arrange the pipes in the same way, except that there should be six in the rose house (or seven, unless the smoke flue, which, according to the plan, must pass through it, will furnish some heat), and three in the narrow propagating house. To carry the water to and from these houses single four-inch flows and returns will answer. No data is furnished as to the height of the palm house or the amount of glass in the side walls, so that I cannot give a definite answer; but it will be safe to reckon a foot of pipe for every two and one-half feet in the glass area. As the pipes to the rose and carnation houses must pass through this house they should be considered.

(2) It will be very easy to regulate the heat in the different houses or to shut it off altogether by placing a valve on each flow pipe that carries the water to the different houses if these pipes run up hill; or on the returns if the circulation is down hill throughout.—L. R. TAFT.

#### Chrysanthemums Flowering Now.

I had a lot of Chrysanthemums blooming a while ago. Do you think it pays to have such early flowers—two crops?—J. LOEHR.

It is not unusual for Chrysanthemums to flower from old stools in the spring and early summer months. Some varieties are especially prone to do this, Mrs. Charles Davis, for example; but the blooms are worthless from the fact that they appear at a time when there is so much else, and further, it prevents the getting of good, healthy free stock, so that the so-called gain of the two crops would be an actual loss when the quality of the fall or seasonable flowers is considered.

#### Buds on Chrysanthemums.

I have some hardy chrysanthemums which are showing buds. Will it be necessary to pinch them off in order to have fall flowers?—R. C. S.

Do not pinch away the flower buds now in sight; they will not develop until September or October.

#### Red Spider on Roses.

How can I destroy red spider on roses? Is nicotine harmless on roses, if syringed on to destroy green fly?—J. T., Brooklyn.

Syringe heavily and often until the spider is cleared off. Water is the pet aversion of red spider. Nicotine is too expensive and dangerous to use in a crude state by syringing, neither is it so effective as when vaporized. Without the means of making it give off vapor it would be better to use stems or tobacco dust.

#### Propagating Wisteria.

(To D. W. S.)—Bring down a young branch and "layer" it; secure it to the earth by means of a peg and cover the part with soil. Or take some half-ripened points and dibble them in sand in a cool spot and keep moist.

#### Hare's-Foot Fern.

(To D. W. S.)—Almost any one of our regular advertisers of plants could supply this plant.

#### Late Cauliflower Sowing.

(To J. L.)—You will find the necessary information by referring to page 471 of last issue.

## A YARD OF ROSES.

Copyright, 1896, by O. D. Gray, New York.

The illustration but faintly represents the beauty of this celebrated painting by the well-known artist, Mr. Newton A. Wells. The grouping and coloring has been performed with exquisite taste, and the reproduction we offer is worthy a frame, and a position on the wall of any one's room. This sketch, in eleven colors, is 36 inches long and ten inches wide, on heavy drawing paper, and sells in the art stores of New York for fifty cents. We will send "A Yard of Roses," securely packed in a tube to prevent injury, postpaid, as follows:

To all renewing their subscription and adding five cents to pay postage and packing.

To all sending us \$1.00 for their own renewal subscription and 75 cents for the subscription of a friend, we will send "A Yard of Roses" free and postpaid, as a premium to both addresses.

AMERICAN GARDENING, P. O. Box 1697, New York.

### Appointments and Doings.

*Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.*

Thomas Hunt died suddenly at Poughkeepsie, N. Y., on June 27. He formerly lived in Norwich, Conn., and was for many years gardener for the late Lorenzo Blackstone.

J. E. Lager, the Orchid collector (of Lager & Hurrell) has returned from his extended trip in the Orchid regions of Central America; he arrived on July 2.

### Hartford, Conn.

On June 16 the annual rose show of the Connecticut Horticultural Society was held. Roses and strawberries were the features and some excellent vegetables were staged.

Among the chief prize-winners were: Roses—Mrs. J. R. Moore and Gustav Minge. Strawberries—Gustav Minge, W. B. May and R. Patchet. Other winners were A. Williams, E. Brown, Mrs. G. W. Moore, C. P. Lincoln, Major Case and N. F. Peck.

### Boston, Mass.

The exhibition of the Massachusetts Horticultural Society, held Saturday, June 26, brought out a show of roses that rivalled the annual rose exhibition of the week previous. Displays of roses were made by Joseph S. Fay, W. N. Craig, James Comley, J. Eaton, Jr., Kenneth Finlayson and Mrs. E. M. Gill, Messrs. Fay and Finlayson securing the prizes. The exhibits of delphiniums were very good; John L. Gardener being first, Kenneth Finlayson second. N. T. Kidder was first for display of herbaceous plants, J. W. Manning, second; Rea Bros., third. For vases of flowers, Mrs. E. M. Gill was first, Hattie B. Winter, second. E. S. Converse received a gratuity for six plants of *Begonia erecta multiflora*.

### Lenox, Mass.

The horticultural society held its regular meeting on Saturday, July 3, some thirty members being present. This was the night set apart for the exhibition of roses, vegetables, strawberries, etc., and the result was a grand display. All the available space was taken up by the exhibits; and, indeed, some few flowers were not staged for lack of room.

The judges, Mr. J. White and Mr. T. Connors, of Pittsfield, recommended the following awards: For roses—First premium to Mr. J. F. Huss; second to Mr. G. H. Thompson; third to Mr. F. H. Butler. For sweet peas—First premium to Mr. R. A. Schmidt; second, Mr. C. R. Russell. For sweet williams—First premium to Mr. F. Butler; second to Mr. E. J. Norman.

Certificates of merit were awarded to Mr. J. F. Huss for a fine exhibit of *Campanula persicifolia* and to Mr. E. J. Norman for some extra fine Sharpless strawberries.

Mr. C. R. Russell had two fine benches of Black Hamburg grapes (diploma). Honorable mention was made of Mr. Schmidt's display of *Gloxinias* and *Begonias*; also for cherries and *Coreopsis* display by Mr. E. J. Norman.

Vegetables were not a large exhibit, but the quality compensated for the lack of quantity. Mr. G. H. Thompson was first and Mr. F. H. Butler second. The latter had some excellent potatoes.

Mr. James Paul was the essayist of the evening, his subject being the cultivation of grapes under glass, which he handled in a very capable manner.

### A Gardeners' Excursion.

On Wednesday, June 30, a party of gardeners visited the 100 acres of nursery and seed grounds of J. L. Childs,

at Floral Park, N. Y. The day proved to be an admirable one for such a visit and the fields of Japanese Iris (which formed the chief centre of attraction), were just at their best. To many, if not all, of the visitors, it was a revelation that a popularly supposed sub-aquatic plant, one for which usually elaborate provision is made as regards water supply, should here be flourishing on the sun-burnt, unwatered flats of Long Island. True, the surface is not so very many feet above water, yet the fact is amply proved that this Iris, like the *Gladiolus* (of which acre upon acre was seen), can be grown to perfection in the open under ordinary field culture, weeds being kept under by means of horse cultivator.

A few of the best Irises seen were: Gold-Bound, white, early; Mahogany purple, late (it was just coming into flower); Victor, pale blue, closely lined on white, medium; Pyramid, mauve purple, very charming effect; Blue Jay, pale blue and white, late; Prince Camille de Rohan, deep purple blue, the best of the darks seen; Eugenie is an exquisite flower, white, flushed lightly with pale mauve on the flags, standard of white, with deep mauve potted edge; Exquisite is blue-grey, mottled effect, with standard of purple; Souvenir is mauve and grows only moderately high.

But enough of Irises, though they cover acres. A host of hardly herbaceous plants was inspected, including a choice collection of lilies of the best forms, a representative planting of ornamental flowering shrubs, and a large patch of the Wineberry, which is undoubtedly a handsome shrub, and deserves a place as such, even though the fruit be not greatly valued. Nearby was the *Souche* white raspberry—of the foreign type—very brisk and sweet.

Mr. Miller, the superintendent, conducted the party through the greenhouses, etc., and over the miscellaneous collection of herbaceous plants, which cannot be listed here.

*Rudbeckia Golden Glow* was seen in quantity; it is claimed to be a spontaneous double form found in Illinois and known locally as Wild Dahila.

Among those present were J. Holloway, W. Anderson and G. B. Winslade, New York; A. Welsing, L. G. Forbes, A. Herrington, P. Reilly, J. Withers, Dr. F. M. Hexamer and L. Barron.

### Concerning Carnations.

Will some of the many gardeners who read *American Gardening* be kind enough to supply a brother gardener with a list of the most profitable carnations to grow in a private establishment, having no regard to commercial purposes? Such a list coming from experienced men will at the same time assist a great many others as well as the enquirer.

**Rational Forestry Wanted.**—It is evident that our virgin coniferous supplies of timber must share the same fate which the buffalo has experienced, unless a practical application of rational forestry methods and a more economical use of supplies is inaugurated. Since coniferous wood represents two-thirds to three-fourths of our entire lumber wood consumption, and its reproduction requires more care and longer time than that of hard woods, the urgency of changing methods in its use and treatment will be apparent.—*American Cultivator*.

**Sunflower Oil.**—Dr. Wiley, the chemist of the Agricultural Department in Washington, says that in his opinion the coming salad oil will be made of sunflower seed. It is a perfect substitute for olive oil, and will be so cheap that it may be used on the poor man's table. His remark, says the *American Cultivator*, was probably meant to encourage farmers in raising sunflower seed, but it is likely to work the other way. Farmers prefer to raise something that will be dear and not cheap.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Jubilee Carnation.

Young plants of this, as received from the dealer, show heavier foliage, and apparently better thrift than any others yet tried. The blossom, as shown in the exhibitions, seems almost without fault, and is of a remarkably glowing color. Eastern growers, however, shrug their shoulders a trifle over it, intimating that for market purposes it isn't equal to Scott. But what red carnation is? Why need everything be considered below the mark because not equal to Scott? Is any other carnation of any color as yet known equal to this marvelous money-maker? Let amateurs try Jubilee, notwithstanding the shrugs, some of which may be a trifle envious after all. Its wonderful color is a strong enough point, even had it not many other good ones.

#### Buying Orchids in Summer.

Our own experience has all been in the direction of this, common sense and actual trial both pronouncing it good. Last week the question as to the best season was put to a large dealer and grower, than whom none knows orchids better. "Yes," he said, "buy them in the summer and turn them out under the apple trees; you cannot do better, for here they get the abundance of fresh air and moisture which they crave, and the partial shade which satisfies most of them. Try *Cypripedium Lawrenceanum*. It is a fine thing and very easy to grow. *C. Sedeni* is also fine, and the colors are bright for a *Cypripedium*, being mainly white and rose-pink. It is a strong grower and good every way. *C. Dominianum* is another good one, in yellow, rose and green. There are three to five flowers on a stem, and the odd petals are about eight inches long. It attracts attention. These things aren't so difficult as people think. If you can grow a palm well you can succeed with these."

#### Bouquets for Window and Porch.

If the window garden proper is not prodigal with flowers, its effect from the street may be very much enhanced by the addition of one or two bouquets, either in jardiniere or vase. The big jardiniere, filled with cut flowers, is a little foreign to the average person's idea of a bouquet, but it is certainly "a bunch of flowers," and it has come to stay. On the piazza, near the head of the steps, it is especially effective. And if one is within reach of the country it may be kept filled from season to season with weeds so beautiful as to call forth never-ending admiration. Within the house, too, the rooms may always be made pleasanter and more beautiful by some such addition, on floor or mantel, or delightfully disposed of among the plants in the bay.

#### Newer Abutilons.

The beautiful pink Abutilon, *Infanta Eulalie*, was but the forerunner of a type of short-jointed, sturdy and free-blooming pot Abutilons. The delightful pink of *Infanta Eulalie* has been supplemented by a canary yellow and a blackish crimson. The yellow is named after President McKinley. The dark crimson sort is known as *African*, which seems to be a favorite French style of expressing the fact that the flower it names is very dark-colored indeed.

#### Close Quarters for Fowls.

The question as to how many fowls can be kept in a certain space is one that has continued to recur ever since poultry keeping became important and a matter of study. The general affirmation among experts is that 25 fowls will do better than 50 in the same space; 15 will do better than 25; 10 better than 15, and so on, perhaps to infinity. The fact as it stands is not

disputed, but another question hinges upon the first; namely, how small may be the flocks housed, without increasing too much the interest on investment, cost of labor and so on? Perhaps the best-known raiser of utility poultry in the East places the profitable number at 50, which is at least double what most writers advocate. Twelve to fifteen seems to be the right number, on paper, but we believe the man who makes a business of poultry keeping usually finds 25 suit all circumstances better, though the average number of eggs may not be so high.

#### Egg Markets.

On many moderate-sized places the eggs for hatching take much of the surplus, during the earlier portion of the cheap season. But just after the hatching the surplusage becomes marked, while the price is still at the lowest, and likely to remain there for some weeks. It is then that the suburban or country dweller becomes disgusted with grocery prices and looks for a new outlet for his products. With all due respect to the force of circumstances, it must be said that this is not a favorable time to look for markets. For one thing, grocery eggs change hands more quickly than and are at their best. Customers are not so irritated by poor eggs, and so eager to find places to buy at first hand. One cannot make yearly contracts for these surplus eggs because the surplusage is a matter of a few weeks only. This is the season of the year to encourage the "home market." Better make the heaviest table drafts upon eggs now. Let there be plenty of custards and puddings. Let the home consumers get their fill, so that the draft on the high-priced eggs later may be less. Thus one may snap one's fingers at the grocer and his 8 or 10 or 15 cents a dozen, and that "in trade!"

#### Why Do the Chicks Die?

For three months past this question has sprinkled thickly the query pages of farm journals and poultry papers. One harassed editor declared in the bosom of his family that hereafter he would have but one reply to this question, namely, that he had never been to guessing school, and therefore couldn't tell. One laconic answer pretty likely to hit the mark at this season is "lice." Even though the care-taker be pretty sure no lice are present, even though he may have examined the chicks many times, even though he may have made several examinations, there are so many varieties of lice, and they hatch so fast, they may still be the cause of the trouble. Large head lice have a habit of ensconcing themselves at the bend of the chick's neck, just below the ears, where they are seldom noticed. One or two lice may seem a small matter. The loss of one chick may seem a small matter also, and the one small matter may be the due effect of the other.

#### The Use of Jardinières.

The jardiniere (from the French, and pronounced zhar din e air) is coming into universal use despite its expensive character. It was once an ornamental stand for plants and flowers, used as a piece of furniture. In its most common form it is now a large-sized pottery vase, or bowl of varying shapes, generally decorated in relief, and somewhat highly colored. The home that is without a number of these misses an important addition to its attractiveness, but they are usually sold at a price which seems far out of keeping with the actual cost of manufacture. The greatest mistakes in their use usually lie in the selection of colors. If they are to carry merely a potted plant with green foliage, the fancy of the buyer may be more or less considered; but if for flowers of brilliant hue, color harmony is the first thing to be thought of and dull greens with more blue than yellow in their tones are usually the best choice.

#### Pandanus Veitchii.

The value of this *Pandanus* as a decorative plant, by itself, or as an addition to a window collection, is not fully realized by the average buyer. Its fine green and creamy white give it a very bright effect when kept perfectly clean. It is rigid and sturdy; it has the strap leaf, which always helps to give variety, and the gashed or spiny edges of the leaves add to the pleasant variation. It is a plant to consider seriously, even though the choice must be limited to one alone.

#### Doubling Up.

This is a very familiar term and it is well understood that, when applied to the sitters, it insists that they shall have been at work for equal periods of time. It should be noted that it is no less important that broods to be "doubled up," whether with hen or brooder, should be of the same age. Even three days' advantage in age makes a difference that will be felt as long as the chicks are kept together. The older ones rob the others of their chance by trampling on them, taking an undue share of food, etc. It is sometimes an advantage, however, to place two or three older chicks with a brooder full of young things. They will serve almost as mothers, at least to be copied. Chicks learn by watching others very largely.

#### Brooder and Hen-raised Chicks.

Two suburban women, next-door neighbors, are, this season, having a competitive exhibit of their own on the respective merits of natural and artificial mothers for chicks. One is raising about 100 chicks with hens and feeding cracked corn almost exclusively. With free range the chicks thrive admirably on this unvaried diet, the abundance of green food balancing the heavy grain ration. The brooder woman finds that she cannot use corn with impunity, as her chicks are not of free range. More variation in diet and much grit are found necessary. The race is about even, so far, the brooder chicks showing about the same proportion of loss as those reared with hens. The brooder woman proudly counts 15 chicks, but objects strongly to broods larger than 40 each.

#### Madam Sailer.

This variegated-leaved edging *Geranium*, though an introduction of ten years ago, or more, is not so often seen as its merits warrant. Its peculiar tuft-like branching habit permits it to form broad, compact, rounded cushions in a short time, and if set closely a fine border soon results. If plants are then too close alternate ones may be removed, as each plant will cover a space which its delicate appearance would, at first, seem to prove impossible. For window-boxes, too, it is very good. Indoors, throughout the winter season, we have not known it to do so well; but where it succeeds it is always most useful and satisfactory.

MYRA V. NORRIS.

### Beware of Ointments for Catarrh that Contain Mercury,

as mercury will surely destroy the sense of smell and completely derange the whole system when entering it through the mucous surfaces. Such articles should never be used except on prescriptions from reputable physicians, as the damage they will do is ten fold to the good you can possibly derive from them. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, O., contains no mercury, and is taken internally, acting directly upon the blood and mucous surfaces of the system. In buying Hall's Catarrh Cure be sure you get the genuine. It is taken internally and is made in Toledo, Ohio, by F. J. Cheney & Co. Testimonials free.

Sold by Druggists, price 75c. per bottle.

WHOLESALE MARKETS.

New York.

Business for the week ending with Saturday was very good, so far as cleaning up the market is concerned; stock of early all kinds sold out and clean stores were the result, but prices ruled low, unless for exceptional quality. Arrivals for Sunday trade met with but slight demand and for Monday still worse; Tuesday to the market crowded with goods, but buyers, outside of peddlers, were few and shy, while the first-named cleared the market all that was possible and paid only what they liked for their purchases, which in many instances was ridiculously small; but at the same time much of the stock offered was of poor quality.

Hothouse grapes are abundant and selling cheap. Prices obtainable range from 5c. to 10c. per pound.

Nectarines are selling at 1c. per dozen. Tomatoes, when of good quality, are worth 10c. per pound.

Hothouse celery from Maryland is on the market, but is hardly up to the quality of last season; good, large stock makes 1.50 per dozen.

Strawberries are nearly over and sales drag over what is left.

Raspberries, if large and sound, are worth 10c., but many are inferior and sell for 3c. per quart.

Gooseberries are a drug and a number of shipments offered fail to find purchasers at any price.

Apples—North Carolina, green, per barrel, 75c. to 80c.; prime, per crate, 75c. to 80c.; common, per crate, 40c. to 50c.

Strawberries—Western N. Y., extra, Atlantic, per quart, 12c. to 13c.; common to good, quart, 4c. to 5c.; up-river, poor to good, 4c. to 5c.

Raspberries—Up-river, red, per pint, 4c. to 5c.; per three-to-four quart cup, 3c. to 4c.; four-to-four quart cup, 2c. to 3c.; upper Jersey, red, per pint, 3c. to 4c.; lower Jersey, red, per pint, 3c. to 4c.; Maryland, red, per pint, 3c. to 4c.; blackcap, up-river, fancy, per pint, 4c. to 5c.; Jersey, per pint, 2c. to 3c.; Maryland, per pint, 2c. to 3c.

Gooseberries—Large, per quart, 4c. to 5c.; small to medium, green, per quart, 2c. to 3c.

Huckleberries—Pennsylvania, blue, per quart, 10c. to 11c.; North Carolina, per quart, 6c. to 8c.; Maryland, blue, per quart, 6c. to 8c.; crackers, per quart, 6c. to 7c.; Jersey, per quart, 6c. to 7c.

Blackberries—Maryland, Lucretia, per quart, 8c. to 10c.; cultivated, per quart, 6c. to 8c.; Early Harvest, per quart, 5c. to 6c.; wild, per quart, 2c. to 3c.

Currants—Large, red, per quart, 3c. to 4c.; inferior, per quart, 2c. to 3c.; bulk stock, per pound, 2c.

Cherries—Sweet, per pound, 4c. to 5c.; sour, per pound, 4c. to 5c.; eight-pound baskets, as to size and condition, 2c. to 4c.

Pineapples—Indian River, reds, standard, crates, 24s., 25s. to 26s.; standard crates, 30s., 32s. to 34s.; standard crates, 45s., 1.50 to 1.75; other sections, per 100, 1.40 to 1.75.

Potatoes can hardly be claimed to be good property just now. The receipts for the month of June were 261,961 barrels, against 290,511 for same time last year, and prices don't go up with the decreased supply. The following quotations represent top prices; many are sold for much less: Norfolk and North Carolina Rose, fancy to prime, per barrel, 1.75 to 2.25; Eastern Shore Rose, fair to prime, per barrel, 1.75 to 2.12; Virginia and North Carolina, Pride of the South, 1.62 to 1.87; Norfolk and North Carolina, red varieties, per barrel, 1.50 to 1.75; Southern, new, No. 3 to No. 2, per barrel, 75c. to 80c.; State, per 100 pounds or sack, 75c.

Asparagus, near-by, large, per dozen, 1.25 to 1.50; ordinary, per dozen, 75c. to 80c.; inferior, 50c. to 75c.

Beets—Long Island, per 100 bunches, 1.50 to 2.00.

Corn—Jersey, per 100, 50c. to 1.25; North Carolina, per 100, 75c. to 80c.

Cabbages—Jersey and Long Island, per 100, 32c. to 35c.

Cucumbers—Norfolk, per barrel, 1.50 to 2.25; per basket, 50c. to 75c.; North Carolina, per crate, 40c. to 50c.

Cauliflowers, per barrel, 1.10 to 1.25.

Carrots—Long Island, per 100 bunches, 1.40 to 1.50.

Egg Plants—Florida, per one-half-barrel box, 1.10 to 1.25; per basket, 75c. to 80c.

Lettuce, per barrel, 50c. to 75c.

Onions—Maryland, per one-half-barrel basket, 85c. to 90c.; Eastern Shore, per one-half-barrel basket, 75c. to 85c.; Jersey, per barrel, 32.50 to 35.00; North Carolina and Virginia, per barrel, 1.75 to 2.00; Kentucky, per barrel, 1.75 to 2.00.

Peppers—South Jersey, per crate, 1.25 to 1.50.

String Beans—Long Island, per bag, 1c.; Jersey and Maryland, wax, per basket, 50c. to 75c.; Norfolk, green, one-half-barrel basket, 30c. to 50c.; wax, one-half-barrel basket, 30c. to 40c.

Squash—Southern, marrow, per barrel crate, 1.10 to 1.50; yellow, per barrel, 50c. to 60c.; white, per barrel crate, 50c. to 75c.; Long Island, white, per barrel, 1.10 to 1.25.

Tomatoes—South Jersey, per crate, 1.25 to 1.50; Maryland, per carrier, 1.50 to 2.25; Mississippi, per flat case, 70c. to 85c.; North Carolina and Virginia, per carrier, 1.10 to 1.50; Savannah, per carrier, 75c. to 1.25; Florida, prime, per carrier, 1c.; Florida, poor to fair, per carrier, 50c. to 75c.

Turnips—Russia, per barrel, 75c. to 80c.; white, per 100 bunches, 1.50.

Philadelphia.

The market has been very good here this past week. All kinds of stock have been moving freely, but prices are not high; yet, on account of the extreme warm weather dealers are glad to sell at a fair price.

The strawberry season is closing up. Only a few New York State berries are now coming in and these sell very slowly. Many crates arrive in poor condition and 9c. to 12c. per quart is the highest price noted.

Raspberries—Jersey, red, per pint, 4c. to 5c.; blackcaps, per pint, 3c. to 4c.; Maryland, per pint, 3c. to 4c.

Blackberries—Maryland and Delaware, per quart, 8c. to 10c.; Early Harvest, 6c. to 8c.

Huckleberries—Jersey, per quart, 6c. to 8c.; Maryland, per quart, 6c. to 7c.

Gooseberries—Industry, Pennsylvania-grown, 10c. to 12c.; Jersey, per quart, 6c. to 8c.

Currants, red, per quart, choice, 4c. to 5c.; fair to good, 2c. to 4c.

Pears—Florida, per barrel, 1.75 to 2.25.

Melons—Watermelons, Florida, per 100, 20c. to 25c.; fair to good, 10c. to 15c.; muskmelons, per basket, 1.10 to 1.50.

Cabbages—New Jersey, per 100, 1.75 to 2.25.

Cucumbers—Norfolk, per basket, 90c. to 1.10; Charleston, per basket, 80c. to 90c.

Egg Plants, per one-half-barrel crate, 1.80 to 2.25.

Onions—Jersey, per basket, 90c. to 1.20; New Orleans, per barrel, 2.25 to 2.75; Maryland, per one-half-barrel basket, 90c. to 1.10.

Peas—Jersey, per basket, 30c. to 50c.

String Beans—Jersey, wax, per basket, 80c. to 90c.; Norfolk, wax, one-half-barrel basket, 50c. to 60c.; green, per basket, 75c. to 90c.

Tomatoes—Jersey, per peach basket, 85c. to 1.10; Mississippi, per crate, 75c. to 90c.; Florida, per carrier, 90c. to 1.25.

Boston.

Part of the movement spoken about in our last on fruits, will this week be by decay, and the little money that was made by some of the fruit handlers will be lost, but the larger loss will fall on the grower.

Dighton strawberries are over; a few home-grown, but the larger part coming from New York State. Few days ago the average prices were big; to-day they will not much more than pay the expenses. The hot wave nearly consumed them. There are no high figures to name and as a range we are forced to say from 8c. down to 1c., so bad was the general condition.

Currants plentier and lower; price, 5c. to 8c. a quart; red raspberries, 3c. to 5c. for thirds; blackcaps or black raspberries no sale in this market; Delaware blackberries, good demand, 1c. to 1.3c.

No peaches here, therefore no quotations.

Lighter demand for Russet apples at 3c. to 3.50; new apples, mostly from Virginia, 50c. to 1.10 half-barrel basket.

Hothouse cucumbers have caught the decline and move slowly at a cent and a half apiece.

Summer squash, 50c. to 75c. a dozen.

Long Island beans, 1.10 to 1.25 half-barrel bag; some native beans here this morning; wax, 1.50 a bushel; green, 1.25.

Long Island cabbage about 1c.

Choice watermelons, 25c. to 35c. This weather makes them taste good and they relieve the thirst.

Kalamazoo celery is in light demand; if sold brings 40c. to 50c. a bunch.

Asparagus but little wanted even at 50c. a dozen.

Native beets, 1c. to 2c. a bunch; turnips, 3c. to 5c. a bunch.

Spinach takes a range of 30c. to 50c. a bushel; parsley steady at 1.25 a bushel.

Best Virginia white potatoes, 2.50 a barrel, with fine red stock 2c. Quite a good deal of that quality which goes in between selling at 2.12 to 2.25.

Mushrooms, 75c. a pound.

Black Hamburg grapes lighter demand, 50c. to 75c. a pound.

Guess the sick people are getting well!

Egg Plants so little called for that it hardly needs to be quoted. If asked for sell fairly well.

Cauliflowers, 1.50 to 2.25 a barrel.

Some peppers appearing, no one knows where they come from, but somewhere near home, bring 1c. a bushel.

Peas, 40c. to 50c. a bushel, the lowest prices ever recorded at Fourth of July time. The day before the Fourth they sold 30c. to 40c., as against 2.50 to 2.75 last year.

Lettuce market demoralized; old beets and turnips all gone; few old carrots still needed for the soups.

Fair demand for some choice old potatoes at prices ranging anywhere 40c. to 50c. a bushel.

No pears or plums on the market, excepting California stock. The trade is quite well pleased, however, to see some of the California late Valencias, because they are fine, demand good prices and seem to please; 112 counts, 3.25; 128 counts, 3.75; 176 counts, 4c.

The commission men say the late holiday time has been about the hardest three days to do business in, handling fruits, that this city ever saw. Of course a reaction will occur, but at this writing they are feeling pretty tired and have not done much to satisfy either the buyer or the seller.

Red Bananas.—It is reported that the supply of these, which is chiefly from Cuba, has ceased on account of the war in that island. The Boston Fruit Company reports that it usually receives two steamers a week, carrying each 20,000 bunches. Banana plantations have been destroyed like other food supplies.

BLINDNESS PREVENTED

The Absorption Treatment a Success. Hundreds successfully treated for all diseases of the eyes or lids without knife or risk at their homes and at our Sanitarium, the largest and most successful institution in America. Offer No. 80.

FOR ONE NEW SUBSCRIPTION

200 CELERY PLANTS

AS FOLLOWS:

- 50 Plants White Plume.
- 50 Plants New Rose.
- 50 Plants Golden Self-Blanching.
- 50 Plants Giant Pascal.

This offer is from a first-class, reliable grower, and will be mailed, postpaid, for one new subscription to AMERICAN GARDENING. Orders for celery plants will be filled from now until August 15th.

AMERICAN GARDENING, P. O. Box 1697, N. Y.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is a reflection and an index of our subscribers' interest in us.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call for the desired assistance. Understanding thoroughly the value of the paper to every one interested in Gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER PREMIUMS

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us **AT LEAST** one new subscriber before the close of Summer.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only **seven new subscriptions at \$1.00 each.**

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. *Handsomely illustrated, cloth, 12mo. \$2.00.*

*Given for 5 new subscriptions at \$1.00 each.*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases,

dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo. cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Grape Growers' Manual.** (The Bushberg). An exhaustive work on the cultivation of the grape, with accounts of diseases, insects, etc., by specialists. The descriptive list of varieties is specially useful and complete; the typographical method of designating importance of varieties is a feature. Pp., 200. Royal 8vo. Illustrated. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Greenhouse Construction.** By PROF. L. R. TAPP. A complete treatise on Greenhouse structures and arrangements of the various forms and styles of Plant Houses for professional florists as well as amateurs. All the best and most approved structures are so fully and clearly described that anyone who desires to build a greenhouse will have no difficulty in determining the kind best suited to his purpose. The modern and most successful methods of heating and ventilating are fully treated upon. Special chapters are devoted to houses used for the growing of one kind of plants exclusively. The construction of hotbeds and frames receive appropriate attention. Over one hundred excellent illustrations, specially engraved for this work, make every point clear to the reader and add considerably to the artistic appearance of the book. Cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**How to Grow Cut Flowers.** By M. A. HUNT. A thoroughly practical treatise on the cultivation of the Rose and other flowering plants for cut flowers. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**How to Know the Wild Flowers.** By MRS. WILLIAM STARR DANA. A guide to the names, haunts, and habits of our common wild flowers. The most handy and easy reference book for amateurs. With 100 illustrations by Marion Satterlee. 12mo. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Henderson's Handbook of Plants and General Horticulture.** By PETER HENDERSON. This has long been acknowledged as the standard American work on general horticulture, giving history, geographical distribution and cultural directions for all cultivated fruits and flowers. Illustrated. Cloth, 8vo. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Insects Injurious to Fruit.** By PROF. WM. SAUNDERS. A work of great value to all fruit growers, written by a man of science as well as a practical agriculturist, and the result of careful and minute observations and experience. It treats, under separate chapters, of the injurious insects which prey upon our fruit trees, vines and bushes, together with their mode of operation, and contains careful directions as to the best means of destroying them. With over 400 pages, 440 illustrations. 12 mo. Cloth. \$2.00.

*Given for 5 new subscriptions at \$2.00 each.*

**Johnson's Gardener's Dictionary.** This is a new and revised edition, greatly enlarged, of "Johnson's Cottage Gardener's Dictionary," first published in 1846; containing a full and reliable list of every plant in cultivation, names printed in bold type, rendering reference easy. An important feature of the work is the placing of synonyms alongside the correct name, instead of in a separate list. The habitat of each variety is given along with the date of its introduction. The cultural directions are brief and to the point. Insect foes, diseases and their remedies are fully described, and figures of some of the former have been given. Handsomely bound in one volume. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Landscape Gardening or How to Lay out a Garden.** By EDWARD KEMP. Intended as a guide in choosing, forming or improving an estate (from a quarter of an acre to a hundred acres in extent), with reference to both design and execution, with numerous fine wood engravings. Cloth, 12mo. \$2.50.

*Given for 6 new subscriptions at \$1.00 each.*

**Parsons on the Rose.** By SAMUEL B. PARSONS. New and revised. A treatise on the propagation, culture, and history of the Rose. Illustrated. \$1.00.

*Given for 3 new subscriptions at \$1.00 each.*

**Practical Floriculture.** By PETER HENDERSON. A guide to the successful propagation and cultivation of Florists' Plants. As in every work from this gifted author's pen nothing has been left unsaid that bears on the subject. Illustrated. Cloth, 12mo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Profits in Poultry.** Useful and ornamental breeds and their profitable management. This excellent work contains the combined experience of a number of practical men in all departments of poultry raising. It is profusely illustrated and forms a unique and important addition to our poultry literature. Cloth, 12mo. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Strawberry Culturist.** By A. S. FULLER. Containing the history, sexuality, field and garden culture of strawberries, forcing or pot culture, etc., fully illustrated. Flexible cloth, 12mo. 25 cts.

*Given for 1 new subscription at \$1.00 each.*

**Success in Market Gardening.** By W. W. RAWSON. Illustrated. This work is written by one of the most successful market gardeners in New England, who gives here the results of his life-long experience in the growing of vegetables out-of-doors and under glass, with special adaptation to the climate of New England. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Shrubs of Northeastern America.** By CHAS. S. NEWHALL, author of "The Trees of Northeastern America," etc. This volume is beautifully printed on beautiful paper, and has a list of 116 illustrations calculated to explain the text. It has a mine of precious information, such as is seldom gathered within the covers of such a volume. Illustrated, 8vo. \$2.50.

*Given for 5 new subscriptions at \$1.00 each.*

**The Rose.** By H. B. ELLWANGER. Revised edition. A treatise on the cultivation, history, family characteristics, etc., of the various groups of roses, with names and accurate descriptions of the varieties now generally grown, brought down to 1892. This work contains full directions for planting, pruning, propagating, and treating of diseases, and insect pests, and is particularly valuable for its classification and full alphabetical lists of one thousand and eighty-six varieties. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**The Treasury of Botany.** Edited by LINDLEY and MOORE. This is a popular Dictionary of the Vegetable Kingdom, with which is incorporated a glossary of botanical terms. Twenty steel plates and numerous wood cuts. Two parts, Fop-8vo., 1372 pp. \$3.50.

*Given for 10 new subscriptions at \$1.00 each.*

**The Small Fruit Culturist and Nursery Directory.** By A. S. FULLER. This is the first work devoted exclusively to small fruits, and completely covers the ground of propagating, culture, varieties, preparing for market, etc. Thoroughly illustrated, cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**The Art of Propagation.** By J. JENKINS. A concise, practical treatise on the rapid multiplication of vines, plants, trees, etc., detailing the management in propagation of seeds, bulbs, cuttings, etc., and the manner of operating in grafting, budding, inarching, etc. Ample illustrated. 30 cents.

*Given for 1 new subscription at \$1.00 each.*

**Tomato Culture.** By J. W. DAY, D. CUMMINGS, and A. I. ROOT. In three parts. A valuable treatise, embracing field culture, forcing under glass, and raising plants for market. Of value to any one growing garden truck of any kind aside from tomatoes. 150 pages. Illustrated. Paper. 40 cents.

*Given for 1 new subscription at \$1.00 each.*

**The Nursery Book.** By PROF. L. H. BAILEY. This is a complete handbook of propagation of plants treating on seedage, separation and division, layerage, cuttage, graftage, including grafting, budding, inarching, etc. It tells plainly and briefly what everyone who sows a seed, makes a cutting, sets a graft, or wants to know. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Amateur Orchid Cultivators' Guide Book.** By H. A. BURBERRY, F. R. H. S., orchid grower to the Right Hon. Jos. Chamberlain, M. P. Tells how to grow Orchids, in cool, intermediate, or warm houses, successfully. There is a calendar of operations for each month, and full information as to the treatment required by all orchids mentioned in the book. Just published. New edition, colored plates. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Trees of the Northern United States.** (Their Study, Description and Determination). By Prof. AUSTIN C. AGAR. This handbook is to the trees of its locality what Gray's well-known Manual of Botany is to the other plants. It furnishes a complete key to the wild and cultivated trees found east of the Rocky Mountains and north of the southern boundary of Virginia and Missouri. Preceding the key are chapters discussing the essential organs of trees and terms needed for their description, and the plans and models for tree description. The book is profusely illustrated, handsomely bound, and will be sent to any address on receipt of price. Nearly 500 illustrations, cloth, 12mo. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**The Dictionary of Gardening.** A Practical Encyclopedia of Horticulture. By GEORGE NICHOLSON, A. L. S., assisted by some of the most eminent writers in the botanical and horticultural world. The Dictionary of Gardening is the most complete work of the kind ever published; the practical information and botanical classification have been brought down to the latest date, and nothing has been neglected to make it in all respects the standard work on horticulture in all its branches, from the growing of the hardiest plants to the cultivation of the most delicate exotics. It is the recognized authority of the Society of American Florists on nomenclature of plants. Illustrated, with more than 2370 first-class engravings with numerous colored plates of exquisite finish and life-like exactness. 4 vols., cloth, large, 8vo. Prepaid, per volume, \$5.00; complete, \$20.00.

*Given for 40 new subscriptions at \$1.00 each.*

**Vegetables, How to Grow them.** By E. WATTS. 40 cents.

*Given for 1 new subscription at \$1.00 each.*

**Vines and Vine Culture.** (Considered the best book on Grapes). By ARCHIBALD F. BARRON, ex-superintendent of Royal Horticultural Society's Garden, Chiswick; Secretary of the Fruit Committee. Demy 8vo., handsomely bound in cloth. 3d edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Wild Flowers in Art and Nature.** By J. C. L. SPARKES, Principal of the National Art Training School, South Kensington, and F. W. BURBIDGE, Curator of the University Botanical Gardens, Dublin. With 21 full-page colored plates, by H. G. Moon. Handsomely bound, gilt edges. \$4.

*Given for 7 new subscriptions at \$1.00 each.*

### No Expense For Threshing.

There is a simple little machine on the market, which can be had for \$1.— with farm right to use it. This tool was named "dial," but if it is called "hurricane," the work will be easier. The farmer's time is nothing, and after threshing is finished, he can buy a little "pocket whirligig" and build fence. Of course the progressive farmer will not try to compete with steam, either in threshing or fence building. He uses the **PAGE**.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present growing popularity of the Water Garden is largely due, is designed to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The book will be freely illustrated with plates and illustrations in the text, and will describe all operations, from the growing of plants in tubs to construction of the large pond, planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

## The Parks of Hartford, Conn.

Nearly one year ago AMERICAN GARDENING had occasion to call attention to the public parks of this city, and then remarked on its good fortune in already having possession of 400 acres upon which improvements were being carried out and that the people were able to use the entire acre for recreation.

markable address illustrates plainly the sentiment which actuated the public men of the city of Hartford; the late Hon. Charles M. Pond donated and willed to the people forever a tract of land, covering 90 acres, to be known as Pond Park. This magnificent gift was closely followed by Col. Pope (of bicycle fame), who has given the city 73 acres. The city has also acquired 75

FIG. 139.—BUSHNELL PARK, HARTFORD, CONN.

The illustrations which we present on this occasion show views on the oldest and most advanced of this series of park lands which will eventually completely encircle the city, affording to the residents nearly 1500 acres of breathing space.

These figures show a remarkable increase of area since 1894; in November of that year, Mayor Leverett Brainard, recently showed that the population of the city was over 60,000 and that the park area only represented 60 acres. This gentleman's re-

acres on the river banks and which is unofficially known as Riverside Park. There is also the South End Park, of 150 acres, and as a grand climax when completed will be the Keney Park of 1000 acres, also made possible by the munificence of a deceased townsman, Mr. Henry Keney.

One noticeable and pleasing feature of this elaborate system is that the whole design is to make the parks in every shape and form "Peoples Parks," at the same time all possible skill

and taste are being brought to bear upon them to make them not one whit behind the show parks of other cities. In order to attain this result the best talent obtainable is at work upon them. A public man of the highest type of honor and usefulness is at the head of the Board of Commissioners in the person of the Rev. Francis Goodwin, and with the other commissioners is ably seconded by the direct work of Mr. Theodore Wirth, who is superintendent of the city parks. Guiding and planning the newer Keeney Park is Mr. G. A. Parker, Mr. Goodwin here again acting as president of the Board of Trustees, as this space is not to become city property until it is a complete park in all details of planting, grading and road making.

## Notes From the Herbaceous Garden.

Delphiniums are among the most beautiful of hardy flowers and for the past two weeks *D. formosum* has been a most conspicuous feature in our borders. The leaves are large, palmate in outline and deeply lobed, while the lovely soft, blue flowers are arranged in terminal and sub-terminal panicles. It is a native of Siberia.

*D. crassifolium* has branching stems and thick leaves, as its specific name indicates, the flowers are of a dull purple color. It is also a native of Siberia.

*D. nudicaule* is a pretty species from California. It grows only about one foot high with small palmate leaves and racemes of bright scarlet flowers. It has proved perfectly hardy with us during the past two winters.

*D. grandiflorum album* grows about eighteen inches in height and the leaves are very much lobed. The flowers are larger than, but not nearly so freely produced as in most other species. It is a native of Siberia.

*D. Uechtritzi* is flowering here for the first time. The foliage and habit closely resemble the well-known *D. Ajacis*, and I suspect it is only a variety of that species. The flowers are of a peculiar purplish color and rather attractive. It grows about three feet high.

*Aconitum Napellus* is closely related to and closely resembles the Delphiniums. It is a good subject for the hardy border. The flowers are purple, the upper sepal forming a hood over the whole flower, hence the common name of Monkshood.

*Thalictrum Fendleri*, a Western species of meadow rue, is a most attractive plant and well worth a place in the hardy plant border. It grows to about four feet in height and has large, compound leaves and terminal panicles of bright yellow flowers, which are slightly fragrant.

In the Pink Family *Silene armeria* is just now a blaze of beauty. It grows about two feet in height and produces its corymbs of deep pink flowers in the greatest profusion. It is an annual and reproduces itself from self-sown seed. Very often plants which self-sow themselves so freely are inclined to be "weedy," but this plant is certainly an exception. It is a native of France and Switzerland and is known by the common name of "Sweet William Catchfly."

*S. Pennsylvanica* is another pretty annual. It is of bushy habit, growing only one foot in height. The lovely pink flowers are about one inch in diameter and freely produced.

*S. Virginica*, the "Fire Pink," is perhaps too well known to need description, but it is one of the most lovely of our native plants and should be in every garden.

*S. viscaria splendens* resembles the foregoing in habit, but the flowers are of a bright pink color, produced in terminal clusters, which rise well above the foliage. It is one of the very best species.

*S. alpina* is a pretty white-flowered species with linear leaves of a glaucous green color. It is a good subject for the

rock garden, where we have it growing.

*S. pendula*, a native of Southern Europe, while by no means the slowest species, has a very graceful habit and demands notice. The flowers are of a greenish yellow color and are produced on large panicles.

*S. maritima* and *S. stylosa* are grown here for botanical purposes. They are not nearly as attractive as the preceding, being of straggling habit, leaves of a sea-green color, small, white flowers and large, inflated calyxes.

No collection of hardy flowers is complete without one or more species of Campanula. According to Index Kewensis (the standard authority on nomenclature) there are 298 species; of this host a few are natives of this country while the majority are found in the region of the Mediterranean and in China and Japan. Although their range of color is not great, mostly blue and white, they are among the most attractive of garden flowers, the family containing few if any "poor relations." They are easily propagated from seed and grow well in any good garden soil, providing they have a sunny position. They are mostly perennials or biennials; very rarely annuals. Our collection here at present is not large, not more than eight or ten species, but the collection contains some of the very best.

*Campanula persicifolia*, the peach-leaved Campanula, we consider to be one of the best. The leaves are sessile, some six inches in length. The branching flower stalks are some two and one-half feet in height; the flowers are large, blue and white in color, and freely produced. It is fine for cutting purposes and its home is Europe and Northern Asia.

*C. fragilis* is also a beautiful species. It is perennial, of dwarf, bushy habit, while the white, soft lavender and blue flowers stand erect above the foliage, the individual flowers measuring some one and a half inches in diameter.

*C. carpathica* is similar in habit to the preceding, but the flowers are pure white and somewhat smaller. Both these two species are native of Southern Europe, but have proved quite hardy with us without protection.

*C. glomerata* is one of the best and one of the best-known species. The funnel-shaped blue flowers are produced in terminal and axillary clusters. It is a native of Europe and Central Asia.

*C. garganica*, a pretty little diminutive species from Italy and Greece, has been flowering in the rock-garden here for the past two weeks, where it is a most suitable subject. The racemes of sky-blue flowers are very attractive.

*C. medium*, the popular "Canterbury Bell," is perhaps too well known to need description. It is a biennial and produces very freely its large cup and saucer-shaped flowers. It is often grown in pots for cool greenhouse decoration and makes a most attractive pot plant.

*Platycodon grandiflorum Mariesii*, or as it is also called *Campanula grandiflora*, is among the finest of the whole genus. It is perennial, of somewhat stiff or erect habit, and produces freely its large blue and white flowers, which often measure three inches in diameter. Its home is the country where we get so many other good plants from—Japan.

EDWARD J. CANNING,  
Botanic Garden, Smith College, Northampton, Mass.

## Big Lice These!

Fruit trees in the neighborhood of Sioux City, Iowa, are literally overwhelmed with plant lice, says the Omaha Bee, and proceeding to give emphasis, remarks:

"In some instances the twigs and branches are so laden with the lice that they are so bent under the weight that it has been found necessary to place props under the limbs to keep them from being torn from the trees."

These lice must be very heavy.

## Some Plant Notes.

The season thus far has been a really remarkable one—as a whole, very beneficial to herbaceous perennials, but bad for roses, the tender shoots being almost killed by the 8 or 10 degrees of frost about the 20th of April. *Rosa Wichuriana*, which had sprouted well, was killed back for a yard or more. Owing to the almost frosty June and the too abundant rains, Dahlias rotted in the ground where the soil was heavy, and tender bedding plants made no growth whatever, and this condition of affairs has not been improved by the three weeks' absence of rain with torrid heat.

**Sweet Pea Cupid.**—The promises held out in the spring catalogues regarding this dwarf pea seem again not to be justified. The same defects still exist—the small percentage of seeds germinating; the ugly, sprawling habit of the plant, and the very short flower stem. One may well ask of what use is a sweet pea that makes no show in the garden, and is of no value for cutting. The Pink Cupid, of which a few seeds were disseminated among a favored few, has all the faults of its progenitor.

**Salvia Patens.**—This is probably the most beautiful of all the *Salvias*. Its intense blue is only equaled by that of *Gentiana acaulis*. It does not make the brilliant showing in the garden that the common *splendens* does, but notwithstanding its sparser bloom, a mass would no doubt excite more admiration on account of the unusually beautiful color. If mulched deeply it would probably survive the winter, as *S. Pitcheri*, another handsome blue variety, has proved hardy under like conditions. Another blue member of the family, *S. pratensis*, hardly deserves the catalogue encomiums. It is coarse and weedy and the color is too dark to be effective in garden work. The one called "Golden-leaved *Salvia*," an introduction of this season, has not bloomed as yet. While the foliage is pleasing light green, it cannot by any means be called golden. A dozen plants are making satisfactory growth, and would seem that the exposure given them—they get only the morning sun—would be the proper one to bring out the coloring.

**Spiraea Anthony Waterer.**—This recent introduction is a neat shrub, with pretty foliage, in many instances variegated with white. The claims, of some high floricultural authorities that it is destined to replace the *ranium* as a bedding plant, or to make an equally successful show bed, is never, in the opinion of the writer, verified. On first coming into bloom the trusses are large and of a charming shade of red or deep pink. These fade very quickly, leaving the color a dingy pink, very unattractive. The plant will continue to bloom during the summer if the faded trusses are kept constantly cut off, but the successive clusters are small and in no way equal to the first June bloom. This has been the experience of the writer, but perhaps others may have something more encouraging to report.

**Coleus.**—Some of the recent introductions of Burpee in this line, especially the so-called copper-colored *Coleus*, are exceedingly handsome and entirely novel. They would be doing even much better in a less dry season.—L. C. L. JORDAN.

**Inferior Wood Ashes.**—Fred W. Morse, of the New Hampshire Experiment Station, states that the average Canada ashes contain about 12 per cent. of moisture, which renders them as damp as the average chemical fertilizer. Buyers of ashes should, therefore, look with suspicion on lots that appear excessively moist, because in such cases the potash is seldom equal to the proportion in average ashes. Ashes from paper are valueless, because the soluble mineral matter has been leached out of the paper stock during the process of paper making.

## A Rose Garden.

I have sent you to-day some prints showing a section of the rose garden here that I made in 1893, where was originally a farm barnyard. The circle of roses is some twelve feet below the level of a carriage drive about 300 feet to the south, the general level on the west being nine feet, falling away towards the north, so that here it is two feet below the centre circle. This is 125 feet in diameter and contains about

No. 2, Charles Lawson, Coupe d'Hebe, Periere, Paul's Carmine and the Ramblers.

To the northeast a large bed is filled with a mixed crowd and a gay spot they make it all summer. Here are Polyantha hybrids and Hermosa, La France, Agrippina, American Beauty, Augusta Victoria, Meteor, Perle and such like.

The Prairie roses, with some of their strong-growing sisters, as rugosa, Benet's seedling and Dundee Rambler,

are planted out. I have endeavored to give some idea of their appearance by the aid of a kodak, but the photographer (myself) is not an expert. I also enclosed a print showing the west side of the bank mentioned, showing a portion of *Rosa rugosa*, var. *Comte d'Epresmesnil*.—J. HOLLOWAY, L. I., N. Y.

—The photographs to which our correspondent refers shows that he has a rose garden worthy of the name. Mr. Holloway's method of using polyantha, rugosa and such like sections for bold effect is one which could well be followed by many of our readers. What has been done in this old barnyard in a year or two can be equally well done in others.

## The Vegetable Garden.

**Garden Work.**—The work of the garden is never ended, as many imagine. There is always plenty to do for those who seek it and are interested in their work. The principal thing to do now is to keep the crops picked clean, and as soon as they are over to clear them away, carefully raking up and carting off all rubbish. At all times there may be found bits of stick, stones, paper, wire, tin cans, etc., to mar the appearance of the grounds; these are frequently carried there in the manure and should always be picked up and not thrown under the currant bushes or into some corners in the garden, as such cannot be hidden from the quick eye of the employer, and should be taken clean away.

**Weeds.**—Don't allow any docks, dandelions or plantains to go to seed. It is well to remember the old adage of "one year's seeding makes nine years' weeding," which I remember many years ago in one well-kept place in England, where I once worked, was painted in bold letters and hung up in a prominent position in one of the garden buildings, where every workman could see it daily.

**All tools** should be taken to their proper places before the work of the day is over, and not be allowed to lay around everywhere to rust and get lost. A suitable building should always be provided where all tools can be conveniently kept when not in use and there can always be found when needed without loss of time.

**Keep on file** all numbers of this journal for future reference, as many hints are constantly given that possibly may not appear again. And as we are not all endowed with a phenomenal memory enabling us to retain all points, and recall them just at the required moment, one glance at the notes at times would frequently save much inconvenience.

**Take your notes now**, as you find them. They will be useful to refer to another year. Note which varieties of the different vegetables have given the best satisfaction this year. The Juno pea is a new variety to us, and here it has proved to be remarkably productive, of good color and fine taste, and takes very little time to pick a basket of it. We intend to grow many more of this next season.

W. M. EDWARDS, Conn.

**Tree Case in Court.**—A tree agent in Baltimore sold a bill of goods to a party for \$77. After the goods had been received and paid for by check the party discovered that he had been humbugged and stopped payment of the check. The tree agent brought suit to recover. In the testimony it was proven that a Cape Myrtle was sold and a Ground Myrtle sent, at the cost of \$1.50. The stock otherwise was said to be overcharged and misrepresented. Expert testimony was heard for both sides, but the jury brought in a verdict granting the plaintiff \$30, he paying the costs. This amount had been offered by the purchaser before the case went on trial, but was refused.

FIG. 140.—MEMORIAL ARCH, HARTFORD, CONN., MEETING HALL OF CONN., POMOLOGICAL SOCIETY IN THE BACKGROUND. (See page 501.)

800 plants of hybrid perpetuals in seventy-five varieties.

On the bank to the west is a collection of single-flowered sorts, among them multiflora, polyantha, grandiflora, Paul's single, lucida, etc., and including six varieties of *Rosa rugosa* (rubra, alba, Zuccariniana, Comte d'Epresmesnil, Madame Georges Bruant and Mrs. Charles Worth).

The Afghan yellow rose, *Ecæ*, is more of a curiosity than a beauty. Nearby are a dozen varieties of moss roses.

To the southeast are a number of pillar roses, including Mrs. Paul, Blairli

Glory of Cheshunt, Madame Isaac have less trim quarters given them where they can follow their own sweet will, while setigera and Wichuriana are doing their best at covering boulders, and for near-by companions at the same business have Grandiflora, Macartney simplex, with double-white and single-pink Brambles and Virginia creeper.

Perhaps before I tire you I had better switch off to the Hydrangeas grouped near. These hortensis, Otaska, ramulus coccineus, Thomas Hogg, Japonica and a variety styled Newport

### Among the Strawberries.

The notes following are designed to point out some of the good and bad qualities of a few of the varieties grown here this season:

**Beeder Wood.**—Of good color and uniform size; a good variety to plant with Crescent or Warfield's No. 2. Foliage much affected with rust.

**Bixler's Seedling.**—A large, showy berry; sells for the highest price in market. Is a shy bearer, similar in productiveness to Sharpless.

**Brandywine.**—Desirable; holds its fruit up well from the ground; of large size; sells well; not of the highest quality.

**Bubach.**—For the past few years this berry has brought the highest price on the market here (with the exception of Michel's Early) on account of its large size and beautiful appearance. The foliage is healthy and of a deep green color; a strong grower. For it to do its best it should be grown in narrow rows and heavily mulched between the rows. It is not the best shipper, although it can be shipped short distances and arrive in good condition. This season it has been more productive than usual. Many like the flavor, but others dislike it, especially if it be "dead ripe" when used.

**Clyde** is promising, but has not been fully tested by us as yet.

**Cumberland.**—This is a perfect blossomed variety, which is worthy a place in every home garden; of beautiful color, much above medium in size.

**Crescent.**—Many growers still hold to the Crescent, as it can always be depended upon to bear plenty of berries even if most other varieties fail, and if not allowed to grow too thick together is of fair size. I have grown it in hills twelve to fifteen inches apart in the row and rows three feet apart, and it is astonishing what a crop can be raised from it thus treated. Its chief fault is in growing too much to runners, but that is no objection to the person who will keep the runners cut off—rather in its favor.

**Enhance.**—A good pollinizer for pistillate sorts, like Haverland; large size and good variety for canning, as it shows up well with its dark wine-colored juice. A fair shipper. Roots deeply in the soil, thus enabling it to carry out and mature a large crop of berries. With me it has ripened all the berries that it set. The color is against it in a market where a light-colored berry like Crescent or Haverland is preferred. One great fault is its not having plenty of foliage to cover the berries from the heat of the sun.

**Gandy.**—This is bringing in most money at present writing (June 30) on account of lateness and being of large size, while the last pickings of most other varieties are small; not as productive as would be desired.

**Greenville.**—Not too highly pleased with this.

**Haverland.**—This berry was in the largest demand from our wagon this season, many customers preferring it for table use. It is of good size, its color is attractive and it can be grown very large in narrow rows and hills; should be heavily mulched, as weight of fruit bends the slender fruit stem to the ground; very productive; does well on poor soil; too soft for shipping far; will not keep in good shape much over a day and night.

**Marshall.**—Strong grower; berry large; quality all right. Its chief fault is rusting of the foliage during the latter part of the growing season.

**Michel's Early** has given most excellent satisfaction. Its value seems to increase with age. Patches three years old bore a good crop. It was our earliest berry and came in for the best price; stems part readily from the hull; one of our best fertilizers, not as productive as many other varieties, but this year it has been more productive

than usual; does best on sandy soils. We shall not discard it for some time to come, although in the latter part of the season the rust affects the foliage badly.

**Princess** seems to be much larger and finer in every way than at any time in the past.

**Parker Earle.**—A first-class late variety; good, perfect blossomed sort to plant with late pistillates; grows but few runners; does not ripen all the berries to a fair size at last pickings; quality good; does best grown in hills; will mature more of its berries on clay or heavy loam than on sandy soil.

**Ridgeway.**—Judging from spring-set plants this is quite promising. I invested quite largely in the variety and see no reason to regret it. The quality is very fine; flesh meaty, without any tough core; an excellent table berry. I think it will be a good shipper, but cannot say for certain as yet. The foliage seems to be all right and the plant is one of the most vigorous growers on our place; is a perfect flowering variety, with occasionally a pistillate

**Wilson.**—As a fruiting berry I prefer the Warfield to the Wilson, but the latter is now, as it always has been, a first-class sort for producing pollen. It is much affected with rust where grown on soil of too dry a nature.  
CHARLES C. NASH, St. Joseph Co. Mich.

### The Fruit Garden.

This has been so far the most trying of seasons as regards cleaning among fruit trees. I do not remember ever before doing so much spraying and getting so little apparent satisfaction from it.

**Fire Blight.**—To lovers of fruit trees this is a direful disease, in a few days destroying the labor of years. It may be vigorously fought. The mistake often made is to only cut out the dead parts, whereas every scrap cut off should have attached to it a liberal piece of healthy wood.

**Pears.**—See that the early kinds are as Beurre, Giffard, Manning's Elm

blossom, but does not give enough of the latter to keep it from being a good variety to set with pistillate sorts; shall plant largely of it next spring.

**Sharpless.**—Some very large berries were grown from this variety. It is one of the berries to grow when some very large samples are wanted. A shy bearer; blossoms often; injured by spring frosts; healthy plant and strong grower.

**Timbrell** is of good quality and size; makes a good table berry, but is of too blotchy an appearance to take well in market.

**Warfield** is one of our best shipping berries; used more for canning in this section than any other one variety. To obtain the largest fruits it should be grown in hills or narrow rows on rich soil; generally does best on heavy loam. At least every third row should be of a good fertilizing sort to keep Warfield from growing too much to buttons toward the last pickings, which also often run small; rather tart for regular table use, unless very ripe. The plants of this variety should not be allowed to take root any closer than four to six inches apart.

beth, etc., do not hang too long before being picked.

**Apples.**—A fairly good early one for a very small place is Tetofsky, one of the Russian kinds, it being a compact grower; tree five or six feet in height; quite showy, with fruit of medium size; yellow, striped red.

**Cherries.**—Belle Magnifique is a moderate grower. The fruit is one of the very best late kinds for cooking and for the table when fully ripe; season, middle of July. Napoleon Bigarreau is a good solid yellow fruit slightly shaded with red in the sun; season, first to middle of July; tree strong grower.

**Strawberries.**—The continuance of dry weather will make the planting of new beds late this year. Old plants of the early kinds are making few runners. This can be changed somewhat if water and labor can be had—two essentials rarely plentiful in gardens.

J. HOLLOWAY, L. I.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

### Market Measures.

Will you please make your market report a little more explicit? I am at loss to know what is meant at plums per basket and peaches per carrier, etc. -OHIO.

—The question is a very natural and proper one to make, but unfortunately is a rather difficult one to comply with, owing to the immense amount of space which would be required week by week if size and details of packages are given in detail.

Generally in the New York market packages are uniform in size and certainly should be, but there are still a few sections and some shippers which have somehow adopted sizes of their own and have thus failed to fall in line with the great mass of their competitors.

The packages referred to in our market reports, viz.: plums and peaches in "baskets" and "carriers," are staple regular measures. The plums are

slats, the last-named is far the best, for the space between the slats allows some sunshine to enter and also provides for a free circulation of air, which is to the plants' advantage. If neither of these arrangements are possible fix open all doors and open all ventilators, shading the glass with white lead and naphtha.

### Quinces Dropping.

Enclosed with this are some quinces which have dropped from my bushes. Will you please inform me (through paper) what the trouble is and how to prevent. The bushes have been sprayed with Bordeaux mixture three times and once for lice with kerosene emulsion (one to twenty); third spraying, Bordeaux mixture had Paris green mixed with a new formula.—FREDERIC A. WOODRUFF.

—The dropping of the fruit of your tree is due to the plant not having sufficient vigor to enable it to carry the

### Chrysanthemums.

**Watering.**—The hot spell necessitates a good deal of attention with the hose, and plants must be closely looked after, particularly the pot plants, for if they get dry a few times the shoots get tough and wiry and the plant will, in gardening phraseology, get "stuck" and a serious check will result. If pot plants are inside the conditions of moisture can be more easily attended to, but plants that are outside, if they are fully exposed to the sun, would be greatly benefited if a piece of canvas shading could be fixed to spread over them at mid-day. The last week's heat is for July a scorcher on a down grade, without a brake attachment, and not a thought of back pedaling. The sun is certainly out to make his century run.

FIG. 142.—THE PARKS OF HARTFORD, CONN., SHOWING THE CAPITOL (See page 501)

packed lightly and weigh about four pounds each basket. It is a fairly safe rule to look upon a carrier as being about equal to a standard bushel in measurement, and as regards length it is made to accommodate eight baskets and is probably two inches longer than a regular bushel pear or tomato box.

### Planting Violets.

Is it safe to plant violets in their permanent quarters where they are to grow? If so, will you kindly give a few hints how to proceed and oblige, A GARDENER.

—It is becoming the rule among commercial violet growers to plant their bushes early and this season such has been specially noticeable; we have already this season seen probably forty bushes planted and others we have heard of have already been planted. Some growers have taken the sash off the houses and covered with cheese cloth, while others have covered with

full set. It is not due to a disease nor to any insect attack. Excess of wood may be the cause in your case, but of course we can only suggest.

#### Plants Named.

(To C. M.)—*Syringa japonica*. (Sender's name lost; native elm accompanied.) *Celtis occidentalis*.

**The true beauty of an evergreen** lies in a vigorous, luxuriant growth, and yet not such as consists of only a few strong branches here and there, but a thick and full growth, strong and bushy—fat, as we may say—not a huge skeleton, remarkable only for its large bones, but well filled with firm flesh of a healthy hue. To get this and yet not interfere with the tree's vigor is the aim and object of evergreen pruning.—Thomas Meehan.

There is a great showing of fruit in certain sections of Long Island. Apples, pears and peaches are very abundant, especially in the neighborhood of Glen Cove and Seacliff.

**Mulching.**—Where the bench plants have made a good start they should now be mulched with tobacco stems. This will keep the roots cool and keep black and green fly at a respectful distance. It also has value as a fertilizing agent in addition. Examine the bed on a hot day where it is mulched and where the soil is bare and the difference in the temperature will speak for itself.

**The army worm** is putting in an appearance. Later on, if not caught now, this becomes probably the most destructive of all his fellows. He will bore right through a bud and sever every petal. His aspirations should, therefore, be "nipped in the bud," and before, if you can find him, and he generally leaves abundant evidence around, eating, as he does, from the ground up.

**Specimen plants** will need lots of attention now, tying and getting into shape. Give them all the care they need. They will repay you later on.

C. TOTTY, N. J.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 13, 1894.

PUBLISHED BY

ROSE AND DUANE STS.,

RHINELANDER BUILDING, NEW YORK.

Telephone, 3154 Cortlandt.

P. O. Box 1897.

REGISTERED CABLE ADDRESS

Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\*\*\* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

## History of the Sweet Pea.

In our next issue will be published the first part of the result of an exhaustive review of the history and development of this now most popular flower, together with references to and illustrations from historical works.

**Sycamore Blight** MANY complaints have been received this or Anthracnose. season of a serious disease of the sycamore. In affected trees, the leaves turn brown and dry up, and the young twigs in many cases die. The disease is caused by a fungus (*Gloeosporium nervisequum*) closely related to the one which occurs on the grape, causing what is known as anthracnose. The fungus very commonly attacks the large veins of the leaves and in this way cuts off the supply of water and nourishment. As a result half of a leaf or frequently a whole leaf will wilt, then turn brown, and die. Trees badly affected have a ragged, thin appearance, in striking contrast to the usual vigorous, full-leaved, healthy specimens.

The disease is widely disseminated, occurring not only in Europe, but all through the eastern, southern, and western portions of this country. In Washington and elsewhere the oriental sycamore and also our native species suffer. It seems to be worse, however, on our native tree. From the character of the trees and the nature of the disease it is doubtful if any benefit would result from the use of fungicides. It is probable that by a judicious use of the pruning shears the disease might in a measure be held in check. All the young branches of affected trees should be shortened in and the trimmings burned. Possibly by following this treatment for two or three seasons, pruning early in the spring, the disease could be largely eliminated. The evidence strongly indicates that a tree once attacked becomes more and more affected each year, and this furnishes additional weight to the importance of destroying the parts containing the fungus.—B. T. GALLOWAY.

**The Lungs of the City.** SEVERAL things combine at this moment to cause us to ask: "What are parks for?" The answer will no doubt very much depend upon circumstances almost as varying as the location of the tracts of park lands concerned. If the question be put to the average man or woman, the reply will be that a park is designed as a lung for an over-populated area, a breathing space for the toilers of the city, and as a recreation ground for the little ones. Our own feelings are heartily in accord with the sentiment thus expressed, and it is sad, indeed, to see the Board of Commissioners (always composed of men of comparative wealth) sometimes wasting its energies in squabbles on the "artistic" fancies of their own imagining. Art certainly has a place in a park, but it should be that art which is so subtle as not to be glaringly paraded to the complete occultation of the more utilitarian aspect of city park lands.

Every facility should be given to attract the youth of a city to the parks. Instead of asking how little can be done, the question should be: How better can we attract them?

It is, in the present social condition, the height of folly to provide the park as a fashionable carriage drive and riding ground for "Society." In New York City such a tendency as regards Central Park has long been apparent. If a pedestrian happen to set foot on a roadway, except at a specified crossing, he is liable to arrest. How much better they manage these affairs elsewhere. In the city of Hartford, Conn., to whose system of park lands we refer elsewhere, is seen a nobility of aspiration which reflects credit upon its residents. Example is a great factor for good, and would that other cities had such a public spirited man to lead them as Mayor Brainard. We quote from his message a few sentences which we should like to see put up in large letters in all the city halls of this land.

"Pure air, pleasant surroundings, and a change of scenery are acknowledged and important factors in the promotion of health and good order among the denizens of cities; and for these reasons many families are accustomed to leave their city homes in summer time for a period of rest and recreation at the seashore, the mountains, or elsewhere. Unfortunately, the

circumstances of a large proportion of city residents do not admit of such change. Many are compelled to live in small tenements, not always well ventilated, nor healthfully located. It is not enough that the people of one section of the city should be enabled to occupy and enjoy healthy and beautiful surroundings; but it is clearly the duty of those in authority to provide, if possible, pleasant and salutary grounds near to the neglected portions, which shall be open and accessible to everyone, and by their sanitary influence tend to prevent disease which might originate and jeopardize the health and lives of all our citizens. "It is for the benefit of those who cannot seek recreation elsewhere that public spirited and more fortunate citizens in most cities favor the acquisition of outlying lands to be used as public parks or pleasure grounds and places of resort."

As to the unique position of New York, it is to be noted as a fact for consideration that some of the daily press regretted the issuing of a recent order throwing open the lawns to the children during the hot weather. As a matter of fact, these lawns never ought to have been closed; they are held by the representatives of the people for the people, then in all fairness, let the public have the use of its own.

## To the Fruit Growers of Eastern New York.

At a meeting of the Eastern New York Horticultural Society, held in Poughkeepsie last March, a committee was appointed to look after plant diseases. The work of the committee consists in making observations on the amount of damage done by various diseases of fruits in Eastern New York and on the effect of spraying or other treatment for these diseases.

In order that the report of the committee may be as complete as possible, fruit growers are earnestly requested to notify the committee of any unusual outbreak of fruit diseases. Any information will be gladly received.

Correspondence may be addressed to any of the committee, as follows: F. C. Stewart, Jamaica, N. Y.; P. W. King, Athens, N. Y.; F. A. Taber, Poughkeepsie, N. Y.; L. E. Covert, Clintondale, N. Y.; E. W. Barnes, Middle Hope, N. Y.

## The Value of a Reputation.

A gentleman from a neighboring city, while purchasing some strawberries of a dealer in Pittsfield, said to the dealer: "Those are fine berries. I can occasionally get as nice at home, but am not always sure of them." The dealer replied that he had not received a crate of soft or dirty fruit from that grower for ten years, and he could guarantee just such the season through. Thereupon the gentleman ordered six boxes sent him by express three times a week for the whole season.

Passing through the Boston market I noticed some neatly-put-up fruit at one of the best stands in the New Faneuil Hall Market. I said to the dealer: "There must be money in that fruit for you." He smiled and replied: "Well, it is fine fruit and nicely put up. I always give it the preference, for I can depend upon it. If the grower telegraphs a shipment made I sometimes sell it all before it reaches me. There is not so very much money in it for me, but I like to see it front of my store. I consider it an honor to any man in Boston to handle those goods."—Massachusetts Ploughman.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send sc. stamp for our new catalogue.

## Strawberries.

### Mr. Dwyer upholds summer planting.

Your issue of July 10 at hand and I have carefully read Mr. Hale's comment on my recent address on strawberries at the American Institute, New York City. I am always pleased to have Mr. Hale or any one else join issue with me on anything I have to say on horticultural matters. Good, fair, honest discussions are valuable and often a great deal of knowledge is obtained in this way; however, I will always insist on being fought fairly. Mr. Hale either did not read my address as printed in your paper or else he did not get the correct meaning from it. In no part of that address is there any reference whatever to the number of plants required to plant an acre of land.

I have never, either by advice or in my articles, recommended any one to plant 20,000 plants to the acre. It is absurd for Mr. Hale to take such a meaning from my remarks and in so doing he (no doubt unintentionally) places me in a false position. "Let us have the truth if the heavens fall."

I advised setting these pot-grown plants eighteen inches apart in the row and four feet apart between the rows. To set an acre of plants these distances apart would require about 7,500 plants, not 20,000 plants, as stated by Mr. Hale. You see there is a great exaggeration to start with. We did put the price of pot-grown plants at 2½ cents each and of course were thinking of retail prices. As a matter of fact, most any producer of pot-grown plants will furnish them in lots of 3,000 and upwards at \$13 per 1,000.

Now these are all facts. Instead of an acre set with pot-grown plants costing, at Mr. Hale's figure, \$500, they really would cost less than \$100, and then Mr. Hale's estimate of \$18 to \$25 for 20,000 layer plants in the spring is entirely too low. Good plants cannot be profitably grown, dug and packed for this money, and I presume Mr. Hale knows this, for his catalogue prices run (about the same as do those of other reliable dealers) from \$2.50 to \$4 per 1,000 for the standard varieties.

I did say, and I repeat it, that every pot-grown plant set in July or August would produce this season eight or ten young plants, and that each of these plants would produce one-half pint of fruit each next season. In other words, they will form the proper width of matted row for fruiting next season for profitable results. If Mr. Hale understands pot-grown plants he knows that this can be done and that when this result is not obtained it is either the fault of the land or of the grower. We have always advised planting in the spring, and still advise it; but we know from the experience of ourselves and others that, where you have already taken a crop of early vegetables from your land with conditions favorable, good market, etc., you can plant pot-grown plants at the prices I have named and will find them a profitable investment and get more money from them than from any other crop you can plant on this land.

I will have but little to say at this time about varieties. I have found the Marshall the finest berry I have ever grown. It is productive enough for us to make more money from it than any other variety we have. The Brandywine is a close second and I will keep right on planting these.

Trial beds are very uncertain, more especially so when judgment is formed from plants set in them the autumn or fall before fruiting. Many of our best varieties, like the Downing and Cumberland Triumph, make a poor showing of fruit the first season after being planted. The Marshall variety is somewhat of the same order. Like some of our friends all these improve on long acquaintance. T. J. DWYER.

Our publishers will supply any book wanted. Send your orders.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Clematis Dying Off.**—I have read with much interest H. J. Bothe's letter on this subject in your last issue. The point raised is a most important one and I am glad it is brought to your notice. A thorough investigation should be made, since I am positive there are not only hundreds of amateurs, but also florists and nurserymen who could tell the same story of failure as is related by your correspondent. It may seem somewhat queer to your readers for me to have to say that I have for a number of years met with exactly the same misfortune as did H. J. Bothe, and though I have had theories as to the causes which led to such failures and losses, I have not, as yet, been able to decide what causes Clematis, after starting into what would seem a successful growth, to all of a sudden "go back" and rarely ever amount to anything. My opinion now is that Clematis should be transplanted in the autumn instead of in the spring and I purpose to plant a number of them this autumn into permanent position. I have a very fine stock of plants, both from root divisions as well as grafted plants (our own propagation), and also imported plants. I find that the home-grown plants grafted upon our native sorts are less subjected to this unfortunate collapse than the imported ones, which are from division and grown in rich, marshy soil. I hope that all who have similar experience with Clematis and any who have found a remedy will kindly let the lovers of this beautiful plant have their experience through your columns.—H. A. SIEBRECHT.

**Aquelegias.**—I, for one, desire to thank Mr. Canning for the recent article in *American Gardening* on the Aquelegias. To me it was very interesting and would have been more so had it continued the subject farther. I have several very beautiful varieties, the spurs of which shade off to purple, lilac and a brownish shade. I do not know the names of any of them, but they are very beautiful.—JOS. M. WADE, Mass.

**Plants in My Greenhouse.**—Mr. N. Butterbach, Oceanic, N. J., is curious to know what plants I raise in the greenhouse. A complete list would occupy more space than I fancy the editor would care to allow. The 40 to 80 degrees mentioned on page 427 are extreme limits. Having no market for cut flowers, roses and such like are grown only for personal satisfaction. Red spider is unknown in my house, aphids seldom appears and I have no "damping off" to speak of, but do have the healthiest, thriftiest lot of flowers and vegetables that can be grown, even in the open ground in summer. Blistered glass will injure some tender foliaged plants without a doubt; but when a field of potatoes is injured in foliage by a light summer shower, followed by direct rays of bright sunshine, the glass cuts no figure. If Mr. Butterbach wishes some of the delusions of greenhouse work corrected and will visit or correspond with me perhaps a "Maryland Gardener" can give him points of value, having gained all my knowledge from experiments. I have no old-fashioned ideas to combat nor prejudices to overcome. My methods are intended to reduce cost to a minimum. With this I mail to the editor, under separate cover, some strawberries that are undergoing an experiment to secure "lateness." The varieties are Clyde and Crawford. They were fruited in the house in February and March and were a partial failure (in size), were reseed

and transferred to the open ground. Some are still blooming at this date, July 7. Another experiment of transplanting poppies and blooming them in the house was successfully done. Callas are had in bloom from Christmas till now. Location, form of house and peculiar potting soils have their effect, with the minor points of handling, etc.—HENRY SNYDER, Oxford, Md.

—The ripe berries were of moderate size; others, unripe, were plentiful. It is certainly late for strawberries in Maryland.—Ed.

## An Ant Destroyer.

Having heard of many remedies for divesting lawns of ants, I will add my personal experience to the number, as, possibly, it may help others. I have experimented with many things to get rid of the pests and their depredations. For a long time fortune hung in the balance. Now I can cry, Eureka!

Our lawns and walks were infested with immense colonies of ants. Their nests were enormous, honeycombing the turf, killing the grass and running four or more feet into the ground, as I found out by digging. They even swarmed over my cherished plants, showing great partiality for peonias, just as the buds were swelling. These puny antagonists, after a warfare waged against them for years, made me almost despair of victory.

I tried such well-known remedies as tobacco, hellebore, whale oil soap, kerosene, Paris green, quassia, camphor, in fact everything I could think or had ever heard of—all without success. One day, when the case seemed almost hopeless, I procured several pound cans of Carbonel Disulphidum, or, as it is generally known, Carbon Bisulphide, and made another attack on a great ant nest, which had given us much trouble. The apertures of the nest were numerous, and near one another. Seeking out every vent to their haunts, and gently pouring a spoonful or two of the compound into each opening, then covering the latter quietly with a little soil, when all were charged I applied a match to one hole, keeping my face turned away to avoid the expected fumes. Drawing back, I awaited results.

In a second or two I had before me a miniature earthquake. There were subterranean sounds of a rumbling nature, slight upheavals of the soil, puffs of smoke issuing from all the near-by openings, accompanied by the most indescribably disgusting odor. But oh, the ants! The poor ants! The maimed, the dead and dying, were thrown out and heaped about the doorsides and hatchways of their domiciles. Amidst the bodies of the slain I was cruel enough to exult over their discomfiture: for, if I had not discovered how to rid lawns of ants, at least I had found an agent that would exterminate them en masse.

Now, with a little vigilance, in blowing up or fumigating new abodes, they are so kept in check that one would hardly realize their existence. I was fearful at first that the chemical might injure neighboring plants; but they have not been in the least affected.

L. P. HILLHOUSE.

—Bisulphide of carbon is undoubtedly the best substance for the destruction of ants. It is quite unnecessary to explode it; indeed, better not. Full particulars on the use of this article were given in last week's issue.—Ed.

**Fruit for Covent Garden.**—It is estimated that on Monday, June 21, 200 tons of strawberries, 500 tons of cherries, 10 tons of apricots, 10 tons of plums, between 10 and 20 tons each of red and black currants, and 200 tons of green gooseberries arrived at Covent Garden. In addition to these 31,000 cases of oranges, about 10,000 cases of lemons, and 3,000 bunches of bananas came to hand.

## A Plea for Garden Roses.\*

(Concluded from page 492.)

And now comes the most difficult question to decide, viz.: What varieties to plant? This is where the doctors are sure to differ. There are in existence at the present time say in round numbers, two thousand five hundred varieties of roses—an embarrassment of riches. If I had the space every one of them would be planted. The real pleasure of a rose garden does not consist so much in comparing reds with whites, yellows and pinks as in studying the nice distinctions and individual characteristics. Many we learn to love for their faults. The late Mr. Peter Henderson related an amusing story in "Gardening for Pleasure" bearing upon this question, which is worth repetition: An old German florist said to him once: "I haf so mooch droobles mit de ladies ven dey comes to buy mine rose. Dey all vants him hardy; dey vants him dooble; dey vants him nice gooler; dey vants him schmell goot; dey vants him moonldy; dey vants him to be everyding in von rose. Now, I haf to say to dose ladies dat I sees not dat lady dat is rich, dat is young, dat is goot demper, dat is bootiful, dat is healdy, dat is schmart, dat is eferydings in von lady. I sees her not mooch." There is more truth than poetry in the German's petulance. And what rose lover would want all the good qualities in one rose? Not many, at all events. The variation is the charm. We would wish that the fragrance of La France was bestowed on Crimson Rambler, or that Persian Yellow was devoid of its villainous odor; but we will not part with them on that account. We may wish that the little Polyantha or Multiflora Roses were allotted a perfume equal to the teas or hybrid perpetuals; but they are, nevertheless, charming without it. Some day, perhaps, our hybridizers will give us roses with qualities now lacking in our present favorites, for which we thank them in advance. Some day, too, we may have a nomenclature committee, who will meet the French roses at the portals of our country and rechristen them with a pronounceable name before presenting them, for which we all most devoutly thank them in advance. A rose by any other name than Mademoiselle Suzanne Marie de Rodocanachi would smell just as sweet and we would not miss our train trying to tell our neighbor what it is called. It is to be hoped that the young lady changed her name and that it was a shorter one. Provision should be made in such a case for a like change in the name of the rose. The man who called a rose "Grande Duchesse Heritiere Marie Anne de Luxembourg" had no consideration for the poor gardener or florist who would have to write it on a four-inch label with a stump of a pencil. They don't write it. They simply say the rose is no good; it is relegated to obscurity and so they have their revenge. It is a pity that the French raisers cannot see the absurdity of calling roses such long names, and above all, calling them after every member of a family, resulting in unlimited confusion.

The last five years have been most prolific in new roses; in fact, almost a revolution has taken place; and the planter to-day has vastly improved material to select from. That grand rose, the Crimson Rambler, has added an entirely new feature to the garden and must be reckoned with for a complete rose garden, either trained in pillar form on an arbor, or on the house. No garden is complete without it. Following in its wake we have the Yellow Rambler (Aglala), and the dream of years is realized in it. Then we have the Pink Rambler (Euphrosyne), and the White Rambler (Thalia). It is, perhaps, too early yet to say that these latter are of ironclad hardness,

but they promise well. Another beautiful pillar rose is Carmine Pillar, unique in its magnificent shade of rosy carmine. Rosa Wichuriana has added another charming feature to the rose garden, and I do not know a more pleasing sight than to see it trained up to a post as a single specimen, or trained to form an archway. Its foliage alone will repay for the trouble, but its flowers are most charming in their grace and beauty. The double varieties of this are a great advance, equally beautiful foliage, flowers exquisitely fragrant. The Pink Roamer, one of the hybrids, has the charming color of Carmine Pillar and is a most useful rose. For covering terraces or low boundary walls, these roses are of inestimable value.

The new hybrid Sweet Briars add another feature to our garden roses.

The hybrid tea section has been wonderfully developed, particularly by J. Pernet-Ducher, who has given us Mme. Caroline Testout, Mlle. Germaine Trochon, a yellow variety like Sunset, which has proved hardy at New York; Mme. Abel Chatenay, a beautiful pink rose, and Souvenir du President Carnot. These are all fine garden roses and come very near to supplying what the German florist so vainly wished for. Belle Siebrecht must not be overlooked as a summer rose, and that grand acquisition, Kaiserin Augusta Victoria, supplies the finest white flowers it is possible to get.

For those who like novelty in roses that taste can be satisfied with Roger Lambelin, crimson and white, just like Gen. Jacqueminot, after being treated with a sulphur match as we did when boys. Then we have that wonder, the Inconstant Beauty, with its many-colored flowers, another and a lovely "freak."

In hybrid perpetuals the year is made memorable by the introduction of Jubilee, the rose that won for its raiser the gold medal of the Massachusetts Horticultural Society—peerless in its magnificent velvety crimson and pure red. And before I forget it, let me whisper in your ear that there is another American rose which is coming out soon and which will be worth having in the garden, viz.: Mrs. Robert Garrett, a hybrid tea of the largest size—long, pointed buds, a beautiful clear pink—as yet it is without a rival in sight. And so as not to create a wrong impression, let me say that it is likely to lead all the pink forcing roses, as well because of its size and magnificent color.

And what garden is complete without the Rosa Rugosa? None. A rose garden without a representative is like the play of "Hamlet" without the moody Dane. If there is room at all put in a plant of that beautiful child of the Rugosas, Mme. Georges Bruant.

Don't forget to save a corner for the moss roses, as moist and cool as you can get it. There is nothing on earth prettier than a perfect bud of the Old English, Glory of Mosses or Crested Moss, not forgetting that pale beauty, Comtesse de Murinais. It is a pity our climate is not more in accord with their

(Continued on next page.)

## Beware of Ointments for Catarrh that Contain Mercury,

as mercury will surely destroy the sense of smell and completely derange the whole system when entering it through the mucous surfaces. Such articles should never be used except on prescriptions from reputable physicians, as the damage they will do is ten fold to the good you can possibly derive from them. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, O. contains no mercury, and is taken internally, acting directly upon the blood and mucous surfaces of the system. In buying Hall's Catarrh Cure be sure you get the genuine. It is taken internally and is made in Toledo, Ohio, by F. J. Cheney & Co. Testimonials free.

Sold by Druggists, price 75c. per bottle.

## HOUSE PLANTS

AND

HOW TO SUCCEED WITH THEM.

BY

LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when noting with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to be far beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"HOUSE PLANTS" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "House Plants" will take its position second only to the much prized and ever handy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fail.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done, if my instructions are followed."

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. Those silent monitors, the flowers, are not dumb, but speak to us through the delicacy of their scents, their intricate shapes, complex habits, and the glorious pelling of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

\*Paper read by Mr. P. O'Mara, at the Annandale (N. Y.) Rose Show, June 16, 1897.

**AMERICAN GARDENING, P. O. Box 1697, New York.**

## For Present Sowing.

**TURNIP SEED.** We have all the best varieties.

**CUCUMBER SEED FOR PICKLES.** Our STOCKS are the Finest.

The first Consignment of our **SURE CROP, Mushroom Spawn**, just arrived.

Quality! **BETTER!!** than ever!!!

Descriptive Catalogue Free, by mail.

## Built to Sit On, Not to Straddle.

### THE WHEELER BIOVOLE SADDLE.

Every rider who has given the **WHEELER REFORM** a trial prefers it to all other saddles. Endorsed by physicians. Especially recommended for ladies.

We will send a Wheeler Bicycle Saddle as a Premium for Three New Subscriptions at \$1.00 each. Purchaser pays express.

AMERICAN GARDENING, P. O. Box 1697, NEW YORK

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.

J. Davies, formerly with H. McK. Twombly, Madison, N. J., has been engaged as gardener for A. R. Whitney, Esq., Morristown, N. J.

### Mount Kisco, N. Y.

The Westchester County Horticultural Society held its regular monthly meeting in the Mount Kisco Opera House on Friday night, June 25. Two new members were elected. There was a fine exhibit of roses and hardy flowers. President A. L. Marshall exhibited some fine strawberries, tomato Ignatum, and Snowball cauliflower; Mr. George Barton a collection of hardy flowers; Mr. George Carpenter a bunch of sweet peas; Mr. James Wood some fine Baroness Rothschild Roses and Sweet Peas; Mr. J. O. Miller a dish of fine gooseberries.

Mr. George Barton gave a talk on hardy plants, suitable for cottage gardens, which was very interesting, as he told about the Sweet William, hardy Phlox and its many varieties, producing flowers from early spring till late fall; the Delphinium, with its various shades of blue, and Coreopsis, with its bright golden yellow, and the many colored Rhododendrons, which can be grown in any garden.

The meetings fixed for July and August will be omitted, the next meeting coming on September 24.

### Boston.

A fine exhibition was presented at the rooms of the Massachusetts Horticultural Society on Saturday July 5. Wm. Thatcher carried off the honors on Iris Kämpferi and Campanula media. Miss M. S. Walker receiving one prize for iris, and the Bussey Institution one for campanulas. The Society's silver medal was awarded to J. E. Rothwell for *Miltonia vexillaria*, and W. E. Coburn received honorable mention for pelargonium "Dorothy." Certificate of Merit was awarded to T. C. Thurlow for *Rhus cotinus atropurpurea*, and a similar award to W. H. Cowing for *Rosa lucida* var. *alba*.

### A Burlesque?

What must be seriously intended as a burlesque schedule for a November show has lately been circulated among the several horticultural societies around New York. The demand for flowering shrubs when the land is all frost-bound is charmingly naive and so, too, is the provision of a class for the luscious peach and nectarine fruits of the summer's sun. But the compiler soars into the sublimely ridiculous in his subtle allusions to "specimen" Lageria, Epacris, Fuchsia, Mimosa, fancy Caladium and "a vine in a pot." The proposed show of Chrysanthemums is drawn on lines of grandeur indeed—fancy a close competition in a vase of 100 blooms!

But, ye gardeners, here is a chance for you to win laurels; you are asked to bring forth "bush plants grown to one stem." Many members of the craft are thankful to the shining wit for having had such a lightsome frolic offered them at this dull time.

### Roses of the Victorian Era.

The "Gardener's Chronicle," London, in its issue of June 12, publishes an interesting account of the progress made in the rose world during the reign of Queen Victoria. The writer of the article says: "During the period of the last sixty years, it is very difficult to say how many roses have been sent out into the world, but if we take the average of forty each year, there cannot have been fewer than between 2,000 and 3,000 roses sent forth by raisers abroad and at home."

"The three classes of roses whose improvement has been so remarkable during the past sixty years are hybrid perpetual tea scented, and Noisettes. The origin of the former is a matter of considerable doubt; but I believe that the hybrid Chin crossed with Damask, hybrid Bourbon and other roses, have produced some of the magnificent flowers which we now possess. Two of the most celebrated raisers in older days were Laffay and Vibert; but do not think any of their productions have survived to the present day, except in a few garden roses such as Gloire des Rosoman and Almée Vibert. The origin of the tea and Noisettes is somewhat better known; they are the product of the China rose crossed with the yellow China or Tea rose, and I believe that all the fine varieties that we possess are traceable to this combination. The Noisette rose was raised in America by M. Philippe Noisette; it was produced from Old Musk fertilized with the common China rose, and from the first has been a great favorite with French rose growers; but its earlier raisers could never have anticipated the glorious results which have followed during recent years."

"In the hybrid perpetual class there are no roses that go back to the period of H. Majesty's accession, and by far the great number of roses date back to the sixteenth and seventeenth centuries. How prolific the soil were in good roses may be seen by the following list, and which still maintain the position as exhibition roses:—Alfred Colomb, Annie Wood, Baroness Rothschild, Camille Bernardin, Charles Lefevre, Comte Raimbaud, Comtesse d'Orléans, Devienne Lamy, Dr. Andry, Duchesse de Morny, Duc de Wellington, Dupuy Jamet, Eugénie Verdier, Fisher Holmes, Horace Vernet, Louis Van Houtte, Madame Victor Verdier, Marguerite de St. Amand, Mar. Baumann, Marie Rady, Marquise de Castellane, Maurice Bernardin, Mons. Noms, Pierre Notting, Prince Camille de Rohan and Xavier Olibo.

"The seventies produced much fewer, the most noticeable among them being A. Williams and Madame Gabrielle Luitz.

"In Tea roses nearly all of the most valued varieties came from France. A the grand Teas from Niphetos sent out 1843, down to Maman Cochet in 1893, have come from abroad; some from America but they have been mainly sports.

"In garden roses also there have been charming additions in the class of Noisettes.

"Other classes of roses have, during the latter portion of this period, come to much notice: one is the class of hybrid tea and to which some good additions have latterly been made, although I quite think that the fewer the divisions, and the simpler the classification, the better; if they serve the purpose of keeping the decided tea and Noisette roses in a class themselves. It is somewhat remarkable that no attempt has been made in what is called summer roses, hybrid Chinas, hybrid Bourbons, Gallicas, etc.

"There is yet another class which has received some remarkable additions during the past few years, that ordinarily called polyantha; the Japanese rose multiflora simplex has been crossed with some of the teas, and has produced a delightful class of dwarf double polyanthas, and flowers as Cecile Brunner, Ma Paquet, Gloire de Polyanthas, Perle d'Or, and others, form a class which we cannot afford to neglect, blooming, as they do, in large clusters, and of a bright and pleasing color. To these must be added the remarkable rose, Crimson Rambler.

"To the Japanese we also owe the roses of the ferox or rugosa character, which, whether in flower or fruit are valuable, and which may probably yet give under the hands of the hybridizer, a new class; the attempt has already been made and the double-flowering one, Madame Georges Bruant, may be the avant-courier of many others."

### Died.

George W. Park, a pioneer nurseryman, died at Lansing, Mich., recently aged 65 years.

Charles Le Cluse, a nurseryman Bayport, L. I., was found dead in home recently. It is thought that he was murdered by tramps. The wife is also dead, presumably from shock.

# WHOLESALE MARKETS.

## New York.

The cut-flower business is about as poor as it can possibly be; the supply of roses, and in fact of all stock is unusually heavy for this season of the year, consequently prices are very low. Sweet peas are being sent in enormous quantities, and as a general thing do not average more than 50c. per 100 bunches; figures vary from 35c. to \$1 per 100, these quotations are only for peas of exceptional quality. It may reasonably be stated that peas never were better than they are this season.

Fruits and vegetables are being received in tremendous bulk just now, but withal are being cleared out just as fast, although there is no boom in values, and sometimes low figures are taken with the object of keeping the market cleared up.

Long Island potatoes are in splendid condition, and prices are steady at from \$2.12, with a tendency to stiffen to \$2.25.

Georgia peaches are arriving in quantities; quality fair and prices vary from \$2.50 to \$4 per crate, a fair average being \$3 for high grade fruit.

Current growers are very much disgusted with the prevailing low price realized, and many are said to be doing away with their bushes as a consequence.

Pears have done well during the past week, and this week up to time of report, continue good.

Hot-house grapes are dull, and 50c. per pound makes the average for special stock.

Hot-house tomatoes have had quite a boom for two weeks, and a few shipments of special quality have reached 20c. per pound, the average being from 10c to 15c., this has been due to the poor condition of outdoor grown of late, but will probably change very shortly when Jersey and other local crops come in.

But few mushrooms are arriving, good quality makes 75c. per pound.

Apples—Jersey, windfall, per barrel, 75c. @ \$1.25; Virginia and North Carolina, green, per barrel, \$1 @ \$2; Maryland and Delaware, good to prime, per crate, 60c. @ \$1 common, per crate, 30 @ 40c.

Strawberries—Western New York, com. to good, quart, 3 @ 8c.

Raspberries—Up-river, red, per pint, 3 @ 4c.; per 3-to-quar cup, 2 @ 24c.; 4-to-quar cup, 1 @ 2c.; Upper Jersey, red, per pint, 2 @ 34c.; Lower Jersey, red, per pint, 2 @ 3c.; Blackcap, up-river, fancy, per pint, 2 @ 34c.; Jersey, per pint, 2 @ 28c.

Gooseberries—Large, per quart, 4 @ 6c.; small to medium, green, per quart, 2 @ 4c.

Huckleberries—Shawangunk Mountains, per quart, 7 @ 8c.; Pennsylvania, blue, per quart, 7 @ 8c.; Jersey, per quart, 5 @ 7c.; Maryland per quart, 4 @ 6c.

Blackberries—South Jersey, cultivated, per quart, 4 @ 6c.; Maryland and Delaware, cultivated, per quart, 3 @ 5c.; cultivated, inferior, 2 @ 3c.; Early Harvest, per quart, 2 @ 3c.

Currents—Large, red, per quart, 3 @ 4c.; small, red, per quart, 1 1/2 @ 2 1/2c.; bulk stock, per pound, 2 @ 3c.

Cherries—Sweet, per pound, 3 @ 7c.; sour, per pound, 3 @ 6c.; eight-pound baskets, as to size and condition, 15 @ 50c.

Melons—Watermelons, by rail, per car, \$200 @ \$300; by steamer, per car, \$125 @ \$300; medium to large, per 100, \$20 @ \$30; small or inferior, 100, \$10 @ \$15. Muskmelons—Fancy, per bushel basket, \$1.50; poor to fair, per basket, 50c. @ \$1; per barrel or barrel crate, \$1 @ \$2.50.

Peaches—Southern, fancy, late, per carrier, \$2.50; late, good to choice, \$1.50 @ \$2; poor to fair, per carrier, 50c. @ \$1; Maryland and Delaware, early, per crate, 75c. @ \$1.

Pears—Le Conte, medium to fancy, per barrel, \$2.50 @ \$3.25; inferior, per barrel, \$1.75 @ \$2.25; per barrel crate, \$2 @ \$2.50.

Asparagus—Near by, large, per dozen, \$1.25 @ \$1.50; ordinary per dozen, 75c. @ \$1.

Corn—Jersey, per 100, 50 @ 75c.; North Carolina, per 100, 50 @ 75c.

Cabbages—Jersey and Long Island, per 100, \$2 @ \$3.50.

Cucumbers—Jersey, per bushel box, \$1 @ \$1.50; Philadelphia, per 1/2 barrel basket, \$1.50; Baltimore, per bushel basket, \$1 @ \$1.25; Norfolk, per barrel, \$1.50 @ \$2.25.

Egg Plants—Florida, per 1/2 barrel box, 75c. @ \$1.25; Florida, per basket, 50c. @ \$1; Jersey, per bushel box, \$1 @ \$1.25.

Onions—Maryland, per 1/2 barrel basket, 30 @ 90c.; Eastern Shore, per 1/2 barrel basket, 65 @ 75c.; North Carolina and Virginia, per barrel, \$1.75 @ \$1.87; Kentucky, per barrel, \$1.75 @ \$2; Jersey, per barrel, \$2 @ \$2.25; Orange County, red, per barrel, \$1 @ \$1.75.

Peppers—South Jersey, per crate, \$1 @ \$1.25.

Squash—Southern, marrow, per barrel

crate, 75c. @ \$1.25; yellow, per barrel, 50 @ 75c.; white, per barrel crate, 50 @ 75c.

Tomatoes—Monmouth County, Jersey, per crate, \$1.50 @ \$2; South Jersey, per crate, \$1 @ \$1.50; Maryland, per carrier, \$1.50 @ \$2.50; Norfolk, per carrier, \$1.50 @ \$2.25; Savannah, per carrier, \$1 @ \$1.50; Savannah, unwrapped, per crate, 75c. @ \$1; Florida, poor to fair, per carrier, 75c. @ \$1.25.

Turnips—Russia, per barrel, 75c. @ \$1.

## Philadelphia.

This market has been well cleaned up every day, but prices have been low; a large percentage of fruit arrives in poor condition, owing to the extremely warm weather. On Monday the market opened very slow and much stock was left on hand, very few storemen were buying and but few hucksters were on hand.

Strawberries are almost over and this week will probably be the last for the New York berries, which, during the last few days, have been selling from 5 @ 10c. per quart.

Raspberries have been small and inferior all around and but few crates realized over 3c. per quart.

Blackberries are very plentiful and keep low in price. Maryland, cultivated, are selling 4 @ 6c. per quart; Early Harvest, 3 @ 4c. per quart.

Currents are arriving in large quantities. One house received two cars on Monday, but the demand is small. Early red are held at 5 @ 6c. per quart; fair to good, 2 1/2 @ 4c. per quart. Large shipments in bulk are offered at 2 1/2 @ 6c. per pound, but these prices were seldom obtained. Dealers are holding for a better market.

Cherries—Sweet, 4 @ 5c. per pound; sour, 3 @ 4c. per pound.

Pineapples—Indian River, red, choice, 24 to crate, \$2.50 @ \$3; 30 to crate, \$2 @ \$2.50; smaller fruit, \$1.50 @ \$1.75 per crate.

Beets—Jersey, per 100 bunches, \$1.50 @ \$2.

Cabbages—Jersey, per 100, \$2 @ \$2.25.

Cucumbers—Norfolk, per barrel, \$1.25 @ \$1.75; per basket, 40 @ 60c.

Egg Plants—Florida, one-half-barrel box, \$1.25 @ \$1.50.

Onions—Maryland, one-half-barrel basket, 90c. @ \$1.25; these were very good and sold quickly; Jersey, per barrel, \$2 @ \$2.25.

String Beans—Jersey, wax, 60 @ 80c. per basket; Pennsylvania, wax, 7 @ 8c. per basket; Norfolk, green, one-half-barrel, 50 @ 60c.

Tomatoes—Jersey, choice, per basket, 60 @ 80c.; fair to good, 40 @ 60c.

Potatoes are moving more slowly. Jersey Rose are held at \$1.75 @ \$2.25 per barrel.

Watermelons are moving more freely; choice stock selling at \$25 @ \$30 per 100.

## Boston.

The strawberry season is now getting towards its end. A few home-grown Belmonts appear every morning and sell at about 15c. per quart, while Western Central New York sends three to five cars daily. Some very fine Atlantics bringing 14 @ 15c. As a range Atlantics would bring say 11 @ 15c. because some of the berries are not as large as others, and some arrive in softer condition. Some of their Bubachs sell 11 @ 13c., while the common small varieties bring all the way from 7 @ 10c.

A little Jersey corn shows up, but there is no sale for it because with every ear there are a few worms.

Mississippi tomatoes firmer, \$1 @ \$1.25 a crate; hot-house stock very steady, 15 @ 20c. a pound. Some Norfolks appearing bringing about \$1.50 a bushel.

Summer squash arrives in good condition, and meets with an excellent demand, 3 @ 4c. each. Strictly fancy marrow squash brings \$2 a barrel, while the inferior stock which arrives has a hard sale at \$1 @ \$1.25.

Currents can be quoted 3 @ 4c. per quart, or if in bulk 2 @ 3c. per pound. The "oldest inhabitant" cannot remember when there was so little demand for currents as appears this year.

Native red raspberries bring 10c. per pound, while Hudson River bring 3 @ 4c. for thirds.

Long Island beans and cabbage out of the market; home-grown beans, 75c. @ \$1 a bushel, with cabbage 5 @ 6c. a head.

Watermelons 25 @ 30c. each. Asparagus gone by; native beets or turnips, 50c. a bushel. Parsley, 50c.

Virginia potatoes, whether from Norfolk County or Eastern Shore, are in excellent condition, well matured, and good sized, quick sale, \$2.50 a barrel; red varieties sell as easily at about \$2.

Jersey Irish potatoes arriving and show fine size, bringing \$2.50 per barrel. Some Maryland early Harvests arriving, they supply a certain want and sell at wholesale, \$2.75 per barrel.

Le Conte pears bring all the way from

50c. to \$3 a barrel. Their condition varies more than these prices. Old apples are far gone, no need of mentioning. Mushrooms steady, 65 @ 70c. per barrel; with Black Hamburg grapes as steady at 50 @ 75c. a pound.

Kalamazoo celery unchanged, 40 @ 50c. a bunch; egg plants remain as last quoted; cauliflower, \$1.40 @ \$1.75 a barrel.

Hot-house cucumbers one and three-quarters of a cent apiece; peppers good demand, \$1 a bushel; peas, 30 @ 60c. a bushel.

Probably the last week was the busiest Fourth of July week Boston has seen for a long time. Intensely hot and large arrivals of most everything. The bulk of the crops in New England are looking well, considering the late spring, with the exception of corn, and that is very backward, but if the hot weather continues it will "catch up" before the middle of August. Rhode Island Irish potatoes will be dug this week, and it is claimed they are in excellent condition and a large yield.

The huckleberry harvest promises this year to amount to many thousands of bushels from the bushes which cover the mountain tops of Ulster, Orange, Sullivan and Greene Counties. The berries now coming to market sell at 15 cents a quart, but in a week or so the markets will be flooded with berries and 6 cents a quart will be considered a good price.

Old Berry Boxes.—The San Francisco Health Department has issued a circular to shippers of fruit, cautioning them against using berry baskets and other fruit packages a second time upon the penalty of confiscation.

## Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished. Mention American Gardening when you write.

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 600 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1897, New York City.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advt., and each initial or a number, counts as one word. No cuts or display type allowed.

HULSEBOSCH BROS., bulbs and plants, Englewood, N. J.

LOWEST PRICES on earth. Trees and Plants. Nell the Nurseryman, La Porte, Ind.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York

TRANSPLANTED CELERY PLANTS, all the leading kinds. John A. Smethers & Son, P. O. Box 104, Berwick, Pa.

CELERY PLANTS, strong and stocky, \$1.00 per 1000, \$5.00 per 10,000; satisfaction and safe arrival guaranteed; special low express rates. The most practical and complete book on celery culture, 75c. Peter J. Schuur, Kalamazoo, Mich.

CELERY PLANTS. Transplanted only. First-class, leading kinds. Greatly superior to seed-bed plants. Carefully packed; good for two weeks' transit. 40c. per 100, \$3.00 per 1000. R. M. Welles, Towanda, Pa.

CABBAGE PLANTS, strong and healthy, Flat Dutch, Fottler's Brunswick, Early Winnigstadt, Drumhead Savoy, \$1.50 per 1000. Special prices on large orders. Cauliflower, Early Paris, 40c. per 100. W. W. Nash, Montrose, Pa.

## WANTED.

[Rates, etc., same as in "For Sale" column.]

WANTED—A bright respectable young man, used to growing roses and carnations for commercial purposes, wages 15 dollars a month and board. Address Robt. Potfield, Castle Grove Greenhouses, Danville, Pa.

## Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

SITUATION as gardener's assistant, Scotch-American, age 21, thoroughly familiar with work of gentleman's place. Assistant Gardener, care American Gardening.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### A Fine New Rose.

Prominent among the roses which are giving a good account of themselves is the hybrid tea, known as Madam Abel Chatenay. It is one of the best of growers, with broad, glossy leaves, and an appearance of vigor throughout. It is giving the most perfect flowers of any of the young plants received this season. The coloring is unique and most attractive. The catalogue description names this coloring as creamy rose, shaded with rose vermillion, and tinged with salmon. The general effect is of a pink, so yellow as to make the old Duchess de Brabant seem almost a pure rose color, by comparison. The reverse of the petals is a very deep carmine, and as the petals recurve the contrasting shade in the beautiful heart of the rose is very deep and strong. No rose seen since Madam Cochet has been so pleasing.

#### The Fancy for Pelargoniums.

These beautiful flowers seem to be advancing in public estimation. That is, the fancy section known popularly as Lady Washington Geraniums is so advancing. They are much more often seen than formerly, and the exquisite colorings and immense size call forth ardent expressions of admiration. One firm offers the Lady Washington or Pansy Geranium and pictures a Geranium plant heavily covered with the similitude of Pansies. Our friends abroad consider us very much mixed on Pelargoniums. One horticultural paper in particular never uses the word Geraniums except in quotation marks, showing its popular misuse.

#### Forty Dollars a Year Per Hen.

One of the most successful poultry keepers in this country has said that one can make \$40 a year profit from a single hen by setting all her eggs and raising the chickens. At first thought this sounds a good deal like the "\$500 a year from 12 hens" story, but it does not take a great mind to see that 80 chicks at 50 cents each would bring in the \$40. Hence, it is by no means an impossibility. But there are numberless problems and plenty of labor ahead of the market-size chicks that bring in \$40 above the cost of raising. There must be capital, too; for, if all the eggs are set all expenses must come out of the pocket, directly, until the chicks are ready to sell. Taken altogether, however, perhaps one could not get a better, or, in the end, a cheaper idea of the pros and cons of poultry raising than by setting aside one hen and attempting to turn all her eggs for a year into chickens. It would certainly be great fun, or else—great misery!

#### Sliding Prices.

A certain poultry raiser had settled upon a scale of prices. Ten cents was named for baby chicks, fifteen cents for those three weeks old, twenty-five cents for those at five weeks. Mrs. A. contracted for twenty of the three weeks' chickens at fifteen cents each. She waited three full weeks, then called for the chickens, still expecting to buy them at fifteen cents each. She departed very much aggrieved at finding that the seller had advanced his price. Query: Where is the world's sense of justice? Why should any buyer expect three weeks' additional care and feed, and possible losses thrown in, when he has already bought at a fairly low price?

#### "Poultry Houses" for Women.

A prominent poultry paper refuses to devote a special department to women, on the ground that there is no difference in poultry raising in itself, whether it be man or woman that does the work. Yet a contributor to the

same paper makes a pretty good case in advocating small poultry houses for women, because they do not have to go inside such houses. Women's dress skirts are certainly a hindrance in the business. And if, as one correspondent says, "the idea of cleaning a poultry house twice a week and sweeping out the corners is enough to disgust any decent working man," what may be said of the delicate and often invalid women who drag their long skirts about "those dreadfully mannish" poultry houses?

#### Baked Surface Soils.

The word "baked" may be considered a general term, including surface hardening through whatever means. Fierce sun heat, heavy rains upon outside potted plants or continuous daily waterings upon the soil surface of those indoors may have very similar effects. The roots of the plants become smothered for lack of air. Green mold is allowed to fill the pores of both surface soil and pots, and it, too, works to choke the struggling plant or plantlet. No one state is worse for the plant than that of being smothered. Open the pores by all means, even as you would cleanse the pores of the body for its health and proper nutrition. Both body and plant take in from and give out to the air. Open the pores!

#### Moss for Surfacing.

A practical aid toward this work of keeping open pores is the use of moss. Laid upon the surface of the pots it not only renders the calls for water less frequent, but it prevents the mechanical hardening from the con-

stant falling of water on the surface. Still, there is need of warning those who may make an initial attempt at its use. It may cause either drought or overwatering, in certain cases. That is, one must make sure, by touch or sight, that the soil below the moss is in the proper condition; giving water or withholding, according to this sign. In a hot exposure the soil may be drier than one has supposed; in another it may be water-soaked, though several days have elapsed since the application of water.

#### Water as a Ration.

"Little and often" seems to be the constant motto of the fowl creation, both as to food and drink. The urgent need of a constant water supply for thirsty birds can be appreciated only by studying them. To go a step farther and assert that water plays, in some sense, the part of food, and really helps to build up the body, would seem foolish to many; how is it easily proven? But there are those who assert positively that to mankind water is really a food. If this be true it can hardly fail to be true, in degree, that it is food for fowls also. Fowls are greatly like human beings in many of the most important particulars.

MYRA V. NORRIS.

One of the best exchanges that comes to our desk is American Gardening. It is a live, up-to-date horticultural weekly, and while designed for the amateur and private gardener, is worthy of a careful reading by professionals.—New England Florist.

# A Life Saved.

## A FOND DAUGHTER WAS NIGH TO DEATH.

**Frank B. Trout Tells a Reporter of How His Daughter's Life Was Saved. All Parents Should be Interested in This Narrative.**

*From the Evening News, Detroit, Mich.*

Using as a nucleus for his investigation the rumor that the life of the daughter of Frank B. Trout, well known in Detroit, Mich. real estate circles, had been saved, a reporter called on Mr. Trout at his office, 103 Griswold Avenue. Mr. Trout showed some hesitancy in giving his opinion for publication, but finally said: "Circumstances and a father's love for his child forced me to try Dr. Williams' Pink Pills for Pale People, but not until the whole medical profession had exhausted their skill. At the age of fourteen we had to take our daughter from school owing to her health. Before this she had been in the best of health, happy and in the best of spirits. She began to fall away and became pale and languid. She was so weak that she would fall down in a faint everytime she tried to walk unsupported. The best of physicians attended her, but she continued to grow weaker and seemed to be gradually fading away.

"When she was fifteen she weighed only ninety pounds, and the doctors said it was anemia. Several physicians said she might outgrow it, but that it would no doubt terminate in consumption. No doctor we had could help her, and we concluded ourselves, we must lose our child, as she was growing weaker every day.

"We had tried all the well known remedies, and finally about a year ago I bought a box of Dr. Williams' Pink Pills for Pale People and took them home. That day I had read of a case about the same as my daughter's, and decided to give them a trial, though I must confess I did not have much faith. Before she had taken all of the first box we noticed a change for the better. She, however, gained strength daily and looked brighter. Everyone

noticed the change, and I bought two more boxes for her.

"When she had taken two boxes she was strong enough to leave her bed, and in less than six months was something like herself. To-day she is entirely cured, and is a big, strong, healthy girl, weighing 130 pounds, and has never had a sick day since.

"I do not think she uses them now, though I always keep them in the house. My wife and I have recommended them to our neighbors, and sent a few to another young girl who seems to be in the same condition as my daughter. Had not Dr. Williams' Pink Pills saved my daughter's life, I would not recommend them to any one. I know they do all and more than is claimed for them, and I am glad to recommend them to the world. I know Dr. Williams' Pink Pills for Pale People saved my daughter's life, and that is enough for me."

F. B. TROUT.

Subscribed and sworn to before me this fourth day of March, 1897.

ROBERT E. HULL, JR., Notary Public.  
Wayne County, Michigan.

Dr. Williams' Pink Pills for Pale People contain, in a condensed form, all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are also a specific for troubles peculiar to females, such as suppressions, irregularities and all forms of weakness. In men they effect a radical cure in all cases arising from mental worry, overwork or excesses of whatever nature. Pink Pills are sold in boxes (never in loose bulk) at 50 cents a box or six boxes for \$2.50, and may be had of all druggists, or direct by mail from Dr. Williams' Medicine Co., Schenectady, N. Y.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is an index of our subscribers' interest in the paper.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call to push circulation. Understanding thoroughly the value of the paper to every one interested in gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER PREMIUMS SUMMER

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us **AT LEAST** one new subscriber before the close of the season.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only **seven new subscriptions at \$1.00 each.**

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Beautifying Country Homes.** By J. WEIDEMANN. A handbook of landscape gardening. This is the most elegant and useful work on the subject ever issued in this country. It is beautifully illustrated with numerous fine wood engravings, and with 17 full-page and 7 double-page colored lithographs of places already improved. It contains general directions for lawns, roads and drives, walks, hedges, trees and shrubs, gardens, ornamental grounds, hints on burial lots, etc., etc. The beautifully colored plans of improved places are accompanied by descriptions giving the names and positions of the various trees and shrubs employed in planting, thus providing a complete planting map. Cloth, 4to. Reduced from \$15.00 to \$10.00.

*Given for 20 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. Handsomely illustrated, cloth, 12mo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Canning and Preserving Fruits and Vegetables, and Preparing Fruit Pastes and Syrups.** By ERMENTINE YOUNG. This work gives a full account of the best methods by which the surplus fruits may well be saved for home use and for the large market demand, and a handsome profit accrues

to the home workers. A practical chapter on evaporation of fruits is embodied in the book. Paper, 20 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases, dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo., cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit and Fruit Trees of America,** or the culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. By A. J. DOWNING. Second revision and correction, with large additions. By CHARLES DOWNING. This work has no equal in the country, and deserves a place in the library of every pomologist. It gives descriptions of all the finest varieties of fruit, native and foreign, cultivated in America, and contains the names and synonyms of over 10,000 varieties. Over 1100 pp., with several hundred outline engravings, including supplements. 8vo., cloth. \$5.00.

*Given for 12 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Grape Growers' Manual.** (The Bushberg). An exhaustive work on the cultivation of the grape, with accounts of diseases, insects, etc., by specialists. The descriptive list of varieties is specially useful and complete; the typographical method of designating importance of varieties is a feature. Pp., 200. Royal 8vo. Illustrated. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Gardening for Pleasure.** By PETER HENDERSON. New and enlarged edition. A Guide to the Amateur in the Fruit, Vegetable and Flower Garden, with full directions for the Greenhouse, Conservatory and Window Garden. This is a complete encyclopedia of horticultural information, treating on soils, fertilizers, the lawn, garden designs, culture and care of plants, greenhouse building, heating, cottage and window gardening, the orchard, and many other important subjects. A monthly calendar of operations is also appended, which will act as a first-class guide to the amateur horticulturist. Illus., cloth, 12mo. \$2.00.

*Given for 4 new subscriptions at \$1.00 each.*

**Gardening for Profit.** By PETER HENDERSON. A guide to the successful culture of the Market and Family garden, profusely illustrated. Although written mainly for the market gardener, the amateur interested in vegetables or fruits can easily adapt its teachings to the smallest requirements. Cloth, 12mo. \$2.00.

*Given for 4 new subscriptions at \$1.00 each.*

**Greenhouse Construction.** By PROF. L. B. TAFT. A complete treatise on Greenhouse structures and arrangements of the various forms and styles of Plant Houses for professional florists as well as amateurs. All the best and most approved structures are so fully and clearly described that anyone who desires to build a greenhouse will have no difficulty in determining the kind best suited to his purpose. The modern and most successful methods of heating and ventilating are fully treated upon. Special chapters are devoted to houses used for the growing of one kind of plants exclusively. The construction of hotbeds and frames receive appropriate attention. Over one hundred excellent illustrations, specially engraved for this work, make every point clear to the reader and add considerably to the artistic appearance of the book. Cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**How to Grow Cut Flowers.** By M. A. HUNT. A thoroughly practical treatise on the cultivation of the Rose and other flowering plants for cut flowers. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**How to Know the Wild Flowers.** By MRS. WILLIAM STARR DANA. A guide to the names, haunts, and habits of our common wild flowers. The most handy and easy reference book for amateurs. With 100 illustrations by Marion Satterlee. 12mo. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Henderson's Handbook of Plants and General Horticulture.** By PETER HENDERSON. This has long been acknowledged as the standard American work on general horticulture, giving history geographical distribution and cultural directions for all cultivated fruits and flowers. Illustrated. Cloth, 8vo. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Insects Injurious to Fruit.** By PROF. WM. SAUNDERS. A work of great value to all fruit growers, written by a man of science as well as a practical agriculturist, and the result of careful and minute observations and experience. It treats, under separate chapters, of the injurious insects which prey upon our fruit trees, vines and bushes, together with their mode of operation, and contains careful directions as to the best means of destroying them. With over 400 pages, 440 illustrations. 12 mo. Cloth. \$2.00.

*Given for 5 new subscriptions at \$2.00 each.*

**Johnson's Gardener's Dictionary.** This is a new and revised edition, greatly enlarged, of "Johnson's Cottage Gardener's Dictionary," first published in 1846; containing a full and reliable list of every plant in cultivation, names printed in bold type, rendering reference easy. An important feature of the work is the placing of synonyms alongside the correct name, instead of in a separate list. The habitat of each variety is given along with the date of its introduction. The cultural directions are brief and to the point. Insect foes, diseases and their remedies are fully described, and figures of some of the former have been given. Handsomely bound in one volume. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Landscape Gardening or How to Lay out a Garden.** By EDWARD KEMP. Intended as a guide in choosing, forming or improving an estate (from a quarter of an acre to a hundred acres in extent), with reference to both design and execution, with numerous fine wood engravings. Cloth, 12mo. \$2.50.

*Given for 6 new subscriptions at \$1.00 each.*

**Parsons on the Rose.** By SAMUEL B. PARSONS. New and revised. A treatise on the propagation, culture, and history of the Rose. Illustrated. \$1.00.

*Given for 3 new subscriptions at \$1.00 each.*

**Peach Culture.** By JAMES ALEX. FULTON. New, revised, and enlarged edition. The only practical guide to Peach Culture as followed on the Delaware Peninsula, but essential to those cultivating this fruit in any other part in the United States. Fine cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Popular Flowers and How to Cultivate Them.** By E. S. RAND, JR. Illustrated. New edition, with appendix, revised and enlarged. Crown, 8vo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Poultry Culture.** By K. FELCH. How to raise, manage, mate and judge thoroughbred Fowls. Cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Practical Floriculture.** By PETER HENDERSON. A guide to the successful propagation and cultivation of Florists' Plants. As in every work from this gifted author's pen nothing has been left unsaid that bears on the subject. Illustrated. Cloth, 12mo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Profits in Poultry.** Useful and ornamental breeds and their profitable management. This excellent work contains the combined experience of a number of practical men in all departments of poultry raising. It is profusely illustrated and forms a unique and important addition to our poultry literature. Cloth, 12mo. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Secrets of Rose Culture.** By W. J. HATTON. In this neat volume are described all the newest and most improved designs for building rose houses, heating, ventilation, management, and much other valuable information on rose culture. The latest and best varieties of roses for every purpose and condition are named, and their special values pointed out. 162 pp. Illustrated, 12mo., paper. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Strawberry Cultivist.** By A. S. FULLER. Containing the history, sexuality, field and garden culture of strawberries, forcing or pot culture, etc., fully illustrated. Flexible cloth, 12mo. 25 cts.

*Given for 1 new subscription at \$1.00 each.*

**Success in Market Gardening.** By W. W. RAWSON. Illustrated. This work is written by one of the most successful market gardeners in New England, who gives here the results of his life-long experience in the growing of vegetables out-of-doors and under glass, with special adaptation to the climate of New England. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Art of Propagation.** By J. JENKINS. A concise, practical treatise on the rapid multiplication of vines, plants, trees, etc., detailing the management in propagation of seeds, bulbs, cuttings, etc., and the manner of operating in grafting, budding, inarching, etc. Ample illustrated. 30 cents.

*Given for 1 new subscription at \$1.00 each.*

**The Amateur Orchid Cultivators' Guide Book.** By H. A. BURBERRY, F. R. H. S., orchid grower to the Right Hon. Jos. Chamberlain, M. P. Tells how to grow Orchids, in cool, intermediate, or warm houses, successfully. There is a calendar of operations for each month, and full information as to the treatment required by all orchids mentioned in the book. Just published. New edition, colored plates. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**The Nursery Book.** By PROF. L. H. BAILEY. This is a complete handbook of propagation of plants treating on seedage, separation and division, layerage, cuttage, graftage, including grafting, budding, inarching, etc. It tells plainly and briefly what everyone who sows a seed, makes a cutting, sets a graft, or wants to know. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Dictionary of Gardening.** A Practical Encyclopedia of Horticulture. By GEORGE NICHOLSON, A. L. S., assisted by some of the most eminent writers in the botanical and horticultural world. The Dictionary of Gardening is the most complete work of the kind ever published; the practical information and botanical classification have been brought down to the latest date, and nothing has been neglected to make it in all respects the standard work on horticulture in all its branches, from the growing of the hardiest plants to the cultivation of the most delicate exotics. It is the recognized authority of the Society of American Florists on nomenclature of plants. Illustrated, with more than 2370 first-class engravings with numerous colored plates of exquisite finish and life-like exactness. 4 vols., cloth, large, 8vo. Prepaid, per volume, \$5.00; complete, \$20.00.

*Given for 40 new subscriptions at \$1.00 each.*

**The Horticulturist's Rule Book.** By L. H. BAILEY, Professor of Horticulture in the Cornell University. This volume is the only attempt ever made in this country to codify and condense all the scattered rules, practices, receipts, figures and histories relating to horticultural practice, in its broadest sense. All the approved methods of fighting insects and plant diseases used and discovered by all the experiment stations are set forth in shape for instant reference. This feature alone is worth the making of the book. Among the additions to the volume, in the present edition, are the following: A chapter upon "Greenhouse and Window-Garden Work and Estimates," comprising full estimates and tables of heating glass-houses, list of plants for forcing, for cut-flowers, for window-gardens, aquaria, and the like, with temperatures at which many plants are grown, directions for making potting-earth and of caring for plants, etc. A chapter on "Literature," giving classified lists of the leading current writings on American horticulture, with publishers' addresses and prices, and a list of periodicals, and directories of officers of whom the bulletins of the various experiment stations may be obtained; lists of self-fertile and self-sterile fruits; a full account of the method of predicting frosts and of averting their injuries; a discussion of the aims and methods of phenology, or the record of climate on the blooming and leafing of trees; the rules of nomenclature adopted by botanists and by various horticultural societies; score cards and scales of points for judging various fruits, vegetables, and flowers; a full statement of the metric system, and tables of foreign money. Third edition, thoroughly revised and recast, with many additions. 12mo., 302 pp. Limp cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**The New Onion Culture.** By T. GREINER. This new work is written by one of our most successful agriculturists, and is full of new, original, and highly valuable matter of material interest to every one who raises onions in the family garden, or by the acre for market. By the process here described a crop of 2,000 bushels per acre can be as easily raised as 500 or 600 bushels in the old way. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**The Rose.** By H. B. ELLWANGER. Revised edition. A treatise on the cultivation, history, family characteristics, etc., of the various groups of roses, with names and accurate descriptions of the varieties now generally grown, brought down to 1892. This work contains full directions for planting, pruning, propagating, and treating of diseases, and insect pests, and is particularly valuable for its classification and full alphabetical lists of one thousand and eighty-six varieties. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**The Shrubs of Northeastern America.** By CHAS. S. NEWHALL, author of "The Trees of Northeastern America," etc. This volume is beautifully printed on beautiful paper, and has a list of 116 illustrations calculated to explain the text. It has a mine of precious information, such as is seldom gathered within the covers of such a volume. Illustrated, 8vo. \$2.50.

*Given for 5 new subscriptions at \$1.00 each.*

**The Small Fruit Culturist and Nursery Directory.** By A. S. FULLER. This is the first work devoted exclusively to small fruits, and completely covers the ground of propagating, culture, varieties, preparing for market, etc. Thoroughly illustrated, cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**The Treasury of Botany.** Edited by LINDLEY and MOORE. This is a popular Dictionary of the Vegetable Kingdom, with which is incorporated a glossary of botanical terms. Twenty steel plates and numerous wood cuts. Two parts, Fcp-8vo., 1372 pp. \$3.50.

*Given for 10 new subscriptions at \$1.00 each.*

**Tomato Culture.** By J. W. DAY, D. CUMMINGS, and A. I. ROOT. In three parts. A valuable treatise, embracing field culture, forcing under glass, and raising plants for market. Of value to any one growing garden truck of any kind aside from tomatoes. 150 pages. Illustrated. Paper. 40 cents.

*Given for 1 new subscription at \$1.00 each.*

**Trees of the Northern United States.** (Their Study, Description and Determination). By Prof. AUSTIN C. APGAR. This handbook is to the trees of its locality what Gray's well-known Manual of Botany is to the other plants. It furnishes a complete key to the wild and cultivated trees found east of the Rocky Mountains and north of the southern boundary of Virginia and Missouri. Preceding the key are chapters discussing the essential organs of trees and terms needed for their description, and the plans and models for tree description. The book is profusely illustrated, handsomely bound, and will be sent to any address on receipt of price. Nearly 500 illustrations, cloth, 12mo. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**Vegetable Gardening.** By PROF. S. B. GREEN. This is a manual on the growing of vegetables for home use and marketing. It is brimful of practical information and is carefully and cleverly written. The chapter on manures is of especial value. Cloth, 224 pp., profusely illustrated. \$1.25.

*Given for 3 new subscriptions at \$1.00 each.*

**Vegetables, How to Grow them.** By E. WATTS. 40 cents.

*Given for 1 new subscription at \$1.00 each.*

**Vines and Vine Culture.** (Considered the best book on Grapes). By ARCHIBALD F. BARRON, ex-superintendent of Royal Horticultural Society's Garden, Chiswick; Secretary of the Fruit Committee. Demy 8vo., handsomely bound in cloth. 3d edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Wild Flowers in Art and Nature.** By J. C. L. SPARKES, Principal of the National Art Training School, South Kensington, and F. W. BURBIDGE, Curator of the University Botanical Gardens, Dublin. With 21 full-page colored plates, by H. G. Moon. Handsomely bound, gilt edges. \$4.

*Given for 7 new subscriptions at \$1.00 each.*

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

Gandy strawberry has given good satisfaction as a late variety this season.

Varieties have much to do with success in fruit growing.

We like to go over a young orchard every week or ten days to examine the trees and see that they are all right in every respect.

The successful fruit grower must keep up with the times.

If not already done the stakes and other support for the tomato vines should be attended to at once.

For training his tall-growing varieties of peas one grower drives stakes about twenty feet apart along the rows and to them fastens two strands of heavy manilla binding twine, one about twelve to fifteen inches above the ground, the other about two and one-half to three feet from the ground.

This makes a good support for peas where there is not plenty of brush.

If we do not use system in our work how can we expect to accomplish best results?

In towns where there is a number of small fruit growers who generally have considerable fruit go to waste why not organize a stock company among themselves to evaporate what is left over?

It does not look now as though apples would be very plentiful this season.

In the new peach orchard the young shoots which make the most vigorous growth are cut back considerably, so that those which have made less vigorous growth can come up with them, thus making a well-balanced tree.

Six to eight inches of straw mulch will carry a raspberry crop through a dry season quite successfully, but twelve inches would be still better.

A good-sized building should be on every large-sized berry plantation for convenience in storing boxes, crates, tools, etc.

Many berry growers have come to believe that irrigation will be a more necessary factor in the production of fine fruit than improvement in varieties.

Among both large and small fruits those which are given the highest sounding names are generally the surest to be a failure.

There is still considerable money in dwarf pear growing if on the right soil and the grower is a good pruner.

Judging from present indications, the Gregg raspberry is, as it has been in the past, a good standby with a large crop of very fine marketable berries.

The young chickens are being "pushed" with good, hearty food to get them off to market before the "drop" in price comes.

Freeman is quite desirable as an early potato for the table, but has one fault—the dry rot. Often a peck will have to be thrown away in selecting out a mess of perfect ones.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to  
whose efforts the present growing popularity of the Water Garden is largely due, is designed  
to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The book will be freely illustrated with plates and illustrations in the text, and will  
describe all operations, from the growing of plants in tubs to construction of the large pond,  
planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

## The Early History of Sweet Peas.

BY S. B. DICKS.

Copyrighted 1897 by the A. T. DeLaMare Printing and Publishing Co. Ltd.,  
Rhinelander Building, New York.

So widespread and intelligent an interest is now felt in America in all that concerns Sweet Peas, that no excuse is necessary for presenting a few facts connected with their origin and early history.

Hitherto the Botanical Dictionary of Curtis has been the authority usually cited, but it should be borne in mind that Curtis was a trader as well as a botanist, and that the apparent object of his valuable work is to present such facts relating to the subject treated of, as would be connected with the introduction of the plant into Great Britain, and in particular that part of it which comprised his own Botanical Garden.

### EARLIEST MENTION OF THE PLANT.

The earliest mention of the plant that I have been able to discover is in the *Historia Plantarum* of Joannes Bauhinus, Ebroduni 1650-51 where (on the authority of Jas. Justice), it is catalogued as *Lathyrus angustifolius, flore ex albo and rubro variegato, odorato*. In the *Hortus Blesensis* of Robert Morrison, London, 1669, I find *Lathyrus latifolius annuus, siliqua hirsuta*. This in some respects resembles the Sweet Pea, but if this surmise be correct it must be the purple variety that is referred to. Conjecture gives place to certainty when we turn to the *Historia Plantarum* of John Ray, London, 1686-1704, where we find in Book XVII. "*Lathyrus major à Siciliæ; a very sweet-scented Sicilian flower, with red standard; the lip-like petals surrounding the keel are pale blue. Its seed pod is hairy.*" In another part of the same work the plant is quoted as "*Lathyrus distoplatyphyllos, hirsutis, mollis, magno et perameno flore odoratissimo purpureo,*" but the latter word has been added to Cupani's descriptive name on the authority of Domenico Sheard.

The next and by far the most important work is the *Hortus Catholicus* of Father Franciscus Cupani, Neapoli, 1696. The reverend Father was not only a very devout Italian monk, as a

perusal of his book amply testifies, but also a most enthusiastic botanist. Pickering in his *Chronological History of Plants*, Boston, 1873, states that Cupani was "the first cultivator of the Sweet Pea," at Panormus, in Sicily, in 1699; but of this we shall speak later. The work is merely a catalogue of names, and the Sweet Pea appears simply as quoted above from Ray. No color is given, neither is anything said as to the country of its origin.

### CUPANI AND HIS WORK.

Since the foregoing was written, I have been able to examine the first work published by Cupani, viz.: "*Syllabus Plantarum*

*Siciliæ-nuper detectarum à P. F. Franciscus Cupani, Panormi, 1696.*" It is a very small work, 12 mo., and among the plants newly discovered in Sicily by Cupani, is the *Lathyrus distoplatyphyllos*, etc., afterwards transferred to the Hort. Cathol. published in 1696.

As the name of Cupani naturally occupies such an important place in the early history of Sweet Peas, the following facts in connection with his history may be of interest to the reader: Franciscus Cupani was born in 1657, and in the year 1691 became a monk, his order having their location in the neighborhood of Panormi. In addition to the two purely botanical works referred to in this article, and which were published in his lifetime, he had prepared for the press his *Pamphytum Siculum*, an illustrated natural history of plants, animals, fishes, etc. Cupani died in 1711 and the work was first published in the following year.

The interest taken by Cupani in the sweet pea is evidenced by the zeal with which it was distributed by him. In 1699 some seed was sent to Dr. Uvedale at Enfield, England, where the plants were visited by many eminent botanists. Some seed was also sent by Cupani to Caspar Commellin and the result was an illustration of the plant in the *Horti-Medici Amstelodamensis*, published in 1697-1701. It is a fine folio work and in Vol. II. tableau 80 is given a full page drawing, very well executed, showing the foliage as we now know it; the heavy footstalks mostly carrying two flowers. (See fig. 144.) The individual flowers are large, with the standards

FIG. 143.—SWEET PEA BLANCHE BURPEE.—FINEST TYPE OF THE MODERN SWEET PEA.

mostly rounded and well developed, but among them are a few monstrous forms; these, however, are very variable in character. The name given on the head line is *Lathyrus distoplatyphylus*, *hirsutis*, *mollis* et *odorus*.

In a very elaborate article which appears on the opposite page the following passage occurs: "I am sowing seeds of this most elegant and very pleasant plant lately received from the Reverendo admodum Patri Francisco Cupani, who was pleased to communicate with me, and to send me these from Panormo, together with other somewhat rare seeds, in the beginning of 1599; which being sown, in the same year produced flowers and seeds, of which plant for the sake of the elegance and pleasantness which it possesses, I have wished to set forth a delineation and description by that name which the Reverendus Pater Cupani has proposed for it in the catalogue of the most learned and excellent Catholic Prince.

"This *Lathyrus*, an annual, rises to a height of 6 or 7 feet; the root is thin, the stalks compressed, solitary, projecting from both sides, on these stand two wide and oblong leaves on a foot-stalk, which is compressed, foliated and raised, which footstalk ends in tendrils. From the wings of the leaves on longer pedicles spring butterfly like flowers which are large and have a purple standard, the remaining petals are sky-blue. These flowers have a very pleasant smell."

Rivini, whose *Introductio Generalis* (Lipsiæ 1690-99) is cited by Ruppil as an authority for the name, figures *Lathyrus siliquis hirsutis*, A. Annual, which is doubtless intended for a plant of the sweet pea, but as the object of the author is simply to call attention to the hairy pods no illustration of the flower is given.

#### LINNAEUS' DESCRIPTION.

Before referring to the numerous botanical works published in the early part of the 18th century it may be well to introduce here the description of the plant as given by Linnaeus in his *Systema Plantarum Europæ*. Under *Lathyrus pedunculis* section *bifloris* we find *Lathyrus odoratus*:

a. *Lathyrus siculus*. Rupp. Ien. 210. *Lathyrus distoplatyphylus*. Comm. hort. 2, p. 219.

b. *Lathyrus Zeylanicus*, odorato flore amoeno ex albo et rubro vario, Burm. Zeyl. 138 Knip. Cent. IV. N. 37.

Habitat: (a) In Sicilia; (b) in Zeylona (Ceylon).

Of the authorities cited by Linnaeus, the first is of very great importance because from it we learn that the white variety is of Sicilian origin.

In the *Flora Jenensis* (Francfort, 1718), H. B. Ruppil places in the class for plants with irregular flowers, *Lathyrus siculus*, Rivini (see above) and states: "In gardens they generally call it the musk-scented *Lathyrus* (*L. moschatum*). Sometimes it varies with a white flower."

The reference to the Hort. Amstel. of Commelin has already been fully dealt with.

#### THE SWEET PEA OF CEYLON.

Respecting the *Lathyrus Zeylanicus*, Burm. Zeyl. is the *Thesaurus Zeylanicus*, setting forth the plants native to the Island of Ceylon, published at Amsterdam 1737 by Joannis Burmanni, Med. Doct. et Botanices Professoris in Horto Medico Amstelodamensis.

In this work the plant appears as follows: "(a) *Lathyrus Zeylanicus*, flore amoeno ex albo et rubro vario. Nobis.

"(b) *Lathyrus Zeyl. hirsutis* flore variegato odorato Hert. Hart.

"This plant differs from the *Lath. odorato* of Cupani only in the variety of the flower, and since it has been well described and set forth in Hort. Amst. part 2, we do not further describe it here, since also, in addition, these

plants are well known to all since they frequently occur in our gardens."

The reference to Nobis I have not been able to verify, but regarding Hert. Hart. Burmannus says: "Hartog or Hertog is a herbarium which I keep and which it is certain contains very many most elegant Zeylanian plants, and was sent once by him from Zeylana to Cornelius Vossius, the gardener at Amsterdam."

In the same work also appears a variety, *Lathyrus Zeylanicus*, rubro pul-

published at Magdeburg a work entitled

"Botanico in Originali Sev. Herbarium vivum; Linnæi et Ludwigi."

The work is in several volumes of folio size and in Vols. II. and V. are given colored illustrations of pressed flowers of the Painted Lady sweet pea.

In Vol. II. the stalks carry two flowers (see Fig. 145), while in Vol. V. they are one-flowered only (see Fig. 146). I

FIG. 144.—*LATHYRUS DISTOPLATYPHYLLUS hirsutis mollis et odorus. LATHYRUS odoratus Siculus et LINN.*

(Reproduced from *Horti Medici Amstelredamensis* Vol 2, Fig. 80, 1697-1701.)

From a sketch made from the original engraving by Mr. G. H. Dicks (son of the writer of this article, by special permission of the Principal Librarian of the British Museum, London.

cher. The omission of the word *odorato* may be accidental; if so, we have here the red variety, also ascribed to Ceylon. This is cited by Burmannus on the authority of the *Prodrum* of Breynius, published at Gedani, 1680. If this surmise be correct these two varieties were known at the same time as Cupani was calling attention to those of Sicilian origin.

The reference to Knip. Cent. IV is a very important one. In 1757-1763 Johann Hieronymus Kniphof, a celebrated Professor of Medicine at Erfurt,

am of opinion that the first picture represents a cultivated plant and the second represents a dried specimen sent to the artist from Ceylon. Both illustrations are thus named:

"*Lathyrus pedunculis*, *bifloris*, *cirrhosis*, *diphyllis*, *folio-ovatus* oblongis, *leguminibus hirsutis*. Linn S. P. 732.

"——— *odoratus* *Zeylanicus*."

It is remarkable that Kniphof should give the barbarously descriptive title on the authority of Linnaeus, and that at a later date Linnaeus should adopt

in his "Systema Plantarum" the shorter name on the authority of Kniphof. The two illustrations vary slightly in some minor details, but they are evidently meant for the same plant. The colors are those of the Painted Lady, as now grown, but the standards are small and of poor substance, the wings being in each case the most prominent parts of the flower.

#### AN IMPORTANT DISCOVERY.

During the summer of 1896, while inspecting for Cooper, Taber & Co., a field of the Mrs. Sankey growing on a strong, rich loam, I discovered a plant identical in every respect with Kniphof's illustrations. I dried the plant as carefully as possible and have had much pleasure in handing it over to the editor of American Gardening,

coloring is a uniform greyish-purple, shaded with brick red, but the latter is evidently added from artistic motives.

#### FIRST TRADE OFFER OF SWEET PEAS.

The first trade offer of sweet peas is contained in the explanatory catalogue of the aforesaid Robert Furber, but only the purple variety is quoted. This had evidently come into his possession through Dr. Uvedale, to whom it had been sent by Cupani.

In the "Universal Gardener and Botanist," published a few years later under Lathyrus, we find: "Varieties of, are, purple-flowered sweet pea, white-flowered sweet pea, variegated or Painted Lady sweet-scented pea." The careful reader will note a slight difference in the description of the latter va-

"No. 176. Lathyrus odorate flore albo et rubro variegato.

"No. 177. Lathyrus odorate flore purp. et rubro variegato."

"The first-named," says Justice, "is the Lathyrus angustifolius flore ex albo et rubro variegato odorato, mentioned by J. Bauhinus, 1650. (Any person carefully examining the dried specimen now in the hands of the editor of Am. Gardening will recognize the appropriateness of the name). This is the Painted Lady pea vulgo, a variety seminal of the 177, but not so sweet smelled." Respecting 177 he says: "This is the Lathyrus distoplatyphylus of Hort. Cathol., the sweet-scented pea vulgo; of this kind of pea there is both the purple and the white-flowered."

#### THE PARENT OF THE RACE.

Before resuming our consideration of the works of later writers I may here remark that the opinion of Justice that the Painted Lady is the parent of the race is shared by Mr. Eckford, who, in a complete list, with which he has kindly furnished me, styles the Painted Lady "the original variety." There seems no reasonable doubt that it was known to botanists before the Sicilian purple. One singular fact in connection with it is that while Pickering states on the authority of C. C. Sprengel, whose work, "Gehimniss der Natur," was published at Berlin in 1793, that "Linnaeus received the sweet pea from Ceylon and on this account calls it the Lathyrus odoratus of Ceylon," the plant is not mentioned under any name by Linnaeus in his "Flora Zeylanica," published in 1747. The absence of the plant from this important work may have caused other botanists to bring it under the notice of the illustrious Swede, for very shortly after, in his "Systema Plantarum," we find him adopting the name from the work of Burmannus, published 1737.

#### THE SWEET PEA OF SICILY.

If the sweet pea is truly of Sicilian origin it is very remarkable that no mention is made of it in that very complete work by Paolo Bocconi, "Icones Plantarum Siciliae, etc.," published 1674.

During my visit to Naples in 1896 I brought these facts to the notice of that eminent authority, Mr. G. Sprenger. He courteously undertook to investigate the matter during his approaching trip in Sicily and has, since his return, written me as follows:

"I retain that the plant is really a native of the two most important Italian islands, Sicily and Sardinia. I have just come from Sicily, where I could see the plant in the neighborhood of Corleone, a town lying in the interior on a range of hills, and in several other wild regions round about, together with other papilionaceae. The plant has all the appearance of being of spontaneous form and not an imported one. The above locality has been but very rarely visited and it is apparently to be excluded that L. od. was brought there. It is surprising that the Lathyrus has been found in but a few places, but this does not mean much. From what I could deduct the plant grows in three or four places in Sicily and it has also been found in Sardinia. Our most learned men retain that the Lathyrus is really an indigenous kind in Sicily, because it presents all the characters of being of spontaneous growth. The flowers of our kind are purple (purpurea) while those of Ceylon are rose-colored. This could be a variation due to the climate, but I was unable to find out if the Lathyrus varies or if the white-flowered variety is found growing spontaneously."

The statements of Mr. Sprenger are in full accord with the quotations from Cupani's Syllabus given above, and until further evidence is forthcoming I am compelled to question the correctness of the position taken up by Justice and Eckford. The evidence of the authorities quoted in this article leads me to the conclusion that the purple and

FIG. 145.—*LATHYRUS pedunculis bifloris*, cirrhis diphyllis, foliis ovato-oblongis, leguminibus hirsutis. LINN. S., P. 732. LUDW. D. G., P. 488.  
odoratus zeylanicus.

(Reproduced from Kniphoffii Vol. 2, 1757-1763.)

From a sketch from the original engraving, made by Mr. G. H. Dicks (son of the writer of this article), by special permission of the authorities of the Patent Office Museum Library, London, England.

and he will doubtless be very pleased to show it to any caller interested in this subject.

#### FIRST COLORED ILLUSTRATION OF THE FLOWER.

Retracing our steps to the year 1730 the first colored illustration of sweet peas that I have been able to discover is contained in a set of very fine engravings afterwards painted by hand and entitled, "Twelve Months of Flowers," designed by Peter Casteels, from the collection of Robert Furber, gardener at Kensington, and engraved by H. Fletcher. The flowers of the various months are arranged in the form of bouquets and in the June number appears the purple sweet pea. The form of the flower is very loose and straggling; the standard small and reflexed and the wings very large and

riety, but the point to which particular attention is here directed is that at this awkwardly arranged (see Fig. 147). The time three quite distinct varieties were known and cultivated in ordinary gardens in England. This naturally leads us to "The Scots Gardiners' Director," by James Justice, F. R. S., Edinburgh, 1754. At that time a great effort was made by the Dutch dealers to capture the British trade in flower seeds and their catalogues were sent broadcast through the land. Referring to these catalogues, the said Justice observes that "they are neither rightly named botanically or otherwise." He then proceeds to quote from the

"Catalogus van Schoone Bloem-Zaaden te vinden by  
Dirk and Pierre Voorhelm  
Bloemists te Haarlem.

white varieties are of Sicilian origin, while the Painted Lady and most probably the red have their origin in Ceylon.

As no history of sweet peas would be complete without a reference to "Curtis's Botanical Magazine," 1788, I copy the following from Vol. II., p. 80. After giving the Latin descriptive name, as it appears in the Kniphoff, he writes: "There is scarcely a plant more generally grown than the sweet pea, and no wonder, since, with the most delicate blossoms, it unites an agreeable perfume. Several varieties of this plant are enumerated by authors, but general cultivation extends to two only; the one with blossoms perfectly white, the other white and rose-colored, commonly called the Painted Lady pea."

The sweet pea is described as a native of Sicily, the Painted Lady as an inhabitant of Ceylon. The colored plate accompanying this description is a little too red in tone for the purple, as now grown. A reproduction of it with the same fault appears in the "Ladies' Manual of Botany," published 1798. It is possible that the deep purple shade is a development, for in Ray's work, before referred to (pub. 1686) the standard is described as red, which term might be used for a reddish purple.

#### THE SWEET PEA IN FRANCE.

The early French botanists do not appear to have taken very kindly to sweet peas, for the earliest reference I have been able to discover is in a work entitled "Plantes de la France. Décrites et peintes d'après nature par M. Jaume Saint Hilaire, Paris, 1809." The French name is given as "Gesse odorante" and the known "variétés" are described as follows:

- 1ere. étandard de couleur rose, ailes et carène blanchâtres.
  - 2e. étandard de couleur pourpre-violet ou violet-noirâtre, ailes et carène de couleur bleu.
- Fleurit; durant les mois de Juillet et d'Aout.
- Habite: la 1ere. variété est originale de l'île de Cellan; la 2e. se trouve en Sicile.

The accompanying colored plate shows a complete branch with two blossoms on each stem. The coloring has been done entirely at the artist's fancy, as different colored flowers appear on the same stem; while the colorings of the unopened buds would, could they be discovered in nature, drive those enthusiasts, Eckford and Hutchins, wild with joy.

#### AS AN ARTICLE OF COMMERCE.

With this as a final reference to literary authorities, we may leave this branch of our subject and very briefly touch upon the seedsmen's connection with the sweet pea as an article of commerce. Reference has already been made to the offer of Robert Furber, in 1730, and also that of Dirk and Voorhelm, in 1754. Next in order is the catalogue for 1793 of John Mason at the sign of the Orange Tree in Fleet Street, London (the original founder of the business of Cooper, Taber & Co.), wherein I find quoted: Black, purple, scarlet, white, and Painted Lady. This list shows that some intelligent work had been done during the previous thirty-nine years, but by whom I am unable to discover. The catalogues issued by this firm did not exhibit any change for many years, but in 1837 James Carter founded his business in Holborn, and in his first catalogue quoted black, Painted Lady, purple, scarlet, white, striped, and yellow. To the foregoing Noble, Cooper and Bolton, in 1850, added new large, dark purple, and mixed, showing that two selections had been made from the parent purple variety.

Shortly after this date it became customary for the wholesale seed merchants to quote in their vegetable seed list Nasturtiums, Mignonette and Sweet

Peas, and in 1873 Robert Cooper quoted the latter in this way:

Sweet Peas, mixed.  
do. do. named.  
do. do. white.

This style continued until 1881, when they were simply offered as sweet peas mixed and named.

This fact is of interest, as it records a peculiarity in the treatment of sweet peas at that time. For some reason, which I never clearly understood, several of the wholesale seedsmen did not include the white variety in their mixtures unless it was specially ordered, but in the 70's the practice was generally abandoned. The indifferent germination of the brown-seeded white varieties has always been a source of trouble to the seedsmen and this may in some measure account for the custom.

Going back as far as 1860, James Carter offered blue-edged, to which the

The seeds of this variety were sold at two pence (4 cents) each, but no word of complaint came from the purchaser, for its character had been thoroughly fixed before it was placed upon the market.

About 1868 the Crown Princess of Prussia appeared in Germany, an introduction as distinct and valuable as any that had been offered. Who really was the raiser of this variety I have not been able to discover. It has generally been assigned to Mr. Ernst Benary, but that gentleman writes me disclaiming the honor, although it was offered in his catalogue for 1870.

(Since the foregoing was written I have learned from Messrs. Haage & Schmidt, Erfurt, that Crown Princess of Prussia was sent out by them in 1868-69. The same firm also sent out Fairy Queen in 1873-74 and in the same year offered a lilac variety which they claimed to be superior to Captain

FIG. 146.—*LATHYRUS pedunculis bifloris*, cirrhii diphyllis, foliis ovato-oblongis, leguminibus hirsutis. LINN. S., P. 732. LUDW. D. G., P. 488.  
odoratus zeylanicus.

From a sketch from the original engraving, made by Mr. G. H. Dicks (son of the writer of this article), by special permission of the authorities of the Patent Office Museum Library, London, England.

Royal Horticultural Society gave a first-class certificate many years later. On August 22, 1883, this novelty was first named Blue Hybrid, and it was understood to have been a true hybrid between the annual white sweet pea and the perennial Lord Anson's blue. It was the outcome of a series of experiments made with the object of raising a real blue-flowered variety by Colonel Trevor Clarke, of Daventry (vide Gard. Chron., Mar. 6, 1897). The Butterfly offered by Sutton & Sons, in 1880, is practically identical with this variety.

On July 11, 1865, a first-class certificate was awarded to Stephen Brown for Invincible Scarlet, which, if properly grown, is one of our very best varieties to-day, and is undoubtedly the parent of the brilliant-colored class.

Clarke; later on this variety was omitted from their list and Captain Clarke retains possession of the field. A very pretty and distinct variety named Bronze King is the latest introduction of this well-known firm.—S. B. D.)

In 1880 Carters offered Violet Queen, an entirely new color, but a very poor flower. Adonis was offered by the same firm in 1882, but this was displaced in 1883 by the New Carmine Rose of Muskett & Sons, afterwards renamed Princess Beatrice, and, to this day, one of the most popular and beautiful of the rose section. From this time onwards the purely descriptive names appear to have been discontinued and the questionable practice of naming new varieties of this lovely flower after titled and untitled nobodies came into vogue.

## ADVENT OF ECKFORD.

In 1832 Eckford entered the field with *Bronze Prince* and the history of sweet peas from that time has mainly consisted of a record of his triumphs. Of the other European growers Laxton undoubtedly occupies the foremost place, but the good work by J. C. Schmidt, Haage & Schmidt and Lorenz, in Germany, ought not to be ignored. France has been content to occupy a back seat, for no variety now in commerce is of French origin.

## THE "CUPANI OF THE WEST."

The work of Eckford has been so fully placed before the American public by the Rev. W. T. Hutchins that it is only necessary for me to record here my unstinted praise for the foresight, patience and skill he has all along displayed. Whether he will be able to maintain his position as leader in the face of the great wave of Western competition, the close of another decade will show. Of the work done by that

## The Flower Garden.

We are now between seasons—a time for weeds.

Violets will need attention if we desire good strong crowns. We know the result of neglecting this work; at planting time we shall have clumps too large, made so by a useless growth of runners. It seems a pity to cut these runners away, as so little will be left, but if the plants had been trimmed from time to time during the summer this would have been unnecessary, and what is more important, larger and stronger crowns would have been secured. The California violet did so well with us last winter that we shall put in more this season; it is remarkable for long stems, fragrance, and fine color. Every time we go over our plants we break up the soil to half an inch; dry soil acts as a mulch. It is the same with all crops, and we always aim to run through the garden after a rain.

Carnations need topping frequently to keep the plants bushy.

FIG. 147.—THE PURPLE SWEET PEA. (No. 33.)

As it appears in the set of engravings published under the title of "Twelve Months of Flowers," by Robert Furber, Gardener at Kensington, in 1730.

Photo-engraved from a set of engravings in the possession of Harry Simpson, Esq., F.R.H.S. 90 Southwark Street, London, England.

"Cupani of the West," the Rev. W. T. Hutchins, this is not the place to write; but a passing reference may be permitted to the remarkable parallel existing between the position and work of the Eastern and Western enthusiasts. I trust that the spirit of the true botanist which animated Cupani will continue to animate the work of Mr. Hutchins.

**Cambridge, Mass.**—A petition has been presented to the Park Commissioners calling their attention to an effort now being made by a representative committee to secure 140,000 square feet of land in Cambridge adjoining the homestead lot and the residence of "the late James Russell Lowell, poet, statesman and scholar," in whose memory it is proposed to create and perpetuate a public park, to be known as the Lowell Memorial Park.

**Fenimore Cooper**, the novelist, is to be commemorated in Cooperstown, N. Y., by the throwing open as a park of the property which once was his. The area is five acres. The expense is being borne by the Clark family.

**Cyclamen** old corms, or roots ought to be potted up now. They are usually slow to start. We have not rested our plants as much as usual, and at potting time find a goodly number of green leaves on them. Leafy plants have better roots, and though they lose these leaves, I allow them to stay on as long as any vitality is left. Opinions differ as to the best soil to use. My experience is that ordinary good loam suits; more depends upon the condition the plants are in when started, and old corms with few live roots seldom make good plants. The roots should be potted firmly and not over watered. Generally cold frames shaded with laths are used and answer well, better, I think, than when shaded sash are used. Ours are grown in a cool greenhouse with top and bottom air continually on.

**Seedlings** should be making nice growth, and be ready for four-inch pots. Chinese Primulas will soon be ready to move from the seed pans, using light soil, —half leaf-soil and loam with a dash of sand. It is not too late now to sow Primula seed.

The first batch of Cineraria seed may

go in at anytime, they germinate readily enough, but are hard to take care of when up, during hot weather; and no satisfactory growth is made until cool weather comes.

*Coreopsis Drummondii* makes a useful plant for winter blooming, and seeds are sown now to have plants early.

It will soon be time Pansies are sown. The seed often gets badly washed by heavy summer rains, or even by frequent watering, to avoid this we put on a light covering of straw, removing it little by little until the plants are large enough to care for themselves.

Chrysanthemums are making good growth; they will need frequent stopping, and, in fact, should be looked over daily. It is important the plants be kept in shapely form. Such as were put into the final pots in May will be ready for a top dressing of rich soil. These will take liquid manure from now forward. Dregs from the barnyard, diluted to about one-eighth strength is a good safe article.

Those who were fortunate enough to have a stock of the semi-double Ragged Robin, *Lychnis flos-cuculi*, will find it a splendid plant for cut flowers during late winter. It is seldom out of bloom—those forced last winter are blooming nicely now.

**Antirrhinums** are useful for cut flowers in winter; if we get a good strain, we may grow them from seed for winter flowers, but most growers propagate from cuttings. We have a nice even lot of seedlings all saved from one plant—a white variety. About 25 per cent. have come lemon-yellow, and we are pleased, if anything.

It is quite time to put in cuttings of fancy *Pelargoniums* and *Geraniums*, cuttings from *Poinsettias*, taken with a heel from old plants, are being put in as fast as we can get them. This is a better way I think, than taking pipings. We shall take cuttings until late, in order to get a variety of sizes. Nice plants a foot or so high can be grown in five-inch pots.

**Hydrangeas** must be closely pruned after blooming and only the healthiest shoots left. T. D. HATFIELD, Mass.

## The Fruit Garden.

**Peaches** should have an abundance of water given them now and until the first fruits begin to color. The trees do not take kindly to many sprayings of Bordeaux or insecticides; therefore, endeavor to promote a healthy growth, which will act as a foil for diseases. Watch for any sign of fruit rot, and pick it in the early stages, instead of leaving it to mummify, and hang on the trees until the spring pruning, or later. Too often, even then, it is only considered as an old dried peach, it being forgotten, or perhaps, not known that it is often very much alive then with fungous spores all ready for another season's work.

**Plums.**—The above remarks as to rot apply here also.

**Cherries.**—Sometimes when the picking is finished, there are still many rotten fruits hanging. Try to shake or thrash them off when damp; then rake up and bury.

**Cherry or Pear Slugs.**—I note that there are a few of these at work again. They can be easily stopped with one of the insecticides. (See page 491, issue of July 10, 1897.)

**Grapes.**—Some time ago I called attention to a bug somewhat like the rose bug, but broader. These are now on hand and so is the grape curculio. The last, on bright days, is smart enough to be almost amusing, for at the slightest movement of the hand in sight, down it drops far more quickly than the hand can get under it. Where numerous, jar as for plum curculio, using a catcher if necessary. If the bugs are on this won't worry you, and the other bug will eat its fill of insecticide when the vines are sprayed. Don't run off with the idea that because the bunches are bagged, everything is right, for it won't be so if the foliage is allowed to mildew. JAS. HOLLOWAY, L. I.

## Roses Under Glass.

### Work for the Hot Weather.—Disbudding.

We lately had one of the hottest weeks I have ever known; still, in going through the unshaded houses, I found but very few traces of burning. At the same time what few plants were slightly affected with mildew are now entirely free from it. It has been my experience, when the young stock commences to take hold of the new soil, and we get bright, warm weather, so long as they receive their proper syringings, this disease is thoroughly checkmated.

There is now lots of work to be done in the houses, and as the heat is almost unbearable during mid-day we should make the most of the early morning hours and during dull periods to accomplish it. With the constant syringings the soil will soon begin to turn green and sour, preventing the air working through it, and making it almost an impossibility to water properly.

To get the best results from plants growing outdoors frequent cultivation is resorted to and it is just as important, and a little more so, that the same should be practised inside. Once a week is none too frequent to stir the surface soil. It should be superfluous for me to mention that weeds should not be allowed to gain any headway at any time; if they do the soil will very soon become greatly impoverished. It is surprising how rapidly and what a large amount of early available matter they take out of the soil.

Disbudding should not be neglected on any account. There seems to be a little difference of opinion as regards the stage of development when the bud should be picked off. We always make it a practise to go over the houses twice a week and pinch off every tip wherein a bud is discernible. My experience is, where buds are left to develop almost to opening the wood becomes very hard and the next growths are not only slower in coming, but are not so strong as when disbudded earlier. In other words, the substance which goes to build up bud and flower, if stopped in time, is directed to other channels, which are more desirable at the present—wood and foliage. If we wish to get the best returns during winter there is no greater mistake than to let our plants flower, even if they are cut with a short stem. All roses will crop more or less and I find the oftener we go over the plants and disbud the more it tends to prolong the crop.

Drip from the roof may seem to some a very trifling item, especially if there is very little of it; but not only is the health of the plants with which it comes in contact seriously impaired, making them an easy prey for fungus diseases, which contaminate the healthier ones surrounding, but it is invariably a starting point for black spot, which is so disastrous to the varieties susceptible to it. Remedying drip is time and money well spent.

While mentioning black spot, now is the time for us to use every means in our power to get entirely rid of it before fall arrives. Every leaf or part of one on which is found a particle of black spot should be picked off.

In regard to insects, we have a few at this season that must be looked after. Butterflies should be killed or the caterpillars they breed will quickly disfigure the plants by chewing up the young foliage. The May bug larva, a large, fat, ugly grub, with brown head, is oftentimes very troublesome, killing some of our finest plants before we are aware of its presence. Be as careful as we may to watch for these pests, while turning our soil and putting it in the houses, we are almost certain to leave some remaining. It is no difficult matter to detect a plant attacked by one of them, as when its base is reached it takes them but a very short time to cut the roots clean off and girdle the bark just above the callous,

causing the plant to wilt badly during sunshine. Most generally a plant attacked is of no further use, so lose no time in putting it up and replanting another in its place. Before doing so, however, be sure you work the soil over until you catch the grub; otherwise, you can be assured of losing another plant in the immediate vicinity very shortly. They generally work from one plant to another.

During the hottest weather green fly is not very troublesome, but if we get a short spell of cool weather it most generally puts in an appearance. I am very adverse to fumigating a rose house, but it is about the only practical course open to us just now for the extermination of green fly. If carefully done no harmful effects need be feared. It is best to fumigate when the houses are cool. I don't like the temperature to stand over 70 degrees. This oftentimes necessitates the fumigating being done in the evening, so just before quitting time we place in the houses, thirty-five feet apart, a wisp of stems the size of a six-inch pot with a pinch of shavings to each. It is then an easy matter to close the ventilators and light the piles, about 8 o'clock, leaving in the smoke for a couple of hours, after which time ventilation is again resumed. Very little tobacco smoke is needed at this season to kill green fly, so fumigating should be lightly done. A thorough, sharp spray from the hose early next morning will clean the flies out entirely.

## Early Ripening of Fruit.

### Inducing Fruitfulness.

It is not difficult to so manipulate a branch of a peach, pear or apple tree as to cause it not only to ripen its fruit ten days or more in advance of the ordinary season but to greatly increase its size.

Trees take in their food from the soil; minerals dissolved in water, which passes from cell to cell through the centre of the tree until the leaves are reached, where it is digested, so to speak, and is combined with carbon from the atmosphere and the assimilated food passes downward immediately under the bark, building up the wood cells and developing the fruit.

Now if we check the downward flow of the sap by pressing the bark it throws the food back and the fruit appropriates it, causing an abnormal growth and speedy maturity. This can be readily done by twisting a small wire tightly around the limb just below the fruit. It is better to remove all but the one specimen and great care must be exercised not to get the wire so tight as to rupture the bark and thus destroy the branch. It only requires a slight compression to accomplish the work. After the fruit has matured the wire must be removed.

Grape growers who practise "ringing" understand this to perfection. They cut out a band of the bark about a quarter of an inch long just below the cluster to be affected. It then appropriates all the resources of the shoot and often more than doubles its size, but the limb must be cut out at the next pruning, as the girdling kills it.

It often happens that a young tree will not develop fruit buds, but such can be made to do so by suddenly checking its growth when its wood buds are about half formed so as to cause them to develop into fruit buds. A fine wire is twisted around the body of the tree only once and left two or three weeks in July and August so as to cut off the downward flow of sap.

The same effect can be accomplished by a straight, thin cut directly around the tree, merely severing the bark. It will draw apart and fill with gum, quickly healing; but the check is secured and a good crop of fruit sure for the next season. This should be done not later than the middle of July.

R. M. KELLOGG, Three Rivers, Mich.

## The Manuring of Orchids.

### Experiments on Cattleyas.

Some interesting experiments, says the *Gardeners' Chronicle*, have recently been made with a view to determine the gradual degeneration that takes place in some cattleyas. For this purpose the expedient of analyzing cattleyas at the time of importation, and after some years when degeneration had set in, was resorted to. It was noted also that the production of flowers is an exhaustive process and that little is done to compensate for the loss.

"The result of these experiments shows that cattleyas, when degenerate, contain less dry matter, organic substances, nitrates and ash. Among these elements, diminution is evident in the amount of potash, lime, magnesia and phosphoric acid—that is to say, in the principal fertilizing elements. The cattleyas were grown in a soil almost destitute of fertilizing matter, and their weakness is attributable to the production of the flowers for which they were cultivated. To verify this the experimenters proceeded to analyze the flowers and discovered what amount of loss of fertilizing elements these plants sustained as a consequence of flowering. It may be said that the organic matter of the flowers contains a considerable quantity of nitrogen, and that the ashes are particularly rich in potash, lime, magnesia and phosphoric acid. The dwindling of cattleyas in respect of these elements is, therefore, explained very clearly in this way, the results plainly showing that degeneration of these plants is attributable to the exhaustion caused by the production of flowers.

"From the standpoint of practical horticulture we may conclude from this investigation that cattleyas should receive, to counteract this degeneration, a mixture of suitable manures, containing nitrogen, phosphoric acid, potash, lime and magnesia."

The following information on the same subject, furnished to the Orchid Committee of the Royal Horticultural Society by Mr. A. H. Smee, is very interesting. Mr. Smee experimented with an old and starved variety of *Cattleya Trianae*. He says:

"I fed this plant once a week, during the growing season, with two or three ounces of water, which contained nitrate of potash, nitrate of ammonia, phosphate of ammonia and carbonate of magnesia, of the strength of half an ounce of nitrate of potash and half an ounce of nitrate of ammonia, with a small quantity of the other salts, with the result that the plant made stronger growth and produced a greater number of flowers, which were brighter in color. In 1896 I tried a larger number of plants and I was so satisfied with the result that in 1896 I added nitrate of potash and nitrate of ammonia each week during the summer to the rain water tanks of the cattleya house. The total quantity used during the summer was one pound of the nitrate of ammonia and one pound of the nitrate of potash. This worked out at the rate of 2.5 grains per gallon. Many of the flowers of the cattleya this year were larger, brighter and had more substance than in previous years.

"This year I intend to increase the amount to five grains per gallon during the summer, that is to say, from May to September. I also propose to treat some of the plants with small quantities of phosphate of ammonia and carbonate of magnesia, in addition to the nitrate of ammonia and potash. I expect that I shall be able to make a favorable report on a future occasion on the results of these experiments.

"I expect further observations will prove that the assimilation of phosphates by plants sets free the phosphorus, which combining with the nitro-hydro-carbons of the tissues will tend to promote inflorescence, and will probably increase the germinating power of the seed of epiphytal orchids."

## Success With Sweet Peas.

For several seasons the majority of those planting Sweet Peas in this part of the country (Central Illinois) have grown more disappointment and even discouragement, than they have flowers. Only those who had clayey soil, with plenty of water, have been fully successful, thus proving the statement of all the books that a clayey soil, made rich, is best for Sweet Peas. The summer of 1896 was particularly unsatisfactory. An early spring permitted unusually early planting, and the plants came up well, but though apparently vigorous and healthy, they died in the most discouraging way.

The writer thought at first that the frightful mortality was due to rank manure. It was learned, however, that others who had used no manure suffered in the same way. It was, apparently, the blight peculiar to Sweet Peas that has been spoken of as appearing in different parts of the country.

That spring the Peas were planted exactly according to the method most approved up to that time. Two inches of year-old manure was spaded in deeply; the soil was known to be unfavorable, being an old driveway of cinders three inches deep over light loam, but it was thought great care would offset the extreme lightness of the soil. The seed was,

failed with it, and that loose soil might have caused the blight in many places, an entirely different plan was taken. As the soil had been so little occupied last summer, owing to the epidemic that had cleaned out the Sweet Pea population, exactly the same ground was used.

No spading was done, the soil being simply loosened about two inches deep with a hoe, and the seed planted less than two inches down in two double rows north and south, the single rows being six inches apart. Two of these double rows were put in, each thirty feet long, and with four feet between the double rows, just the same length and number of rows as last year. Nineteen varieties were planted, and the soil was pressed firmly over the seed. Owing to rain in March the planting was later, being on the 16th and 22d. The seed germinated well, as it did before, and by April 20 this note was made:

"All up well, and growing well. All thick. No failures anywhere. Good, stocky plants. Weather has been cloudy, wet, and cold, but with little freezing."

The vines all grew thriftily and rapidly from the start. They were hoed once, but there was no pulling of the soil towards them as before. The only sign of the blight has been the death of one vine after it had got nearly four feet tall, and it may have been damaged at the root in some way.

FIG. 148.—A SWEET PEA PATCH.

on March 10, put under two inches of soil, so that a three-inch trench was left after planting. In two weeks the plants were coming up finely and in the cool spring weather made rapid and vigorous growth. When about six inches high they began dying; a plant would wither at the top, and in a day or two be dead to the roots. No cause could be found. The manure was blamed at first, but others who suffered the same way had used no manure. Then, too, it would seem that all the plants would have died about the same time. But they did not. The rows got taller fast, but all the time individuals were falling by the wayside, sometimes two or three in a foot. They kept it up until the last, even after they had been blooming well. The first ones blossomed May 10, remarkably early for this section, but the vines were so thin by this time that there were few blossoms. The most picked in any one week was 1,284 from July 12 to 19. The vines died rapidly after that, and by August 10 were all dead. It should be stated that they had all summer been watered with a spray nozzle whenever the ground at the roots began to get dry, and that by June the soil had been pulled up, so that the trench was filled.

This spring (1897), acting on a suggestion by Rev. W. T. Hutchins of Indian Orchard, Mass., who, in a circular letter on Sweet Pea planting, said the trench system must be abandoned by those who

There have been frequent rains so that but one watering was necessary. The vines are on poultry netting five feet high, and now, July 10, are near the top and a mass of the delicate Sweet Pea green, surmounted by the dainty blossoms of white pink, lavender, maroon—a picture that delights the eye and heart of all who see it.

The first blossom came out on Extra Early Blanche Ferry on June 6. That was later than last year, but earlier than any one else here. The season has been three weeks later than in 1896. A week later twenty Extra Early Blanche Ferry were picked. Blanche Burpee and Stanley came out on the 14th; Kate Tracy and Emily Henderson on the 15th; Brilliant on the 16th; and New Countess, Alice Eckford, Crown Jewell, and Mikado on the 17th. By June 18 all were in bloom and 200 blossoms a day were being picked. The number of blossoms has increased steadily. In the week from July 1 to 7 the total of stems (two and three blossoms on a stem), was 3,944. All were large and fine, with most of the stems six and eight inches long. This was in spite of the fact that the hottest weather in this section in many years began about July 1. The last half of the week it was daily 98 and 99 degrees in the shade. The vines are now showing the effects of heat and drought, but it has turned cooler and rained, and it is thought the great productiveness will be kept up for some time.

The conclusion is that we must do as Mr. Hutchins says, experiment until the method best adapted to our particular locality and soil is found, and then to follow it with care and patience, and some success is sure.—H. C. SCHAUB, Decatur, Ill.

## The Vegetable Garden.

**Onion Blast.**—Last year our onion crop was attacked by a comparatively new disease, now known as the "White Blast;" many of the tops were covered with white spots and the tips withered away. The patch was kept thoroughly cultivated, and the ground was well prepared, the onions had till this date grown vigorously, but they became a sick-looking lot, and nearly all the leaves bent entirely over at the middle. My impression at first, was, that it was an attack of some onion blight, for which I frequently sprayed them with the copper fungicides, but apparently to no purpose. Being at that time a near neighbor of the Rhode Island Agricultural Experiment Station, I sent them samples of the trouble and sought a remedy for it. I also sent at the same time a sample to Prof. Slingerland of Cornell, a well-known authority on insect life. He said the disease was new, and that it had given much trouble over a wide extent of the country. The disease is caused by one of the Thrips (Thrips tabaci), a very minute yellow insect, scarcely visible to the naked eye; these small insects may be found in the axils of the leaves, and also in the underside of the bend of the tops, where they hang down. Several generations of the pest occur during the season. Prof. Slingerland recommended spraying with kerosene emulsion diluted with ten parts of water. I applied this remedy to a portion of the crop, and it proved quite effective, and the result was a fine crop of onions, and I took several premiums with them at the Agricultural Fair. The definition of the trouble by the Professor of Horticulture at the Rhode Island Institution was wrong, he claiming it to be the onion blight, recommending the use of the Bordeaux mixture. This, as already explained, I had already used frequently, without effect, but on another portion of the crop I continued its use without any satisfactory result. After reading Prof. Slingerland's description of the trouble, I hunted up the little yellow insects, and with the aid of a small microscope, I could clearly see them. The two diseases are quite distinct, though similar in effect and general appearance; the White Blast is caused by a diminutive insect, the onion rust, or blight, by a species of fungus, and is more of a decayed brown color; it is, therefore, important the distinction should be understood, before any successful remedy can be intelligently applied.

**Microscope.**—All such cases as the above tend to show the absolute need of a convenient microscope to every cultivator, as an aid towards the fighting of the many insect and fungous enemies of the garden. A knowledge of these, and best method of keeping them in check is requisite before successful results can be attained.

W. M. EDWARDS, Conn.

## Blackberries Drying Up.

I have some Snyder blackberries planted on the west side of a tight board fence. They bear heavily, but quite a number of the berries turn black and dry up before reaching maturity. What is the cause of this and is there a remedy?—CONRAD BOLINGER.

—If there is no evidence of disease on the wood or foliage, the cause is probably heavy cropping with lack of moisture at the roots. Blackberries will stand almost any quantity of water in July. More details might have shown more light on the trouble.

## Saul's Nurseries.

The greenhouses and nurseries of the late J. Saul at Washington, D. C., have been disposed of. The grounds are taken by W. S. Clark. The greenhouses are taken by J. Boyle, superintendent of the zoological gardens; he will raise Violets, Carnations, and Vegetables.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1897.

PUBLISHED BY

A. T. DELAMARE PTG. & PUB. CO. LTD.

ROSE AND DUANE BLDG.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt. P. O. Box 1897.

REGISTERED CABLE ADDRESS

Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

**Dwarf Fruit Trees.** WE have on more than one occasion before this taken the opportunity of advocating the use of dwarf fruit trees under certain conditions, and despite what may be said to the contrary by certain other teachers we continue in our course. The mistake that is usually made whenever the subject is brought up for discussion is that the participants argue from severally different standpoints, and instead of debating the adaptability of dwarfs in special cases, assume that the question is the wholesale planting of dwarfs for commercial purposes. Then again, for their successful culture, dwarf fruit trees demand an amount of care and constant attention that would be much grudging by the ordinary being, one who has not an absorbing passion for gardening.

On the other hand, for those who desire to become acquainted with the various varieties of a fruit, and who have not the space to spare for large orchards, the dwarf tree is a practical solution of the difficulty.

A correspondent writes to us in these words:

So little is given in general fruit literature about dwarfing fruit trees, their care, trimming, etc., in fact, very little attention seems to be given to the subject in this country. Can you tell me of any places near New York with dwarfs? Dwarf fruit trees in Germany and England have been a great delight to me. I have been in hopes that some of your correspondents would treat of the subject, for I believe it would be of great interest to a great number of gentlemen who raise fruit for the love of it. The owner of a very small place could have all the fruits known, and would find an endless source of pleasure in the care of dwarf trees. And I believe the raising of fruit, with a growing love of it, will do more for humanity than all the preachers.

While it is true that dwarf fruit trees are not extensively grown in the vicinity of New York, there are, however, a few estates having them, among which may be mentioned W. Rockefeller's, Tarrytown, N. Y., at this establishment may be found a nice lot of standard and half-standard trees which are fruiting profitably, and of still more interest in these same gardens is the cool orchard house, where pears, plums, peaches, nectarines, cherries, apricots, etc., are being grown in pots, the pears and plums once seen will never be forgotten. (Further reference will be made to this house in a later issue.)

There are several other homes on the Hudson River where a few trees may be found.

At Portchester, N. Y., at the new home of Mr. Quintard, Jr., are some dwarf fruit trees, but the garden is new as yet, so but little can be said about the trees at this date. On the walls are variously trained trees of pears, peaches, etc. The pears are mostly vertical cordons, trained on wires very near to the wall, and it is evident that for best results the trees will have to be trained on frame wires much further out from the wall, for the trees show signs of burning. The kitchen garden here is bordered with dwarf bush pear trees that are fruiting well, and near the garden paths are standard gooseberry and red currant bushes; these are worked upon standards about three feet from the ground, and their bushy heads, laden with fruit present a novel appearance. The trees and bushes, we believe, were imported direct from France.

That French gardeners are adepts at this art is well known, and that their example encourages its extension may be seen by crossing the Long Island Sound to Glen Cove and district. In the gardens of Charles A. Dana are to be found quite an assortment of cordon, espaller, and bush-trained trees, which, this season are carrying a very heavy crop of clean, healthy-looking fruit, especially the pears.

Near by on what was the old Barlow estate, now occupied by E. R. Ladew, are also to be found a large assortment of similarly trained trees; cherries in quantities have this season borne a heavy crop of fine fruit. All the garden paths are lined in some such a manner with the various fruit trees, and all are cropping well.

Near by again, on the Perkins' estate, under the care of F. G. Menze, is another old established garden where trained fruit trees may be found; while in the adjoining town, Sea Cliffe, is a veritable home,

a nursery where such trees are made and may be seen at all stages and in all sizes and styles. Mr. Ferdinand Boulon has for years been working up this stock, and while he is a commercial florist, he amply demonstrates the "intensive" possibilities of dwarf fruit growing in limited areas, his seven acres of land being edged and spaced out with hosts of fruit trees in endless profusion. The "Miniature Fruit Garden" of Rivers is about the only work to which our readers can be referred for detailed instructions upon this very interesting phase of intensive fruit culture—and that we believe is out of print.

**Fruit Prospects** THE crop report just issued by the U. S. Department of Agriculture shows as a whole that prospects for peaches, apples, and grapes are not so good as they were the same time last year.

With few exceptions, the reports on the peach crop are unfavorable. In New York it is said to be in rather poor condition; in New Jersey not very good; in Pennsylvania only moderate; in Delaware less than 10 per cent. of the average crop; in Maryland a small crop; in Georgia less than half a crop; in Kentucky average below last year; in Ohio almost an entire failure. The peach crop of Arkansas, on the other hand, is reported as good; the California crop fair; the Washington crop never better, and that of Oregon more promising than it was last season.

Of apples it is said that the crop is below the average, except in the far West and on the Pacific Coast. From all the North Atlantic States the reports are more or less unfavorable. In Ohio the fruit is dropping off badly, and indications are that the present condition of 46 per cent. will prove to be too high rather than too low. Michigan has an average of only 58 as compared with 99 at this time last year.

As to grapes, the crop in New York is said to be in poor condition; that of New Jersey fairly good; the crop of Pennsylvania, only moderate; while the crop in Delaware is generally fine; grapes in Virginia are reported as abundant and free from rot so far; in Georgia the crop promises well; Kentucky reports the grape crop in good condition; Ohio, as having suffered less than other fruits, but still not indicating an unusually large yield; in Indiana the crop has been injured by late frost; Missouri, nearly a normal crop of good quality; Kansas, the crop is very satisfactory; Nebraska, above the average, both as to yield and quality.—B. T. G.

**National Apple Shippers' Assn.**—The third annual meeting of this society is to be held at Hotel Iroquois, Buffalo, N. Y., on August 5, 6, 7. The Secretary of the association is A. W. Patch, 17 North Market Street, Boston, Mass.

## After One Year.

I have been a subscriber and close reader of AMERICAN GARDENING for nearly a year, and have this to say: AMERICAN GARDENING is an encyclopedia of information for everything pertaining to the cultivation and commerce of useful plants of every kind. After a year's perusal it must be proven an almost indispensable aid to the progressive professional or amateur horticulturist.—GEORGE B. ROBINSON, Bangor, Me.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Strawberries Henry and Mary.**—We have grown almost all varieties of berries, but have only found two really large fruited ones. The one is Mary, originated by the late H. Alley of this village, the other is called, here on Boyden Farm, Henry. We grow tens of thousands of quarts from each variety every year, and they are without doubt the largest and best of all grown in the whole world. I have had this season thousands of quarts of Mary, where from five to ten berries would make a heaping wooden quart, and I have preserved several in glass jars with formalin, so that all who doubt can come here and see for themselves. Some of these berries in the jars measure thirteen inches around. I am the present owner of the Seth Boyden farm. Seth Boyden originated the first large strawberry, perhaps, in the world (Agriculturist and others); he died in 1870. I then bought his farm, and have continued to grow strawberries from that time to this, and will say that I am positive the plant called Henry is beyond all doubt, not only the strongest plant, but the largest, best, hardest, and sweetest strawberry ever yet produced; color dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. I have grown it for the past four years for market in a small way, and this season nearly one-half of all that I grew was Henry; it will out-produce any strawberry plant that I have ever known, four year old plants giving very large, and just as fine berries as plants one year old. The plants as yet have shown no disease, while all other varieties, such as Great American, Jersey Queen, and nearly all varieties except those soft berries not good for market (Sharpless, Bubach, and others), have shown disease in the plant. The Mary this season could not stand the hot sun, and nearly one-half of all the plants burnt and dried up while full of berries. Mary will not bear the second season, but must be set every year, while of Henry, not a single plant has died, either old or young; it is the first berry ripe and the last. I am picking large berries from the Henry to-day, July 15.—H. JEROLAMAN, Hilton, N. J.

**To Destroy Spiders.**—Your article in issue of July 10, upon various uses of bisulphide of carbon is excellent. I wish to inquire if it will not be effective in killing spiders, and how much is required for a room twelve feet square. I tried fumes of burning sulphur, but the spiders were unharmed. If placed in the house in the early morning, could we occupy it at night? I trust this may be the means of removing the one bugbear of country life in an unplastered summer cottage.—J. W. B., Mass.

—Will some one with experience reply? We have never had occasion to use the bisulphide in a dwelling; it seems, however, that there would be considerable difficulty in using it, owing to the heaviness of the vapor. Hydrocyanic acid gas suggests itself to us.—Ed.

**Carbon Bisulphide.**—In your issue of July 10, page 488, was an article on "Bisulphide of Carbon," by G. M. Stratton, it was mentioned among other things that it was sure death to the phylloxera, a small insect that worked on the roots of grape vines. As I have been troubled with the phylloxera on my vines, under glass, and have tried all the remedies I could hear of, I would like to know of some one who has applied this carbon bisulphide, and with what results. The way to apply it for insects in the ground is very clearly given in the article referred to, but I would like to know more fully of the results.—GEORGE THOMAS, Chester Co., Penn.

**Tomatoes Under Glass.**—In your issue of May 29, Subscriber, Lowellville, O., states that he has had a Livingstone's Beauty tomato in his house for more than a year, and that it was then bearing 245 tomatoes. As I had never such a success with greenhouse tomatoes, I would like to learn his modus operandi.—SUBSCRIBER, Springfield, Mo.

**Dodecatheon Meadia.**—In reply to C. S. Doggett, Mass., he can obtain plants from me, for postage. They are not abundant here, but good plants may be had.—S. T. STERLING, Camden, Ind.

**Crimson Clover** was introduced in this country several years ago by the late Dr. Harzadine, a florist of Delaware; being a great lover of flowers he was attracted to this plant by its beauty. The rich deep green foliage which may be seen all through the winter when not entirely covered with snow, grows deeper and brighter as spring advances, until early in May when the flowers appear and the field changes from a deep green to a brilliant crimson, making a sight to behold and to remember. At first the value as a forage plant was not understood, and as a soil restorer was unknown. Every one admired its beauty and numerous plots were grown for ornamental purposes, but years elapsed before farmers awoke to its value as a regular rotation crop. Crimson Clover is now successfully grown in almost every state in the union. It will yield two to three tons of hay to the acre; or eight to ten bushels of seed; it makes a good fall and winter pasture, and is also a good honey plant, the honey being of light color and excellent flavor. Crimson Clover as a fertilizer has no equal; it sends its deep-feeding roots far into the subsoil to gather and bring to the surface elements of fertility that would be otherwise lost. Crimson Clover is an annual and must be sown in its proper season, this extends from the first of July until the last of September. About one peck of seed is required to sow an acre. I would advise sowing the seed in July, or not later than the 15th of August, if the ground can be got ready.—CARL B. CLINE, Columbus, Ohio.

**The Lungs of the City.**—From my point of view, there are two distinct objects in the setting aside of land for public uses in the form known as parks or public squares. One object is that of educating the taste of the owners of private places by the creation of model landscape effects, together with the gratification of the aesthetic taste of the community, and the other is the setting aside of land for the use of the public as a playground or for recreation. The one makes a park as a picture to be admired and studied, to be looked at, but not to be poked with a cane or an umbrella; while the other would make a park something more tangible—a thing to be handled and played with; the one would create lawns, vistas, and landscapes to be looked at only; the other would make playgrounds for children, trees for shade, paths and roads for the convenience and comfort of the public. It seems strange that most experts lean to one side or the other and see no merit in the claims of those who hold to the opposite theory. Some gardeners would put signs at every prominent point, warning trespassers of the dire penalty of using that which others would say was created for them; others would open everything to the public, laughing at the theories and fine philosophy of the aesthetic cranks, as they call them, who would make pictures of trees, shrubs, and lawns, regardless of the rights of the individual in them. There is surely a golden mean between these two extremes, especially if the people comprising the "public" which patronizes the parks can be made to realize that when they injure a park they are injuring their own property. It is a waste of time and money to set aside a large area of land in the form of a park and then exclude the public from it; on the other hand, it is possible to make the park so common that it is not appreciated even by those who overrun it. To exclude children from the lawns or the cool secluded nooks of a park is as bad on the one hand, as is the desecration of a bit of fine landscape by an incongruous building on the other. The parks are paid for by the people, and they should have the use

of them, not as artists, or gardeners, but as every day working men, women, and children. The rich can create and own their own parks, but the poor must rely upon the public breathing places or stifle and die in the crowded tenements. What our parks need is not more landscape architecture, but more individual freedom for visitors, and a higher and more conscientious regard for the privileges which should be allowed the individual.—PRO BONO PUBLICO.

## Strawberries.

## Mr. Hale on Summer Planting Again.

Your issue of the 17th at hand, and I note Mr. Dwyer's article upholding the summer planting of strawberries. I admire his pluck, more than his discretion, for it certainly does take pluck to advocate the profitability of buying and planting potted strawberry plants in midsummer, with the hope of any profit the next season.

My thirty years' experience in strawberry growing has taught me that the thing cannot be done except in rare instances.

My statement, in a former letter, that it would require 20,000 plants per acre to secure a profitable crop the next year, did not pretend to be a quotation from Mr. Dwyer, but a definite statement of my own; and I still hold to it, that if one is planting in midsummer, 20,000 plants are as few as it would be advisable to put out on an acre.

As to the cost of spring planting, perhaps I did not make myself clear, but the average planters of the country use from six to eight thousand plants per acre and these can be had at from \$20 to \$25, while with Mr. Dwyer's reduced price of \$13 per thousand for his potted strawberry plants, the cost would be \$260 per acre. Mr. Dwyer may be able to sell potted plants in July at \$13 per thousand, but no one else in America that I know of can do so, and I doubt that he would want to accept many orders at those prices. I think a call for plants for an acre or two in July would probably swamp him.

Mr. Dwyer says "let us have the truth if the heavens fall," and then says, "I did say, and I repeat it, that every pot-grown plant set in July or August would produce this season eight or ten plants, and that each of these plants would produce one-half pint of fruit each the next season."

Now let us figure a little to come to "the truth": of eight or ten plants the average would be 9, multiply the original 7,500 plants put out by 9, and we have 67,500 new plants, and, with the original 7,500 plants, we have 75,000 plants in all; half a pint to each one would give the next year 18,750 quarts, or 585 bushels. In most parts of the country this sort of "truth" would make a tumbling in the heavens. Now, as a matter of fact, has Mr. Dwyer ever produced that number of bushels of strawberries from an acre of pot-grown plants? Or can he tell us of any one in the country who has? I would not insinuate that there was any wilful misrepresentation on his part, but simply when one gets to imagining that there is a profit in the planting of potted strawberry plants, things begin to run wild. A man who will put out 7,500 potted strawberry plants in midsummer and secure one-fourth as much fruit as Mr. Dwyer estimates will have a crop that will astonish the natives.

The only way I know of to get a big crop of strawberries from summer planting is to crowd a great number of plants to the acre at the original setting, and as the cost of plants, if they have to be bought potted, practically eats up all the profit, I am still firmly convinced that an average market planter should always do his strawberry planting in the spring, unless his plants can be had for nothing from close about his home grounds.—J. H. HALE.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send ac. stamp for our new catalogue.

## For Present Sowing.

**TURNIP SEED.** We have all the best varieties.

**CUCUMBER SEED FOR PICKLES.** Our STOCKS are the Finest.

The first Consignment of our **SURE CROP, Mushroom Spawns,** just arrived.

Quality! **BETTER!!** than ever!!!

Descriptive Catalogue Free, by mail.

Offer No. 80.

FOR ONE NEW SUBSCRIPTION

## 200 CELERY PLANTS

AS FOLLOWS:

50 Plants  
White Plume.

50 Plants  
New Rose.

50 Plants  
Golden Self-  
Blanching.

50 Plants  
Giant Pascal.

This offer is from a first-class, reliable grower, and will be mailed, postpaid, for one new subscription to **AMERICAN GARDENING.** Orders for celery plants will be filled from now until August 15th.

AMERICAN GARDENING, P. O. Box 1697, N. Y.

## Built to Sit On, Not to Straddle.

## THE WHEELER BICYCLE SADDLE.

Every rider who has given the **WHEELER REFORM** a trial prefers it to all other saddles. Endorsed by physicians. Especially recommended for ladies.

We will send a Wheeler Bicycle Saddle as a Premium for Three New Subscriptions at \$1.00 each. Purchaser pays express.

AMERICAN GARDENING, P. O. Box 1697, NEW YORK

## PRIVATE GARDENERS.

### Appointments and Doings.

*Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.*

Charles F. Kleiner dropped dead on July 8. He was employed at Schenley Park, and had been afflicted for some time with heart disease. He was sixty years old, and leaves a widow and five children.

J. S. Reid, for many years foreman of the greenhouses of J. Wolf, Jr., at Philadelphia, died on July 4. He was born in Aberdeen, Scotland, in 1865.

Johann Lambert, of Lambert & Sons, the rosarians of Trier, Germany, died on June 23, in his 67th year. The roses Kaiserin Augusta Victoria, the Yellow Rambler, and many others were raised by this firm.

### Carnations for Private Place.

On page 495 of AMERICAN GARDENING of July 10, appears a request for information as to the most profitable varieties of Carnations to grow in a private establishment.

Having been growing Carnations for market very extensively for the past few years, and being at present in a private place, I think I am posted in this line. These are what I consider the very best varieties for the purpose named: Red, Jubilee, Pink, Albertini, Light pink, Daybreak, Dark pink, Tidal Wave, White, Lizzie McGowan, Yellow, Goldfinch, Variegated, Armazindy. Of course there are others, new and old varieties. I always try a few new ones myself, for I don't like to miss a good thing. William Scott is not listed, for the reason that it is not as good a flower as Albertini, and when it is off crop, it keeps off too long, and bursts badly in winter.—JAMES HARTSHORNE, Ill.

### A New Style of Greenhouse.

A departure in greenhouse construction, so far as this country is concerned, has been inaugurated by the firm of Dalledouze Bros., Flatbush, L. I., and is worthy consideration by gardeners and others. The chief interest lies in the great gain in head room for bush or other plants. The progress of this house, which is now filled with carnations, will be watched by us with considerable interest and reported upon as may be necessary.

The construction is an addition to a number of other houses, its dimensions are 20½ x 200 feet. The eaves protrude 5½ inches beyond the foundation line, this outward inclination of the sides giving more head room for the plants, and also gaining considerable light. Glass meets glass, and no lodgement for snow is possible. The sides are kept in position by means of braces attached to the iron rafters, whose perpendicular supports run down into solid foundations. These rafters carry the entire weight of the house, and no weight of any importance is evident at the eaves. Double ventilation is provided at the ridge, there being no side ventilation. The house is glazed with 16 x 24, double thick French glass. Lord & Burnham were the builders. The style of house has already been occasionally used in England.

### Oceanic, N. J.

The regular semi-monthly meeting of the Monmouth County Horticultural Society was held on Friday, the 16th inst. The principal business transacted at these meetings now relates to the coming exhibition to be held at Red Bank on September 1 and 2. At the last meeting, however, time was found to listen to an admirable paper on "Herbaceous Plants," which was read by Mr. Herman Stoye of Little Silver. Then was read a communication from the American Horticultural Society, suggesting the holding of a fall show in New York; on a motion the communication was laid on the table. August 6 is the date of the next regular meeting.

### Madison, N. J.

There was a good meeting of members of the Morris County Gardeners' and Florists' Society in Masonic Hall, Madison, on Wednesday, July 14. Five new members were elected and two proposed. The preliminary schedule of a proposed show to be held in New York in November under the auspices of the American Horticultural Society was read and discussed, but upon a motion it was decided to take no action.

The show committee reported that the McAlpin Hall, Morristown, had been secured for the show which will be on November 3 and 4. The schedule of prizes was discussed at length and passed, and owing to the lateness of the hour, the reading of Mr. C. Totty's paper on the "Chrysanthemum," was postponed till the next meeting.

### A Proposed Confederation.

The American Horticultural Society has proposed to the various gardeners' societies in the vicinity of New York City that they all combine to hold a great fall exhibition in November next for the "elevation of American horticulture and to benefit the hospitals of New York City." The societies asked to co-operate in the movement were as follows: The New York Gardeners', New Jersey Floricultural, Hempstead, Morris County (N. J.), Monmouth County (N. J.), West Chester, Dutchess County (N. Y.), and Springfield (Mass.) Horticultural.

So far as present reports indicate, the proposal has not met with the approval of these bodies. At a meeting of the Dutchess County Society, the vote went 12 against, with 2 in favor. The New Jersey societies, with one accord, decided to take no action.

### Toronto.

The July meeting of the Horticultural Society was held on Tuesday, the 6th inst., and in spite of the heat it was a good one. Roses was the subject for discussion. The meeting was an open one and many of the public attended. Mr. Uttley, the first vice-president, read a short paper by J. H. Dunlop on the cultivation of tea roses in greenhouses. John Chambers gave a very interesting talk on hardy roses and climbers. He mentioned many varieties of roses as among the best for the country that had been in cultivation for over fifty years. While he highly praised many of the newer kinds, he said that some of these old ones had proved so good and so hardy that we could hardly do without them.

Some good seedling geraniums were on the tables from Mr. Jay and gallardias and delphiniums from Mr. Frost and Mantion Bros. The next meeting will also be an open one and will be devoted mostly to the subject of sweet peas. If the weather be favorable there will be quite a show of these flowers, as Mr. Uttley is an enthusiast in their culture and there are several other good growers among the members.

### Boston.

Patrick Norton has entered on his duties as chairman of the Garden or Visiting Committee of the Massachusetts Horticultural Society. This committee performs an important work and it will be the endeavor of the new chairman to still further increase its usefulness. They have the awarding of the H. H. Hunnewell prizes for the best-laid-out and best-kept estate of not less than three acres, the John A. Lowell prizes for the best houses of chrysanthemums arranged for effect and the society's prizes for the best house of foreign grapes, the best house of chrysanthemums grown on benches, the best house or frame of violets, best carnation house, best fruit garden and the best vegetable garden. All applications for visits must be made in writing to the chairman of the committee at any time during the season.

excepting in the case of the Hunnewell prize, for which entries must be made before August 1.

Saturday, July 10, was hollyhock day with the Massachusetts Horticultural Society, according to the schedule, but owing to the lateness of the season there was but one entry made and the award of the prizes was put off for one week. An interesting exhibition was, however, made without the hollyhocks. J. S. Bailey showed a fine specimen of *Colognyne Massangeana*; James Wheeler, gardener to J. H. White, Esq., made an interesting display of sweet peas, embracing 90 named varieties; William Thatcher, gardener to John L. Gardiner, Esq., exhibited Japanese iris, stocks and poppies; William H. Spooner showed the Bardou Job rose; James Cornley, Rea Brothers and W. N. Craig made displays of cut flowers; Mrs. E. M. Gill and Miss Hattie B. Winter arranged vases of flowers. William Thatcher received honorable mention for a new seedling delphinium.

### Portchester, N. Y.

The first regular meeting of the newly formed Horticultural Society is held this day (Saturday) for the purpose of arranging for a fall show.

## Chrysanthemums.

**Staking** the bench plants should be proceeded with as the plants begin to reach heavenwards. If they can be readily strung to wires running through the house, that will be found to be the best method if the wires be made taut. Three wires for each row will be enough for the season, and then three ties will be sufficient. If wiring be not practicable, wire stakes certainly come next in the order of neatness and they offer no obstruction to the sun's rays as do a forest of bamboos. Whatever is used must be made firm, for the plants must have vigorous syringing to keep them clean, and this cannot be done if the whole thing is loose and liable to fall over.

**Zulinda.**—It seems an outrage to put a stake to this and varieties like it. From a June cutting, this variety, if well grown and the crown bud be taken, will measure more across the flower than the height of the plant from the ground. It is, I think, one of the most handsome foliage varieties grown, and struck the end of April, moved along into an eight-inch pot, pinched once, and three shoots taken up, makes in the fall with its pleasing pink flowers, one of the prettiest plants imaginable.

**The Single Stems** in six-inch pots should be plunged in ashes up to the rim. They are liable to suffer from neglect because they dry out so quickly. Stake them and lay a plentiful mulch of tobacco stems in the pots.

**Caterpillars** seem to be very plentiful this year, and, therefore, need lots of looking after.

**Miss Bramhall** is throwing lots of buds. "Rub out the July bud and take the next" still applies.

**Mrs. Robinson** is making splendid growth. Why do we so often hear that it has a weak neck? C. Totty, N. J.

### Extent of the Nursery Business.

The Census Bureau gives the following interesting figures as to the extent of the nursery business in the United States. The total number of nurseries, 4,510; their value approximates, estimated at the present depressed values, \$41,987,835. The nurseries in the year 1891 occupied 172,806 acres of land valued at from \$15 to \$150 per acre; the capital invested approximates \$54,425,669, furnishing employment to 41,657 men, 4,680 boys fourteen years up, and 2,279 women. This is a remarkably good showing, resulting chiefly from the evolution of less than seventy-five years in this industry.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### White Leghorns as Summer Layers

Those who are fond of belittling the White Leghorn for the benefit of other breeds, point to the white beauties as summer layers only. While it is doubtless true that any other breed would find it difficult to excel them as summer layers, I may say that we have not yet found a breed that will distance them as winter layers. To be sure, we have not tried all breeds, in all climates. But we have tried enough to make us pin our faith more strongly each year to the Leghorn as an all the year round layer. To this end, however, one needs both pullets and hens in the flock.

#### Overstimulation. What Is It?

In the effort to obtain the greatest possible number of eggs in the year, a great difficulty presents itself. An excessive number of eggs can scarcely be produced without forcing. A "balanced ration" for eggs often proves just the ration to unbalance the fowl, as regards her digestive apparatus. The moment this becomes true, it may be known that there has been an overstimulation. And for this, long continued, there is no remedy but the hatchet. The most successful poultry man is he who so balances his feed as to produce first, thrift; after that poultry products of the various sorts which he wishes to sell. For fowls in confinement, the greatest dangers lie in the way of overfeeding heavy grains and meat.

#### Angel's Wings.

According to one catalogue, the owner of the plant rejoicing in this taking name need never speak of angels without seeing the flutter of their wings, inasmuch as it is said to be always in bloom. The plant is rather bright, slightly resembling a Bougainvillea. The individual flowers are of the irregular lobate form, growing singly in the axils of the leaves. They are of a rather dull crimson in color. With only here and there a bloom, the plant is not particularly showy. But if well covered with bloom, it may prove quite attractive, especially in winter, when red blossoms brighten up the window so much. Its more stately name is *Beloperone*.

#### Classifying Plants as to Care.

It needs only a few rules to grow nearly all plants, if we can mentally place each one in a class with many others. There are the hard wooded, and the soft wooded, each class requiring different treatment; there are the heat lovers, and those which refuse to thrive except in a cool temperature; there are sun lovers, and shade lovers; there are moisture lovers, and those which have no delight except in drought. Most of the hard wooded plants require somewhat similar treatment. By learning this, by placing the sun lovers in the south windows, the shade lovers in an appropriate place, and by making certain that the plants which delight in moisture shall have plenty of it, the plant problems are mainly solved in a general way.

#### Using Manure Water.

If there is ever a time when it is safe to use manure water it is when there is warm and fairly equable temperature and a full supply of fresh air, as during the summer season. This applies to plants that are in good growing condition, as it would seem that good common sense should teach us not to stimulate plants that desire to rest. Plants that really want to grow can take light doses of manure water now to very good advantage. Try it on the *Aspidistra*, the *Jasmines*, etc.

#### Trimming Back Fuchsias.

Plants intended for winter bloom have been resting for some time. When well into August they should be cut back severely, and removed from the pots. After the soil has been washed from the roots, and the roots slightly trimmed,

## HOUSE PLANTS

AND  
HOW TO SUCCEED WITH THEM.  
BY

LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when noting with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to be far beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"HOUSE PLANTS" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "House Plants" will take its position second only to the much prized and ever handy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fail.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done, if my instructions are followed."

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. Those silent monitors, the flowers, are not dumb, but speak to us through the delicacy of their accents, their intricate shapes, complex habits, and the glorious penciling of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

they are to be repotted into rather small pots, at first, in fresh rich earth, loamy and friable. After one good settling of the soil, water is to be given but sparingly until growth begins. The pots can be prevented from drying out by avoidance of exposure to sun and wind.

#### Lean Pullets for Layers.

Again and again is the warning given that the fat hen is not the profitable layer. As a pullet nears maturity, it is an easy matter to fatten her by injudicious feeding, and the over-fat pullet is not the early-laying pullet. At the beginning is, after all, the best place to begin. Plenty of nitrogenous and bone-forming foods all the season, to build up the well-bodied but lean layer. Plenty of corn and meal all the season to raise the fine-carcassed cockerel for the block. Plenty of care all through the season as to feed and feathers, cleanliness and tameness, and room to develop, for the exhibition stock. Whatever we are aiming at, let us not wait until it is full time to hit the mark before we take aim, especially at long range.

#### The Hen as a Machine.

People are fond of referring to the hen as a machine into whose figurative hopper we turn certain kinds of grains and grits and green provender, and grind out eggs as a matter of course. Measurably, this is true but the hen differs from the machine in that her likings and appetites must always be considered. There are some things that she will not eat, no matter how good her owner may believe them to be for her. Many things she may be taught to eat; but if, after painstaking in this line she still refuse certain rations, it is safe to conclude that they are not suited to her then condition. The common "stupid" hen is usually intelligent enough to know what is for her harm.

#### "The Best Dozen Eggs"

Which is really best, the white egg or the brown; the large egg, or that of medium size? There is much argument in the poultry papers of late, trying to prove that the birds which lay the "best dozens" at the shows, are really the best utility birds. If the judging were based on uniformity of color and uniformity of size, just far enough above the average that the breed could be held up to it, the point might be considered proven. But too often the eggs are over-sized (double yolked, perhaps), merely because the hens are out of condition, too fat, or otherwise. Looked at from the producer's standpoint, the frequent over-sized egg is not desirable. It costs more to produce, it injures the sale of the average, and as a rule, it brings him no more money. Nevertheless, the breed that always lays good-sized eggs—if there are enough of them—is a good breed to have. The consumer likes such eggs.

#### Success With Oleanders.

Failure in blooming this old favorite results frequently from one or both of two causes. One of these is the lack of abundance of water during growth. The other consists in failure to afford sufficient light and warmth. It is this lack which causes the buds to refuse to leave the partially-developed stage in which they so often stand for many weeks. Plenty of light, plenty of water during growth, plenty of sunshine and air later to make short-jointed, well-ripened wood for next season's work are the points which make for success.

MYRA V. NORRIS.

## DWYER'S SUMMER and AUTUMN LIST

Of Pot Grown and Layer STRAWBERRY Plants, CELERY, VEGETABLE Plants, FRUIT Trees and ALL NURSERY STOCK will be mailed free to all who apply for it.

## WHOLESALE MARKETS.

### New York.

The shipments of all kinds of cut flowers have fallen off considerably, and but little stock is now to be seen. Roses have become very scarce; Sweet Peas are nearly over. The new crop now in is Asters, these are getting to be very plentiful, and so far are selling at \$1 per dozen bunches.

Fruits and vegetables are plentiful and clear fairly well; prices are weakening slightly. Peaches are now the main feature in the way of fruit, receipts having increased and the quality has improved, but even now there is a large proportion of inferior fruit, much of it bearing evidence of having been stung by the curculio, and a large proportion of the fruit has evidently been gathered from the ground. A word of advice to Georgia shippers is, don't ship such stuff.

Prime, highly-colored, even-sized Elbertas from that above section are making occasionally as high as \$3 per crate of nine baskets, each basket weighing on an average 3½ pounds and containing 9-12 fruits. A large proportion of the crates shipped contain only six baskets and some dealers contend that they are the heavier when so packed; but as far as our observation goes, the highest figures were obtained for the first-named style of packing.

E. I. Carter of Richland, sent in three carloads of fine quality in good condition which were sold at figures varying from \$2.50@ \$2.75 and a few \$3.

Hothouse grapes are very abundant and sales are slow; 50c. per pound is top notch.

Hothouse tomatoes still continue to move freely, owing to the unripe and poor condition of the outdoor grown stock; 12c., 15c., and 20c. per pound are taking prices.

Potatoes are holding firm at \$2.25@ \$2.50.

Apples—Near-by, hand-picked, per barrel, \$2@ \$2.50; near-by, windfall, per barrel, 75c.@ \$1.50; Virginia, per barrel, \$1 @ \$2.50; Maryland and Delaware, good to prime, per crate, 60c.@ 90c.; common, per crate, 80c.@ 50c.

Peaches—Southern, express, fancy, per carrier, \$2.50@ 3; freight or express, good to cheap, \$1.25@ 2.25; poor to fair, per carrier, 75c.@ \$1; Maryland and Delaware, early, per crate, 75c.@ \$1.25; early, per basket, 50c.@ \$1; Jersey, early, per basket, 50c.@ 75c.

Pears—Le Conte, medium to fancy, per barrel, \$2@ \$3.

Grapes—S. C. Moore's Early, per 25-pound case, \$2.

Plums—Wild Goose, per quart, 4c.@ 5c.

Cherries—Sweet, per pound, 3c.@ 7c.; sour, per pound, 3c.@ 4c.; eight-pound baskets, as to size and condition, 20c.@ 40c.

Currants—Large, red, per quart, 2c.@ 4c.; bulk stock, per pound, 2c.@ 3c.

Blackberries—Monmouth Co., Jersey, Wilson, per quart, 5@ 6c.; Jersey, Kittatiny, per quart, 4@ 5c.; South Jersey, cultivated, per quart, 4@ 6c.; Maryland and Delaware, cultivated, per quart, 3@ 5c.; small and inferior, 2@ 3c.

Huckleberries—Shawangunk Mountains, per quart, 6@ 8c.; Pocono Mountains, per quart, 6@ 7c.; other Pennsylvania, blue, per quart, 6@ 7c.; Pennsylvania, per eight-quart basket, 40@ 50c.; Jersey, per quart, 5@ 6c.; Delaware and Maryland, per quart, 4c.@ 5c.

Raspberries—Upriver, red, per pint, 3@ 5c.; per three-to-four cup, 2@ 4c.; four-to-four cup, 2@ 3c.; Upper Jersey, red, per pint, 2@ 4c.; Jersey, red, per pint, 2@ 3½c.; Blackcap, up-river, per pint, 2@ 4c.; Jersey, per pint, 2@ 3c.; western New York, per quart, 3@ 5c.

Melons—Watermelons, by rail, per car, \$125@ \$275; by steamer, per car, \$100@ \$200; medium to large, per 100, \$20@ \$30; small, per 100, \$10@ \$15; muskmelons, Gem or Jenny Lind, fancy, per bushel basket, \$2 @ \$2.50; choice, per bushel basket, \$1.25@ \$1.50; poor to fair, per basket 50c.@ \$1; per barrel, or barrel crate, \$1 @ \$2.50.

Corn—Jersey, per 100, 60@ 75c.; North Carolina, per 100, 50@ 75c.

Cabbages—Jersey and Long Island, per 100, \$3@ \$4.

Cucumbers—Jersey, per bushel box, 50 @ 65c.; Philadelphia, per one-half barrel basket, 60@ 75c.; Norfolk, per barrel, \$1 @ \$1.50; Norfolk, per basket, 40@ 50c.

Egg plants—Florida, per basket, 50c.@ \$1; Jersey, per bushel box, \$1 @ \$1.25.

Lima beans—Maryland, per one-half barrel basket, \$3@ 3.50.

Onions—Maryland, per one-half barrel basket, 70@ 80c.; eastern shore, per one-half barrel basket, 60@ 75c.; North Caro-

(Continued on next page.)

### Beware of Ointments for Catarrh that Contain Mercury.

as mercury will surely destroy the sense of smell and completely derange the whole system when entering it through the mucous surfaces. Such articles should never be used except on prescriptions from reputable physicians, as the damage they will do is ten fold to the good you can possibly derive from them. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, O. contains no mercury, and is taken internally, acting directly upon the blood and mucous surfaces of the system. In buying Hall's Catarrh Cure be sure you get the genuine. It is taken internally and is made in Toledo, Ohio, by F. J. Cheney & Co. Testimonials free.

Sold by Druggists, price 75c. per bottle.

### Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticultural Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Peppers—South Jersey, per crate, 60@ 75c.  
String beans—Long Island, per bag, \$1 @ \$1.25.  
Squash—Marrow, per barrel crate, 75c. @ \$1.25; yellow crook-neck, per barrel, 50 @ 75c.; white, per barrel crate, 50@75c.  
Tomatoes—Monmouth Co., Jersey, per crate, 75c.@ \$1.25; south Jersey, per crate, 50@75c.; Norfolk, per carrier, 75c. @ \$1.50.  
Turnips—White, per 100 bunches, \$1@ \$1.50; Russia, per barrel, 50@75c.

### Philadelphia.

Business has been very good in this market during the past week; all kinds of stock have been selling freely. Most of the business has been done at the freight depots, there being but very little stock at the warehouses.

Apples—Maryland and Delaware, per bushel crate, 60c. to 75c.; Jersey, wind-fall, per barrel, 75c. to \$1.

Raspberries—Jersey, red, per pint, 2c. to 3c.; blackcaps, per pint, 2½c. to 3½c.

Gooseberries—Pennsylvania, Industry, per quart, 5c. to 6c.; small, per quart, 3c. to 4c.

Huckleberries—Jersey, per quart, 5c. to 7c.; Pennsylvania, per quart, 7c. to 8c.

Blackberries—Maryland and Delaware, cultivated, per quart, 4c. to 6c.; Jersey, 3c. to 5c. per quart.

Currants—Large red are being offered mostly in bulk at from 2½c. to 4c. per pound.

Cherries—Sweet, per pound, 4c. to 5c.; sour, per pound, 3c. to 4c.

Melons—Watermelons are much more plentiful, and are moving very well; choice stock is selling at \$20 to \$25 per 100; fair to good, \$10 to \$20. Muskmelons, fancy, per one-third barrel basket, \$1.40 to \$1.75; fair to good, 75c. to \$1.25.

Peaches—Georgia, fancy, \$2.50 to \$3.50 per crate, and selling very fast at these prices.

Pears—Le Conte, fancy, \$3.75 to \$4.25 per barrel; fair to good, \$2.50 to \$3; per basket 55c. to \$1. There are arriving in much better condition and are selling well; in fact, one firm on Monday sold an entire carload to jobbers, at the freight depot, demand being so strong.

Corn—Jersey, per 100, 60c. to 75c.; selling slow.

# Potash

is one of the three important ingredients of a complete fertilizer; the others are phosphoric acid and nitrogen. Too little Potash is sure to result in a partial crop failure.

## Free

An illustrated book which tells what Potash is, how it should be used, and how much Potash a well-balanced fertilizer should contain, is sent free to all applicants. Send your address.

GERMAN KALI WORKS, 93 Nassau St., New York.

Another American gardening when you write.

Cabbages—Jersey, per 100, \$2.00 to \$2.50; per basket, 15c. to 20c.

Cucumbers—Jersey, per five-eighths basket, 30c. to 35c.; Norfolk, per barrel, \$1.25 to \$1.60.

Egg Plants—Jersey, per basket, 80c. to \$1; Florida, per one-half barrel box, \$1 to \$1.40.

Onions—Jersey, per five-eighths basket, 35c. to 45c.; per barrel, \$1.75 to \$2; Maryland, per one-half barrel box 75c. to \$1.

### Boston.

The new apples from Virginia, Maryland, and New Jersey are in various conditions. Some West Virginia Early Harvests (so-called) selling \$2.75; Jersey Red Astrichans, \$2.75; Sour Bough, 2.50@ \$2.75; common stock from around Norfolk, 50c.@ \$1 per half-barrel basket.

South Carolina Delaware grapes just appearing, bringing \$3.50@ \$4.50 per seven-basket carrier. Moore's Early \$2 per carrier; hothouse Hamburgs, 70c.@ 80c. per pound.

A few old apples to be found; they bring \$2@ \$3.50, and are mostly Russets or Ben Davis.

Very good demand for pears; best Le Conte, \$3 per barrel.

Pineapples doing better; the surplus stock cleaned up, and the second pickings coming to the front, consequently the market sees a large quantity of small pines which have to go to canning trade.

The only strawberries arriving are those from Nova Scotia, they can be quoted 6c.@12c. Raspberries not as plenty, 4c.@5c. for thirds. Blackberries fairly plenty with an easy market,

8c.@10c. generally, with choice fancy wanted at 12c.@14c.

Blueberries in good demand, 13c.@15c. per quart.

Currants are in excellent condition, never better, but find hard sales at 5c. @6c. per quart.

Gooseberries, Hudson River, 4c.@6c. a quart; Nova Scotia, 40c.@50c., peck boxes.

Tomatoes are firm and it is many years since they sold so high; Virginia stock, \$1.50 a bushel; hothouse, 15c. a pound; Jersey, 90c.@ \$1 a box supposed to hold 22 quarts.

Potatoes are firmer, market keeps well sold up, best Eastern Shores Jerseys, or Bristol Ferry's, \$2.75@ \$3 per barrel; Virginia getting about dug out.

Onions steadier, barrel stock, Virginia or Kentucky, \$2.25@ \$2.50.

Watermelons plentier and lower, 20c.@ 25c., according to size.

Cabbages, near-by, 4c. a head.

Marrow squash, high colored, \$1.50@ \$1.75; pale, 75c. a barrel.

Peas, 30c.@50c. a bushel.

Cucumbers \$1.50@ \$2 per 100. Home-grown stock all that comes at present.

Lettuce, short; brings 20c. a dozen.

String beans, green, 35c.@40c. a bushel; wax, 35c.@40c.

Beets, 30c. a bushel; turnips, 50c. a bushel.

A large quantity of home-grown vegetables, if we except tomatoes and onions.

Asparagus, no demand, neither is there any call for corn; cantaloupes, if fancy, \$2.50@ \$3; common stock, \$1@ \$1.50.

Peppers unchanged; also mint; summer squash and egg plant.

The few mushrooms wanted bring 70c. a pound.

TO BE PUBLISHED AUGUST 10.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

THIS volume, which has been prepared by the foremost aquaticulturist of the country, and to whose efforts the present growing popularity of the Water Garden is largely due, is designed to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The book will be freely illustrated with plates and illustrations in the text, and will describe all operations, from the growing of plants in tubs to construction of the large pond, planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

Box 1697, New York.

**Green Fly and Ants on Trees.**

A plum tree, three years from the nursery, has not as yet borne fruit. Early this summer it was badly infested by green fly and ants. We sprayed with Bordeaux and Paris green, and London purple, and also broke off the tips of the new growths which were most attacked. This did no good and now the tree has lost all its leaves. Is it likely to die? What connection exists between the green fly and the ants.—C. A. L.

—There is no reason why the tree should die from this year's bad progress. It was a pity you wasted energy in giving the sprayings mentioned, because you used wrong substances for green fly; the creature sucks and poisons on the leaves do not touch it, the proper thing is kerosene emulsion so directed as to cover all parts of the plant and of the lice too. Take good care of the tree, do not let it starve and all will come out right. The ants and lice have a peculiar relationship in that the former exploit the latter for food purposes; they actually use them as we do cows.

**Rust of Verbena.**

Is it possible to stop the rust disease of Verbenas? I have a large bed of the plants, they are all growing vigorously, but every day I lose one or two plants. Have used slaked lime, but with no results. The bed has been planted to Verbenas several times already.—L. D. E.

—Guided by the experience of one of the largest growers in the country, there is no real cure for the trouble other than that of burning the plants, destroying also any varieties that show a marked tendency to become diseased. On the other hand, several remedies are held up as sure cures by other growers. Sulphide of potassium and Bordeaux mixture are recommended. Possibly a change of soil with early and frequent sprayings may help you.

**Bagging of Grapes.**

(To C. A. L. and others.)—Grapes are "bagged," that is, the bunches are tied in ordinary grocery bags, made of paper, in order to preserve their color and finish and the ripe fruit is certainly greatly improved thereby. The bagging affords protection from insect attacks, too, and especially of wasps. As soon as the "set" is sure, the bags may be put on, gathering the neck around the stalk and tying it securely. A small hole may be made in the bottom to allow escape of moisture. The bags are removed when the grapes are to be gathered.

**THE BEST HANDY MICROSCOPE FOR THE FLORIST!**  
...A CODDINGTON MAGNIFIER...

The applications of science to practical horticulture are to-day so numerous as to need no pleading for recognition, and the cultivator who is alive to facts knows that disease can be fought most thoroughly, and with the minimum of labor, only by going to its inception—in short the battle must be declared just so soon as the disease has a foothold. Continual alertness is the only safeguard, and a grower should be in a position to at once thoroughly and minutely examine into all suspicious marks or spots and not wait until the manifestation was all too evident.

All things have small beginnings, and in order to detect disease, artificial aid is frequently a necessity, thus all should carry a convenient

**...POCKET MICROSCOPE...**

to examine suspected cases of fungus or insect pests at once.

Nothing can be better adapted for this purpose than a Coddington Lens, suitably mounted. This lens is solid, and thus not affected by change of temperature, consequently admirably adapted for the purposes for which we offer it.

The accompanying illustration represents a lens, mounted in German Silver, which we offer at \$2.50 each; they can be had in various powers, from a one-half to a two-inch focus, but for all general purposes (and the one we use ourselves,) the most adaptable is that known as a one-inch focus. It gives a magnification of 10 diameters, and is more easy to work with as it allows a greater distance from the lens to the object than does a lens of higher power; by this means a better light can be brought to bear on the object, and also the field of view is not so restricted.

We will mail this Coddington Magnifier, of the best possible construction, and made with great care throughout, one-inch focus recommended, with a power of ten diameters, for \$2.50 cash with order. If instrument is not satisfactory purchase price will be refunded if instrument is promptly returned in good order.

We can also supply a very effective pocket magnifier, half-inch focus, flat field, at the low price of \$1.25, postpaid. Address all orders to

A. T. DE LA MARE PTG. & PUB. CO. Ltd., P. O. Box 1697, NEW YORK.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is an index of our subscribers' interest in the paper.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call to push circulation. Understanding thoroughly the value of the paper to every one interested in gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER PREMIUMS SUMMER

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us AT LEAST one new subscriber before the close of the season.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only seven new subscriptions at \$1.00 each.

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Beautifying Country Homes.** By J. WEIDEMANN. A handbook of landscape gardening. This is the most elegant and useful work on the subject ever issued in this country. It is beautifully illustrated with numerous fine wood engravings, and with 17 full-page and 7 double-page colored lithographs of places already improved. It contains general directions for lawns, roads and drives, walks, hedges, trees and shrubs, gardens, ornamental grounds, hints on burial lots, etc., etc. The beautifully colored plans of improved places are accompanied by descriptions giving the names and positions of the various trees and shrubs employed in planting, thus providing a complete planting map. Cloth, 4to. Reduced from \$15.00 to \$10.00.

*Given for 20 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. Handsomely illustrated, cloth, 12mo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Canning and Preserving Fruits and Vegetables, and Preparing Fruit Pastes and Syrups.** By ERMERTINE YOUNG. This work gives a full account of the best methods by which the surplus fruits may well be saved for home use and for the large market demand, and a handsome profit accrues

to the home workers. A practical chapter on evaporation of fruits is embodied in the book. Paper, 20 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases, dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo., cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit and Fruit Trees of America,** or the culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. By A. J. DOWNING. Second revision and correction, with large additions. By CHARLES DOWNING. This work has no equal in the country, and deserves a place in the library of every pomologist. It gives descriptions of all the finest varieties of fruit, native and foreign, cultivated in America, and contains the names and synonyms of over 10,000 varieties. Over 1100 pp., with several hundred outline engravings, including supplements. 8vo., cloth. \$5.00.

*Given for 12 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

# A YARD OF ROSES.

Copyright, 1896, by O. D. Gray, New York.

The illustration but faintly represents the beauty of this celebrated painting by the well-known artist, Mr. Newton A. Wells. The grouping and coloring has been performed with exquisite taste, and the reproduction we offer is worthy a frame, and a position on the wall of any one's room. This sketch, in eleven colors, is 36 inches long and ten inches wide, on heavy drawing paper, and sells in the art stores of New York for fifty cents. We will send "A Yard of Roses," securely packed in a tube to prevent injury, postpaid, as follows:

To all renewing their subscription and adding five cents to pay postage and packing.

To all sending us \$1.00 for their own renewal subscription and 75 cents for the subscription of a friend, we will send "A Yard of Roses" free and postpaid, as a premium to both addresses.

## Fall Setting of Strawberries.

R. M. KELLOGG, Three Rivers, Mich.

It's a mistake for the commercial grower. I concede you can get quite a good many fine berries, but you can't make any money out of it.

If I could not get berries for my own table I would be willing to buy potted plants, pay big express charges and all that rather than deprive myself and family of an abundant supply of berries; I would set them any time I could; but for a commercial grower to plant early vegetables and then buy potted plants at the price he must pay for them and set his beds the last of July or first of August is "fiddling for time."

There is no money in it for the ordinary grower—not one in a thousand gets a full crop, and that one would have to have ideal conditions including an extra rich soil, with irrigation facilities and give the plants extra culture. If the fall was very wet or ground naturally moist and mellow, he might partially succeed.

The last six years have given us but one reasonably wet fall and we are likely to have a repetition of this shortage of rain during the months of August, September, and October.

Of course much depends on what you mean by "a crop." If it be 40 to 75 bushels, that's all right; it can be had, but such a crop does not pay any one.

My idea of commercial strawberry growing,—and I have followed it for a respectable lifetime—is to grow only strictly first-class fruit, build up a reputation and secure a permanent hold on the market. I want every plant laden with immense berries, rich in flavor, sound to the core, and a texture so firm that the fruit can be shipped anywhere. To produce this I want my ground very rich, especially in potash and phosphoric acid, with plenty of partially decayed vegetable matter or humus. I want to set my plants early in the

spring while they are entirely dormant, so new lateral roots will start in great abundance. I would set them with the cone maker so that the roots shall come near the surface to get the sun's rays at once.

I then want the blossom buds removed, before open to secrete pollen. I am a stickler for pedigree in plants just as much as any stock breeder is for pedigree in stock. A plant that has been allowed to shed its pollen to exhaustion, or has been previously taken from an old bed, and is therefore incapable of breeding (fruiting) cannot occupy my land or receive my care. I want a plant thoroughbred in every sense of the word.

Then the runners must be kept off so the plant shall build up massive crowns and send its roots away down deep and far out, giving it abundant resources by which, without exhaustion, it can bring its immense berries to the fullest perfection. The plant must be isolated so the sun can shine on its crown as well as on every leaf. It must be cultivated frequently all summer.

I have such plants set this spring and at this writing (July 19), you can't put a half-bushel over them without doubling up the leaves.

Now I would like to see some one set potted plants by the side of these and get enough berries (including this previous crop of early vegetables) to buy the berries that will grow on my plants, assuming we have reasonable climatic conditions.

No one could or should expect a large crop of berries until he has grown large plants. It requires three or four weeks for plants to get established, and the fall months are not enough for them to make a proper growth.

To the commercial grower who has grown his early vegetables, let me now urge the sowing of crimson clover or cow peas. Apply all the manure that can be had during the fall and winter and set the strawberry plants next spring.

FIG. 148.—ANTHRACNOSE OF SYCAMORE TREES. DISEASED AND HEALTHY TREES.  
(See page 538.)

## Sweet Pea Novelties for 1897.

The science and art of the culture and nomenclature of the sweet pea have assumed great proportions, and many men of well-equipped faculties make a study of this popular flower, to which I ascribe the fact that it has far outstripped all others in the extent of its culture, and the hold it has upon the affections of its votaries.

It is customary for the houses making a specialty of the sweet pea, to introduce a half-dozen or so of novelties, so called, to the public, many of which have no merit, while some are merely changes rung on the old, and nearly forgotten varieties. It is the province of the sweet pea expert to test these various novelties, and give their points, good, or bad, to those who depend upon them for expert advice.

I give below my tests of some of the novelties of this year, as well as some advance work of the specialists.

ECKFORD'S 1897 SET. (Eng. introduction.)

QUEEN VICTORIA.—This is decidedly the best of this set. Eckford describes it as "soft yellow, subtly overlaid with faint purple," but no American specialist, so far as I know, has detected the purple in it. My "Chro-mometer" shows it to be a light lemon self. My test of it shows it to be: Form, expanded; size, medium; color, light lemon self; substance, fair; stem, long and slender. It has a slight, tight roll to the edge of the standard, which detracts, apparently, from its size. It is the nearest approach to that goal to which all specialists are striving—a real yellow sweet pea.

PRINCE EDWARD OF YORK.—There is nothing particularly fine about this sweet pea, and it is surprising that Eckford should have introduced it. It proves to me what I have been suspecting for some time, that he is putting out unfinished work, no doubt owing to his advanced age. While it is large, yet it is old style, and not up to his usual work. It tests as follows: Form, expanded, deep notch at top; size, large; color, standard dark cherry (Eckford gives it scarlet); substance, good; stem, medium.

LADY NINA BALFOUR.—This sweet pea has had the poorest average of germination of any Eckford ever introduced. I have two plants out of forty seeds, but neither of them is likely to bloom. Others report the same difficulty.

COUNTESS OF POWIS.—This is a good sweet pea, and a new shade. Eckford describes it "as a glowing orange, suffused light purple," but I make it as given below. It is very attractive, and will be welcomed as an acquisition. It tests: Form, expanded; size, large; color, standard shrimp, veined salmon; wings, salmon-pink. It has the real satin finish. Substance, good; stem, long and slender.

TRIUMPH.—This has the most perfect form of any of the set; it is a giant, and without a flaw as to everything but color, which contains nothing new, except as to arrangement. This will be a good flower to cross on, as the size and form are already there. It tests: Form, expanded; perfect type; size, giant; color, standard dark salmon-pink; wings, white, veined, dark rose (Eckford gives it "standard, orange-pink; wings white, slightly flushed with delicate purple.")

SALOPIAN.—From the advance description, we were led to believe that this would be the greatest acquisition to the list of sweet peas ever made, but we were never so badly disappointed. It throws over 50 per cent. of the obsolete *Butterfly* form (deep scallops at each side), and the color is not at all what Eckford described. One of the most desired colors in sweet peas is a true crimson, and we were assured we had it in Salopian. Note Eckford's description of the color: "Deep crimson, tinged with mulberry-red, suffused with rich orange-scarlet." Now note what it really is, as per test: Form, expanded; size, giant; color, dark cherry self; substance, good; stem, short and stocky. The worst feature about Salopian is that it generally comes three to a stem, and the first to open blackens before the second is out, and is seedling by the time the third is out. It is a hard matter to get a perfect spray.

SHAHZADA.—This has the same percentage of *Butterfly* form as the last, but in other respects is a fine flower, the large expanded forms being beauties. It is free from the objectionable gloss present in Monarch and Stanley. It tests: Form, expanded; large size; color, very dark maroon, streaked dark garnet standards; wings, light plum, streaked dark garnet; substance, fine; stem, medium. A great advance in the darks, after the American specialists have selected it up.

Taken all in all, the above set is a disappointment, as not being up to Eckford's standard.

ECKFORD'S 1897 SET. (American trade.)

This is one of the finest Eckford ever introduced.

COQUETTE.—Has the same objection as to form as Shahzada, but comes a larger percent. true. It has a shade of true yellow in it, which, if it could be "selfed," would be what we all desire. It tests: Form, expanded, with rolled edge; size, large; color, light yellow, suffused pinkish purple; substance, fine; stem, long and stocky; flowers all face one way.

LOVELY.—Is just what it's name indicates, a most lovely flower, its only fault being its liability to bleach whiter, if not promptly cut. None of the pinks has the same beautiful appearance on the vine. It tests: Form, finest hooded; size, giant; color, medium pink center, with wide margin of light pink; substance, fine; stem, very long.

MARS.—There seems to be a diversity of opinion in regard to this sweet pea. Of its form Eckford says, "a fine large, finely-expanded bold flower of the most beautiful form." Hutchins says of its form, "full size and hooded shape." I have found it to be hooded, with about 50 per cent. of the obsolete *Butterfly* form. Of its color there is equal diversity of opinion. Eckford says "bright, fiery crimson, deepening with age." Hutchins says "intense crimson-scarlet." As there are no crimson or scarlet sweet peas, I cannot agree with the above, as the Chro-mometer shows it to be a dark cherry self. It tests: Form, hooded; size, large; color, dark cherry self; substance, good; stem, long and slender.

COUNTESS OF SHREWSBURY.—This sweet pea should never have been introduced by such a specialist as Eckford. It is old type, and is off color, and has not an attractive point about it, excepting its graceful slender stems. It is simply a washed-out "Little Dorrit." It tests: Form, expanded old type, with notch at top; size, medium; color, standard white, suffused light rose; wings, white; stem, long and slender; fair substance.

PRIMA DONNA.—This is all that Eckford claims for it, excepting that it comes of two shades, one resembling Crown Jewel. The typical flower throws mostly fours, all facing one way. It is of the highest type, and worthy of its introducer, and will have a long run as a favorite. It tests: Hooded, finest form; size, large; color, medium pink self; substance, fine; stem, long and stocky.

ROYAL ROSE.—This is a most beautiful and high-bred flower, and should prevent the introduction of any lower class sweet pea from Eckford's workshop, as showing what he can do. It attracts the attention of every one, and with me was the largest sweet pea. It tests: Form, expanded; size, mammoth; color, standard dark violet-rose; wings, light rose, suffused on white; substance, fine; stem, long and slender.

BURPEE'S 1897 SET.

While all sweet pea lovers will ever revere the name of Henry Eckford, as the pioneer in its advancement, yet justice compels one to say that the American hybridizers have caught up with, and passed him in the art of producing new and beautiful sweet peas; of course they adopted his methods, but with the usual Yankee ingenuity they have improved upon them. Sweet peas equal to the first two named below were never put out by Eckford.

AURORA.—This is the most beautiful sweet pea of the year, and a new shade. We have had many so-called salmon

shades in sweet peas, but Aurora is the first one that has the true shade. It is of the highest grandiflora type, and is destined to have a permanent place on the list; no variety bunches as well as Aurora. It tests: Form, finest expanded; size, mammoth; color, dark salmon, striped on white; substance, fine; stem, long and stocky.

AMERICAN SEEDLINGS.—This is the most remarkable strain of sweet peas ever produced, both from the manner of their production and being all the results of hybridizing, and not the selection of "sports." These seedlings run the gamut of colors and shades, excepting those known as dark. In them we have a true orange, and light yellow, a buff with pink edge, and a violet-edged white, of grandiflora size and form, being a perfected *Butterfly*. Some are of expanded and some of hooded form, of the finest types. They test: Size, large; substance, fine; stem, long and slender.

BRILLIANT.—While this sweet pea is not as large as Salopian, yet it is far superior to it, in that it does not blacken in the sun. By this is not meant that if left to die on the stalk it will not turn black. It means that all will keep their color equally well, and fade together. It is somewhat irregular in outline, some of the blooms showing the peculiarities of Oddity. I have not yet been able to locate its color, but it is an intense fiery shade of red, the exact shade of which will no doubt be a matter of much discussion. It tests: Form, expanded; size, medium to large; color, unknown; substance, fine; stem, very long—a typical stem for a sweet pea.

BURPEE'S NEW COUNTESS.—This is an object lesson in the art of selection. It is a selection from the old Countess of Radnor, which has been considered off color on account of the standard showing a shade of cherry, which disharmonizes with the lavender associated with it. Some years ago a typical plant was selected, and the type rigidly adhered to, and the result is one of the most beautiful sweet peas grown. It tests: Form, hooded, finest type; size, large; color, standard dark lavender, edged light lavender; wings, pearl lavender; substance, fine; stem, long and stocky.

CREOLE.—This is a decided acquisition, being a soft pink fused with light lavender on the standard, and a pure dark lavender on the wings. Being the only instance of the expanded form, it forms a pleasant contrast to others of the same shade, all of which are hooded. It tests: Form, expanded; size, large; color, as above; substance, fine; stem, long and stocky.

GOLDEN GATE.—This is noted for the peculiar shape of its wings as well as its dainty coloring. The wings, when true, stand parallel, like gate-posts, suggesting the name. It is very floriferous. It tests: Form, bizarre; size, large; color, standard light cherry-violet; wings, pansy-violet; substance, good; stem, long and slender.

MAID OF HONOR.—This is a selection and improvement on the old *Butterfly*, the form of which is now considered obsolete. It comes very true to type, and will be one of the best florist's sweet peas for cut blooms. It tests: Form, expanded; size, large; color, white ground, edged English violet, suffused rosy violet; substance, good; stem, long and slender.

UNNAMED CALIFORNIA SEEDLING.—This is a most striking sweet pea, being the darkest of the so-called "mauve" color. It looks very much as though the originator was working for a self of this shade. The introducers offer a prize for the most appropriate name for it. It tests: Form, hooded; size, medium; color, white ground "flushed," pansy-violet, "blotched," crimson-mauve; shades deeper on reverse; standard and wings edged pansy-violet.

WALKER'S OREGON SEEDLINGS.

These novelties sent me by Mr. S. T. Walker of Forest Grove, Oregon, who is coming into prominence as a hybridizer of sweet peas, are a fine set. They contain something new in sweet peas, and when selected up to the highest standard will obtain a permanent place on the

list. They show the most intelligent manner of crossing, and give us an idea what to expect from Mr. Walker in the future.

**DARK MAROON STRIPE** (a sport from Dorothy Tennant.)

**PALE MAUVE STRIPE** (a sport from Dorothy Tennant.)

These two are very fine dark stripes, but require severe selection, as there is too much variance to call them set. I think that the lighter forms of both of them should be selected. They test: Size, large; form, hooded; substance, good; stem, medium.

**SPORT FROM COUNTESS OF ABERDEEN** (stray from Eckford sealed packet.)—This is the finest of Walker's novelties, being a most unique shade of soft invisible pink, showing deeper in the shade. I would not be surprised to know that Eckford has this in reserve. It does not fade white as the florets age, as do most pale pinks. It tests: Form, hooded; size, large; color, as above; substance, fine; stem, long and slender. It is most chaste in large bunches.

**SPORT FROM CAPTIVATION.** "STRIPED CAPTIVATION."—This is not a Captivation, but is of a lighter shade, being the striped form of light self from Captivation, which I have in my collection. It is a very pleasing shade, but needs selecting or uniformity of shade, dark or light. It tests: Form, expanded; size, large; co-

well set should be introduced to the public. It tests: Form, finest hooded; size, large; color, white, waved dark ox-blood, faint on front, and dark on reverse of standard and wings—the so-called "waved" effect. Substance, fine; stem, long and slender.

**MEDIUM FLAMBEAU; LIGHT FLAMBEAU.**—Of lighter shades than the former, and of poorer quality. Will never be so attractive. Needs selection to a set type.

**BLANCHE BURPEE, THREE TO STEM FIRST FLOWERS; BLANCHE BURPEE, SECOND AND THIRD CROP OF FLOWERS.**—These selections of this white sweet pea showed no perceptible difference, excepting that some of the florets of the latter were possibly slightly larger than the former. This is the finest strain of Blanche Burpee that I have ever seen, being well selected, and thoroughly bred. The florets averaged an inch and three-quarters across the standard, many measuring scant two inches. They truly are mammoth, and show the possibility of this variety in the hands of a skillful floriculturist. We will yet see standards of this variety two and a half inches across—if Walker keeps at it.

**VENUS** (test as to Venus losing its color).—This is a fine selection of Venus, which comes mostly in fours, but I have not found any loss of color in the Venus furnished me.

tests: Form, expanded; size, giant; color, a blue Princess of Wales; substance, good; stem, medium stocky.

**STRIPED CELESTIAL.**—Is a high-grade flower, but is just one season too late, being almost identical with Juanita. The color fades as the flower ripens, which Juanita does not. It tests: Form, expanded; size, large; color, white, striped English violet; substance, good; stem, medium stocky.

**RED RIDING HOOD.**—This variety grows upon one. Like some other good things one must acquire a taste for them. It has been universally admired in my garden this year, and it is an exponent of the highest type of the art of selection. It is a matter of patience in many cases to select a color or shade, but to select up a freak of nature is genius, pure and simple. It is extremely fragrant, and has the typical stem, long and slender, but strong. The wings are the deepest rose, while the abortive standard is a transparent cream fused light rose. Could this be selected to a pure white standard, it would enhance its beauty. It should have a place in every collection.

**EMILY LYNCH.**—I had an unusual experience with this variety, or rather with four vines of it. While my rows were about four inches high, I noticed that these four vines were shooting up at an amazing pace. I made careful notes of their progress and they came into bloom in sixty-three days from planting the seed. There is nothing in the history of this variety to indicate extreme earliness, and it has mystified me greatly, and opened up a new problem, whether a variety will "sport" earliness? As the seed was obtained by purchase from Mr. Hutchins, I have saved seed from these four vines, and intend to give them a thorough test for earliness next season, and do not desire to be quoted as endorsing the extreme earliness of the Emily Lynch, until I have made further tests, as there is too much at stake for a mistake to be made, as this is three weeks earlier than E. E. B. Ferry, planted at the same time.

I have some fine things in my garden, of which I am not permitted to speak by the owners, but there are some fine surprises in store for the lovers of the sweet pea, if the ends of the hybridizers meet their expectations, as shown by their work in my hands—I may have a surprise or two myself.—SAMUEL A. HAMILTON, Sweet Pea Expert, Roaring Spring, Pa.

FIG. 149.—FIVE YEAR OLD PEACH TREES AND GRAPE VINES IN OKLAHOMA.

lor, white, streaked light "purple-heliotrope"; substance, fine; stem, small (needs selecting.)

**STRIPED PENZANCE** (similar to Aurora).—This is the same as Burpee's Aurora, and being an astray from Eckford's Crown Jewel, shows that he has also been after an orange stripe and got a salmon. It tests the same as Aurora.

**SANDED PRINCE** (sport from Princess of Wales) distinct from Gray Friar.—The difference between this and Gray Friar is that the coloring in it is very much lighter and more evenly spread; it has a distinctly "sanded" appearance. It tests otherwise the same as Gray Friar.

**PURPLE STRIPE** (Emily Eckford × Mrs. Joseph Chamberlain.)

**DARK PINK STRIPE** (Emily Eckford × Mrs. Joseph Chamberlain.)

Are both fine sweet peas, but not yet selected to a type. Will be both of value when set.

**DARK SPORT FROM CATHERINE TRACY.**—This is a hooded form of this well-known sweet pea, but is of a darker shade than its parent. It tests: Form, hooded; size, medium; color, cherry, veined dark rose, faintly spotted white on margin of standard.

**DARK FLAMBEAU.**—Is a sweet pea with a future. It has attracted unlimited attention in my garden this season. It is worthy of a separate name and being

**AURORA** (four to a stem).—Is identical with Burpee's Aurora, and brought me only threes.

**LIGHT GALETY.**—Is what its name indicates and tests same as Galety.

Test for variety of colors and shades, (Emily Eckford × Mrs. Joseph Chamberlain) shows eight fine sweet peas, of hooded and expanded forms, covering a large range of shades. All are fine, but need selecting to type. Being the progeny of one plant, it shows a most remarkable "break" in hybridizing. Three of the best shades are: Dark Princess of Wales; dark salmon-pink, broadly striped on white; dark red-heliotrope, faintly streaked on white. All show high form.

LYNCH'S 1897 NOVELTIES.

**THE BRIDE.**—I was unfortunate with this variety. My first two plantings failed to germinate, and the third has not yet given me any good blooms. I hold my opinion of this for another year.

**CALIFORNIA.**—Is a hooded sweet pea of value; at first it seems to be identical with Katharine Tracy, but it is not. It tests: Form, hooded; size, large; color, suffused pale pink center, margined creamy pink—a very soft shade; substance, fine; stem, long and slender.

**MAMMOTH-PODDER PRINCESS OF WALES.**—Is a most unique flower. The foliage as well as the color and form are entirely new. It has the "tubular" wings. It

## Fruit Growing in Oklahoma.

The accompanying illustrations show, to a certain extent, what may be done in Oklahoma in the way of fruit culture.

The photographs were taken on June 20, 1897, in the Cheyenne and Arrapahoe country six miles east of Watonga, the county seat of Blaine County. This country was opened for settlement five years ago and the grape vines (fig. 149), and peach trees in the background are of the same age. The soil is sandy and easily cultivated, yet not so loose that it dries out rapidly to any great depth.

The views are typical and very many such examples of the energy and industry of Oklahoma's settlers were seen in a drive of 375 miles through the territory. Here and there one sees some relics of a failure who "has gone back to his wife's folks" but even he has frequently left a peach orchard to gladden the wayfayer with several juicy peaches.

The other picture (fig. 151) is a view of the home of a farmer four miles west of Ponca City in Kay County. This county is in what is known as the Cherokee strip, which was opened for settlement in September, 1893. It shows a development that is truly remarkable when one considers the conditions. This year's wheat crop has been marvelous, and will be supplemented by a corn crop equally large. The majority of those who "made the run" into the strip had very little cash and practically all of the improvements have been paid for out of crops raised in three years—truly a good record for a new country in hard times.

JOHN FIELDS.

## Strawberries in 1897.

### Report on Varieties.

Our crop of berries this year has been enormous in quantity, large in size of berries, and of the highest quality. The following of the newer and old varieties have been the best:

For productiveness we still place the "Parker Earle" at the head of the list.

We have now fruited the "Ridgeway" for six years and give it the second place on the list for productiveness, and first place for uniform large size of berries, high color, superb quality, satisfactory plant growth.

As a fancy market berry, the "Clyde" comes in a good third; the plant is a good healthy grower, very productive; the berries are of large size, firm, and of good quality; its one fault is that the color of the berry is not as bright as it should be, but still it looks very well when crated up for market.

The "Fountain" has given a splendid crop of large and handsome berries of good form, large size, rich color, and good quality.

"Glen Mary" is a good strong grower, healthy, and productive; berries inclined to be rough.

"Tennessee Prolific" is very productive; berries of good size and color, but rather soft.

"Rio" gave us the first good berries, but soon runs to nubbins.

"Drought King," plant and berries of the "Crescent" type, but larger; is a very satisfactory variety, and will become popular with the average grower for market.

"Brandywine" is a disappointment in our soil. The plant is a good grower and productive, berries of large size, but of a dirty unattractive red in color. (Sold as culls.)

"Mexican," a productive berry; fruit large, good form, medium firm; light red in color, good quality; plant a good grower but subject to rust.

"Aroma," a productive variety in our soil; the largest berries inclined to be rough, but medium-sized berries are smooth and firm; a good red in color; quality good.

"Enormous," plant a good grower nearly free from rust, very productive; first berries are rough but good form and bright color; not very good quality; rots in a wet time; not firm enough to ship.

### NEW VARIETIES.

Of new varieties only fruited on spring-set plants, the following remarks may be made:

"Margaret," a good strong, healthy plant, reasonably productive. The fruit is large, firm, nearly always smooth, of good color and quality; a promising late variety.

"Magoon," a good grower and healthy; fruit large, good form, high color and good quality; worthy of trial.

"Ruby." This we consider one of the best of the new varieties. Plant a splendid grower, making plants freely; productive, berries above medium in size, of bright color, even form, and good quality; very promising.

"Mele," one of the best of plants; healthy, productive, berries of large size, good form and quality, bright and attractive color; worthy of trial.

"Jenny Rusk," a good grower, healthy, productive; berries above medium in size, fairly smooth, good color and quality.

"Seaford." This is a very promising variety; a good plant, productive; the fruit is large, fine in color, and good in quality; will make a splendid berry for a fancy market.

"Louis Gauthier." The new berry from France; the plant is almost an ideal one with large round dark green foliage, entirely different in appearance from American varieties. The fruit is very large, of good form, light rose in color, and in flavor resembles the apricot more than the strawberry. A wonderful variety and should be tested by all fruit-growers.

M. H. RIDGEWAY, Wabash, Ind.

## The Apple Rust.

Apple rust affects the trees in various parts of the country to a greater or smaller extent. The affected leaf has scurfy bunches on the under surface, the corresponding area on the upper surface, becoming orange-yellow, or sometimes almost crimson in color. As the disease progresses the leaf becomes more and more distorted, and in case the injury affects a large proportion of the leaves, serious damage to the tree may result.

It is a curious fact that the fungus which causes this disease, needs not only the apple, but also the cedar or juniper in close vicinity, in order to live and multiply; in other words, the disease does not go from one apple tree to another, but from the apple to the cedar or juniper, and from the cedar or juniper back to the apple. A normal cedar branch looks as shown in 1 of accompanying illustration. If you have cedars near your apple trees, very likely they show the abnormal growth seen at 2, and this peculiar development of the cedar leaves, and the formation of these "cedar apples," or "cedar balls," are the result of the rust fungus. You will then also find the apple leaves blistered with the orange-yellow rust spots. Spraying the orchards with our ordinary fungicides for scab, etc., will assist in likewise preventing the

FIG. 150.—THE CEDAR APPLE STAGE OF THE APPLE RUST. (See text.)

rust; but the surer way of accomplishing this object is to cut down the cedars and junipers, thus destroying one link in the chain of the life of the rust fungus.

## The Fruit Garden.

**Cherries.**—Standard trees, after the first two or three years, require no pruning, unless, as sometimes happens, a branch growing across another has sagged so that it rubs on another below; in such a case the present is a good time to remove one of them. The cherry is apt to bleed, or gum considerably, so that pruning of old trees should be avoided as much as possible. When it becomes necessary to cut out deadwood from old cherry trees, it is time to buy young trees to replace them. Young trees should be trained by disbudding in summer, rather than by the knife in winter.

**Fruit Rot** is getting in some fine work just now among plums, nectarines, and cherries, with the almost daily rains, and close, muggy atmosphere. Spraying for it is practically of no use in this vicinity.

**Blackberries.**—They are in their glory in this kind of weather, great luscious berries in plenty. Just now I am interested in three lines of Snyder that were well matched last December. This spring the laterals were pruned back on No. 1 to about 9 inches, on No. 2 to about 20 inches, while on No. 3 no pruning was done, nature having a free course. Which way will pay best is yet to be seen, but I know that No. 1 is not the best.

**Apples.**—Clean up all fruits from under the trees, and make fertilizer with them. First to destroy any worms yet in them, and secondly for appearance's sake.

**Plums.**—Abundance and Ogon come in good for use just now, with red Astrachan apples. J. HOLLOWAY, L. I.

## Chrysanthemums.

**Feeding.**—So long as the plants are making a strong healthy growth, they do not need any stimulant; but some of the earlier potted plants will now be rootbound and will be improved by a liquid of either cow or sheep manure. I believe that when plants will carry along in good condition till the bud is set, without feeding, they are better for it, but just so soon as you get the bud, feed it "for all it's worth," and then the flower gets all the benefit. No hard and fast rule can ever be laid down as to when feeding should begin, but the man who watches his plants closely can tell at once when they are not happy. When the foliage begins to get pale (if the paleness does not proceed from overwatering) is a sure sign that the plants are in need of a pick-me-up.

**The Potato Bug** has begun in this section to pay attention to the Chrysanthemum. During the past year or two I have made the acquaintance of many different insects around and on the plants, but the potato bug is a new one to me. I presume the young would hatch out all right and set in to feed if the eggs were left alone. If this kind of thing keep on, all the gardener of the future will have to do will be to plant a row of chrysanthemums along one end of the garden, when the myriads of bugs and insects will settle right with them, and all will cease from troubling and the gardener be at rest. A fortune awaits the introducer of a new insect-proof, self-disbudding variety. It will fill a long-felt want.

**Specimen Plants** should not be stopped again, as it is getting late in the season for such work. If the pots are now full of roots, give a good top dressing of cow manure. It is a great help, because plants so treated do not dry out nearly so soon as others left to themselves. C. TERRY, N. J.

## Slime Mould on Lawns.

A correspondent recently forwarded some blades of grass with leaves of clover which he had gathered from his lawn. They were covered by a substance of a slaty black color, and our correspondent was somewhat alarmed for the soddy patches did not add to the beauty of the natural green.

The development upon the grass is due to one of the slime molds (*Physarum cinereum*). As a slimy substance, it literally crawls up from the ground upon the blades of grass, and then changing its color oftentimes from a yellowish orange to a brown, it produces its vast crop of spores. The fungus is not parasitic upon the grass, and only injures it by using the grass as a place for the production of its spores.

It is not unusual to have these slimy moulds appearing in this way upon living vegetation, particularly that which is close to a rich earth, and during moist weather similar to that which has obtained during the last two weeks. Not being a parasite, and only coming occasionally when circumstances are peculiar, there needs to be no alarm nor action taken in the matter. One cannot foretell where this slime mould will rise from the ground, and therefore, there is no guide as to where to use any precautionary measures. In fact, it would be difficult to use any under the circumstances.

BYRON D. HALSTED.

**Plums and the Tariff.**—"My dear sir," the collector of duty will say to the importer of plums, "you have in this bag 62 pounds of plums. Section 264 fixes the duty on plums at 2 cents per pound. You owe me \$1.24." "My very dear sir," the polite and guileless importer will answer, "you mistake. I have in this bag a bushel of plums, although it happens that the bushel weighs 62 pounds. Section 262 fixes the duty on plums at 25 cents per bushel. I owe you a quarter of a dollar. Here it is. Take it, my dear sir." Then they will clinch.

## The Early Celery.

### Blanching and Marketing.

In an article which was published a few months ago in "American Gardening," my method of growing celery by the "new celery culture" was detailed, and as I have been successful in marketing at a good price all the early celery I am able to grow, it may be that my experience will be of use to others.

There are some difficulties to be overcome in handling celery during the hot weather (July and August) if it is to be placed on the market in good condition, but when I have been able to produce good celery at this time of the year, I have found it much more profitable than that marketed in the fall months, when the market is well supplied and prices consequently low.

#### BLANCHING.

For this early celery, in my locality, I have found but little competition, and have been able to obtain good prices from the proprietors of fashionable hotels and summer resorts. There is also a large enough number of rich people in the near-

out irrigation, for when the plants are so close together a large growth cannot be had without it, and moreover during hot, dry weather blanching goes on too slowly, and the stalks often become stringy, or hollow. When the boards are set up, run the water in the vacant space between them, thus hastening the blanching and improving the quality of the celery.

When the celery is sufficiently blanched, the boards are taken down and removed to other rows. The celery is cut a little under the ground and trimmed, leaving the refuse on the ground. If the sun be shining, the celery is at once carried to a cool cellar near by, and if not at once packed for market, we stand it up in a vat containing one or two inches of cold water in the bottom. This is all the water that is allowed to come in contact with the celery, for as there is no earth used in banking it, it needs no washing.

Never pack wet celery for shipment, as it is liable to heat and spoil. If it be necessary to hold the celery a few days after it is cut and trimmed, it can be kept in good condition by packing ice around the vat in which it is stored, and making the cellar as cool as possible.

on the general market, distribution would cost so much that the profits would be reduced.

In a word, the conditions of success are: a near-by market where fancy prices can be obtained, suitable soil (that which is easily worked and retains moisture), large quantities of fertilizers, and water available for irrigation.

W. H. JENKINS, Delaware Co., N. Y.

## The Vegetable Garden.

**Weeds.**—After the heavy rain we have lately experienced everything is growing rapidly now in the garden, and as nothing can or will outgrow weeds if allowed to get a start, they must be kept in check by frequent hoeing, and it is best at this time to rake away the weeds, or they quickly take hold and grow vigorously again.

**Egg Plants** should now be setting their fruit. To do well they need constant attention. A liberal dressing of unleached wood ashes is of great assistance to egg plants, especially if one require first-class, well formed, and well colored fruits. One pint distributed to each hill and well raked or hoed in will answer the purpose, and will well repay the trouble. Liquid manure from the barnyard drainings applied not too strongly after rain is also of great help to backward plants or those growing in somewhat poor soil. The salient points in the successful growing of egg plants are good rich land and good culture.

**Tomatoes** should be carefully looked after, particularly after so much rain. All ripe fruit is to be regularly gathered. Do not allow the vines to grow too densely, as they will now be inclined to do; this should be done by pinching back all unnecessary laterals. This should be done if possible while the growth is small, as by cutting away several large vigorous branches at one move, a sudden check is given to the whole plant, and prevention is better than cure in all cases. Keep main branches tied up where the plants are grown to a trellis. Tomato vines should not be allowed to run on the ground; if done, the fruits are liable to be infested with wire worms, and so spoilt; they are also subject to fruit rot; keep the vines above the ground; let the air circulate freely among them. Wood ashes are excellent for tomatoes.

**Melons.**—This is not a very good time for ripening melons; they are not so sweet after so much rain. It is always an advantage to plant vegetables, especially melons and tomatoes, on well-drained land. The vines now will be covering their allotted space which makes it a difficult matter to cultivate them, in doing which care should be exercised not in any way to bruise the vines, as the damage done in this way now is irreparable. Pull out all prominent weeds that may appear above the foliage.

**Lima Beans.**—Several hills of our lima pole beans are this year attacked with a small maggot or nematode, or possibly some fungus. I have not yet determined which; the roots are infested, and the plants attacked wilt and die down. The trouble has made its appearance here since the hot, wet weather set in. I have watered several hills with lime water, as an effort to check the evil. Will any readers who may discover a sickly appearance in their pole limas, communicate with the editor, and give their experiences, as an aid to further research into the trouble?

W. M. EDWARDS, Conn.

### Preparing a Compost Heap.

Please inform me through American Gardening how to prepare a compost heap as regards the kind of manure, manner of handling and applying? I am an amateur in horticulture and, although I have read a great deal about compost heaps, I have never heard how to prepare them.—A. SUBSCRIBER.

—Every once in a while a question similar to this is received and during last year the desired information was given some four or five times. As a detailed article of instructions appeared so recently as December 12 last we refer our correspondent to that issue, page 792.

FIG. 151.—AN OKLAHOMA HOMESTEAD. (See Page 535.)

by villages, so that I have found customers for all I could grow.

In blanching celery during warm weather, care must be taken that no soil comes in contact with it to rust it; it cannot, therefore, be banked with earth. I have tried tying wrapping-paper around the bunches, and other methods, but have found that I could blanch the celery at a much less cost—and blanch it better, too—with boards.

After much experimenting in planting at different distances apart, the plan which I have now adopted as giving the best results, is to plant double rows two feet apart, i. e., plant two rows 10 or 12 inches apart, and next leave a space of two feet.

When the plants are about one foot high, place the blanching boards on both sides of the double row, but be sure to keep them well apart, for if the leaves get wet between the boards, and the sun does not get in to dry them they will rot and spoil the appearance of the celery, besides stopping its growth.

When the celery grows a few inches above the boards, crowd the boards closer together, and the blanching will be completed in a few days.

The boards I use are from 12 to 18 inches in width, and with them blanch celery that grows two feet high or more. I hold them in place with cross pieces notched to set over the tops of the boards.

I have never been successful in growing a good quality of early celery with-

#### SELLING.

As to selling, we try to retail all we can from the market wagon which goes out with a load every day. For the wagon we put up the celery in berry crates, removing the baskets and fillers. For shipment to hotels and summer resorts, the celery is packed in small baskets holding two or three dozens. That which is shipped to dealers is put up in baskets holding six dozens.

When retailing celery from the wagon during warm weather, a wet blanket may be thrown over the crates, and if a part of the load is not sold, it can be placed at night in the cold storage vat and sold the next day.

The celery is retailed from the wagon at 4 cents and 5 cents per bunch, and sometimes for the very early celery I can get a little more. I usually find a good reliable man to drive the wagon, and pay him a commission on his sales.

The celery put up in small baskets for the hotel trade realizes for the earliest, from 40 cents to 50 cents per dozen net, and later in the season, 35 cents.

For that which is sold to dealers I receive 30 cents per dozen.

Though I have been able to obtain larger returns from my land and labor in growing early celery than I have from any other crop, it is only after years of experience that success in growing it has come. Celery at this season is a luxury, and there are only comparatively few people who can afford to buy it, so it costs a good deal to distribute it. If sold

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per agate line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

**Growing the Nitrogen.** The eagerness with which one will run upon a new idea is one of the greatest troubles that have beset the tiller of the soil in all ages. Given the emphatic demonstration of the value of a new practice, it is safe to conclude, that, despite the thorough showing of its efficacy at the hands of the skilled experimenters, there will be hashed up from all over the country an apparently weighty mass of evidence, going to show that the teachings of the more advanced minds, if not all wrong, at all events have the appearance of being too highly colored with the desire of the experimenter to impress value on to his own work.

That such has been the case with many of the results of applied science in our experiment stations does not need argument nor illustration to prove. Willing as is the American cultivator to avail himself of the very latest teachings of science towards the easing of his labors, yet up to within a very recent time, the cultiva-

tor has not been in the position of being able to adapt to his own locality the fundamental principles of a new discovery, and by a skillful manipulation of the superstructure, realize the full benefit from following such a course.

While not every one even can conduct an experiment, there are still fewer who are able to deduce from the results, those proper conclusions that are open to one having had the mind properly trained to appreciate the relative value of the factors bearing on the result. Again, an experimenter must be able to recognize any accidental issue that may have disturbed the proper course of events.

The young cultivator of to-day can, if he will, start into his battle of life with an equipment of mental perfection and analytical power that was not open to his forefathers. The courses in agriculture and horticulture which are provided for his benefit by the numerous colleges and educational institutions of the country put at his feet this great advantage, and as a consequence, the technical literature of this country is flavored with scientific reasoning and teaching to an extent that causes no little wonder to the European reader.

Yet all this is but as it should be. In no other country in the world does the government devote such interest to the promotion of agricultural interests. The amount of money appropriated to this end for the fiscal year 1897-'98, amounts to \$1,890,000.

There is perhaps a danger that with such a large sum of money to be expended, there will be a waste, and, indeed, it is a fact that some of the work done by experiment stations is hardly creditable to such a munificent monetary gift. What is wanted is concentration and coöperation between the various stations. It is not to the best advantage of the public that re-hashes of previous publications in other states be made and published in bulletin form, something more real is wanted. Why not, for instance, let all the states investigate a matter of general importance and issue a combined report available for the whole country!

And this brings us back again to our original line of thought. Take as an example the use of nitrogen catching crops to improve the condition of the land. When crimson clover was first brought prominently into notice some five years ago, as a consequence of the attention it received and of certain undoubtedly good results from its use, many farmers "experimented" with it, and many very conflicting reports were given out. To-day it is still debated as to whether crimson clover should or should not be carried over the winter alive. Let us inquire into the philosophy of the use of this crop: It is on account of the storing of nitrogen in root tubercles that the clovers are valuable as nitrogen catchers. But it is not for what is caught and stored that we grow the crops; we desire to get the nitrogen into the soil, and it is not until decay of the plant sets in that this end is attained.

There is no doubt but that the greatest amount of nitrogen is caught by the longest and best growth of the crop, and if it can be carried over to spring, and then plowed in so much the more is

gained; but at the same time there is a gain if the plant be grown for ever so short a period. It is a catch crop, and for the amount of work it does as a fertilizer late in the season, is unequaled by any other crop known.

In order to obtain the best results from the use of crimson clover, it must be sown early to allow it to gain sufficient strength to live over winter, yet not so early as to give it time to shoot into flower the same year. Here is the crucial point, and the period for sowing is short, perhaps only about two weeks in any given spot varying from the early part of July, in the extreme North, to later as one goes South. In the neighborhood of New York about the first week of August. It is as late ordinarily as can be relied upon. The plant is really an annual and will make its growth in the same year as it is sowed if it has the chance to do so.

## Disease of Sycamores.

On page 538 of this issue, we give two views of Sycamore trees: the one has been badly affected by the blight or anthracnose, while the other on the opposite side of the same street is in full vigor and unaffected. As we gave a detailed description of the disease and its method of working so lately as on page 506 of issue for July 17, it will not be necessary to enlarge now. So far, the only remedy appears to be the cutting out and burning of all affected twigs and branches.

## Home Evaporator.

Some time ago a reader inquired of us concerning a small fruit dryer for home use. After some search we have, we believe, found the particular one inquired about, and particulars may be had on application.

## "The Water Garden."

Owing to the expensive character of this work, the publishers have been compelled to set the price at \$1.50. The volume is now on the press, and every effort will be made to publish it at the date given in the advertisement elsewhere. Orders are coming in rapidly, and all who wish to secure a copy of the first edition should apply promptly. The work, intrinsically, will be of undoubted value, and the typographical appearance of the book itself a magnificent product of the printer's art.

## The Greatest Park in the World.

Writing of "The Greatest Nation on Earth," in the July "Ladies' Home Journal," William George Jordan says: "Uncle Sam set apart a royal pleasure ground in Northwestern Wyoming and called it Yellowstone National Park. To give an idea of what its size, 3,312 square miles, really means, let us clear the floor of the park and tenderly place some of the great cities of the world there, close together as children do their blocks. First put in London, then Greater New York, Chicago, Philadelphia, Paris, Boston, Berlin, St. Louis, Hong Kong, San Francisco, and Washington. The floor of the park would then be but half covered. Then lift up Rhode Island carefully, so as not to spill any of its people, set it down and press in the West Indies—and even then there are 200 square miles left. No equal area in the world has such a diversity of natural phenomena and such magnificent scenery. It is a marvelous land of streams and waterfalls, geysers and hot springs, mountains, cañons, lakes and forests of primeval age."

New Orleans Horticultural Society held its annual election Thursday, July 15. The following officers were elected: Ed. Baker, president (re-elected); Dan Newsham, vice-president; John Eblen, treasurer (re-elected); Paul Abele, secretary (re-elected).

## Strawberries.

### More About Summer Planting. 700 Bushels to the Acre.

I wish to write a few words in answer to Mr. Hale in "American Gardening" of July 24:

In speaking of his thirty years' experience in strawberry growing, Mr. Hale calls our attention to the fact that we have been growing old, and that we have been growing strawberries for twenty-five years. We have learned from practical experience that the summer planting of pot-grown strawberry plants can be made profitable, no matter what Mr. Hale says to the contrary.

We are pleased to have Mr. Hale take the responsibility of advising one to set 20,000 plants to the acre for summer planting—we most certainly don't want the credit for this statement. What connection this statement of Mr. Hale (made in his former article on page 490) had with our address at the American Institute we fail to see; it is misleading. However, your readers will now know that it is Mr. Hale, and not us, who goes on record as advising 20,000 plants to the acre for summer planting. We are very anxious that there should be no misunderstanding on this point.

Mr. Hale is getting closer to facts in his second letter when he says "planters use from 6,000 to 8,000 plants per acre," and that the cost of these plants would be "from \$20 to \$25." This is about the market price for this number of plants. However, in his first communication, when speaking about setting 20,000 plants to the acre, he says "plants for setting an acre can be bought in the spring for from \$18 to \$25," and he certainly gives the impression that 20,000 plants can be had for this money.

Mr. Hale, on page 525, is trying to make us use 20,000 plants for summer planting, and then he multiplies this by \$18, making a total of \$260. There is a saying that there is no one so blind as the one who "will not see," and this seems to fit Mr. Hale's case exactly. Mr. Hale can advise the use of 100,000 plants to the acre, if he wants to, but he must not endeavor to get us to answer for his sins. We will repeat our former statement. We advise 7,500 plants to the acre, and these, at the prices we named per 1,000, would cost less than \$100.

Mr. Hale very much overreaches himself when he doubts our ability to furnish enough pot-grown plants a day in the season to plant one or two acres of ground. We have constantly on hand during the summer months 40,000 pot-grown plants. We ship every week from 15,000 to 20,000 pot-grown plants. I do not believe our customers will mind us using their names to show what we are doing in this direction. A few of the large orders we filled last week were received from the following people:

Mr. H. McK. Twombly per E. Burnett, Madison, N. J., 1,000 pot-grown strawberry plants. Mr. John Dodd, New Milford, Conn., 1,200 pot-grown strawberry plants. Mr. J. C. Dieterich, Jr., Alleghany, Pa., 1,000 pot-grown strawberry plants. Miss J. Grace Alexander, Winchester, N. H., 900 pot-grown strawberry plants. Mr. Edward Rushmore, Plainfield, N. J., 700 pot-grown strawberry plants. Mrs. W. B. Wilcox, Taftville, Conn., 550 pot-grown strawberry plants. Mr. C. A. Capen, Canton Junction, Mass., 300 pot-grown strawberry plants. Mr. T. M. Hegnembourg, Dunkirk, N. Y., 450 pot-grown strawberry plants. Mr. J. M. Richards, Cornwall, N. Y., 450 pot-grown strawberry plants.

Here are only nine customers—we are not counting our orders to the trade, or the dozens of smaller orders sent out during the past week. Moreover, this was an unfavorable week for shipping, owing to the excessively wet weather. The week previous we shipped considerably more, and this week we will ship double the amount forwarded last week.

We have purposely gone into these details, fearing that any of your readers may infer from Mr. Hale's supposition that we are not able to furnish at any time during the season, all the pot-grown plants they wish to purchase. An order

for a few thousand of these plants will not "swamp" us, as Mr. Hale thinks. Besides, we are advertising in your paper, and we don't want people to think that we are unable to furnish them with the plants they want. This, as you see, is another good reason for giving the facts as stated above.

In regard to the yield of strawberries per acre, as Mr. Hale and every well-informed fruit-grower knows, circumstances have much to do with it. Where the conditions are all favorable one can grow a great many bushels of strawberries to the acre. More bushels in fact, that he could get many to believe he grew, unless they saw them.

Mr. Hale asks me if I ever grew strawberries at the rate of 585 bushels to the acre. I answer him: "Yes. I have often done it and have often seen it done. One of my neighbors fruits them every year at the rate of 700 bushels to the acre. He fruited them at this rate the past season. I don't want to be understood as saying that this result can be always accomplished. In fact, it is rarely that such good results are realized. However, they are possible, large as they may seem to the inexperienced person. I would feel quite safe in guaranteeing to grow 400 bushels of strawberries to the acre for the first, second, and third years after being planted.

Mr. Hale or any other practical fruit-grower can do fully as well as this, perhaps better. The possibilities of the strawberry under favorable conditions, are away beyond the expectation of the average horticulturist. T. J. DWYER.

## In a Louisiana Garden.

**Phlox.**—In the hardy borders now, the perennial Phloxes make a fine show, in white and so many shades of red and purple. They need plenty of water now, and the whole plant should be showered with water every evening, as the big loose heads of bloom get unsightly from dust. These plants grow well in shade and against fences and walls where many other plants would not bloom. With us the season of bloom is long—from June till frost in November. I find it best to get plants from the florist, as seed does not come up well for me. After the plants are started they are little trouble. Keep the weeds out; if they get too thick dig out some in the winter. I throw rich soil over and among mine and notice by doing so I have early and large flowers and plenty of them. Late of evenings the flowers of the Phlox are quite fragrant.

**Golden Leaved Salvia.**—When it first came from the florist it was golden-leaved, but when I set it in the garden I cut off all the top and made plants, and every one grew; result, I have plenty of green-leaved Salvia; one could not tell which of the plants were golden-leaved, all are alike, and all are just like the old Salvia that is now making such bright patches in the garden. There are plants of it over three feet across and four feet high.

**Salvia Patens** I have poor success with, seed never comes up, so I beg the plants from my florist. But there is another lovely pale blue Salvia here just coming into bloom. It is hardy, and has long terminal spikes of bloom and pale green foliage.

**Cannas Italia and Austria.**—Hot July weather, but the Cannas are ablaze with color. In the garden now are about forty varieties, from a foot and a half high, to six feet. Italia and Austria set this spring are five feet high in damp soil, and have been in bloom two months. Some of the blooms have measured eight inches across. Much has been written of the frail flowers, but I find them as lasting as those of many other Cannas. It may be because mine are at the east of the house in an angle at the end of the gallery, and only get the sun till ten of mornings; they are near the water, too, and many a bucketful is thrown on them every evening. As soon as a stalk has finished blooming, I cut it off near the ground. Plants have thrown up already several bloom stalks and plenty more are showing.

MARGARET E. CAMPBELL, Louisiana.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

In the early part of the season when we cut back the newly-set peach trees we left one or two more of the most prominent buds on the side from which the prevailing winds came than on any other side of the tree. This is quite important, especially where the young orchard is in a location where the winds have full sweep.

Small fruits like strawberries and raspberries should be picked as soon as ripe (not "dead ripe"), as then they present a much more attractive appearance in the boxes, are more firm, and will keep much longer.

We make it a point after having finished work with any kind of a hoe, shovel, cultivator, or any other garden tool, to at once put it under shelter thus keeping it in good repair two to three times as long as if left exposed to the weather.

At the beginning of the raspberry picking season the extremely hot and dry weather was a great setback to the earlier ripening berries, but about the 14th heavy rains came, and now, July 18, we are having the finest well plumped up raspberries we ever grew.

How the grand old red Cuthbert raspberry is standing by us this season! It is bringing us two cents per quart more than any of the fancy varieties, and such a lively demand for it! I will venture to say that the Cuthbert will be grown by the most progressive fruit-growers for many years to come, but right here let me say that it does not like neglect and will pay in more and finer berries the next year for every time the cultivator and hoe is used around it.

Vegetable gardeners complain much this season that they never saw the potato bugs so thick.

I fear I made a mistake in recommending the Improved Wilson for a shipping berry.

I have no doubt that leaving ripe fruit to dry up on the raspberry bushes injures the plants. If there was a glut in the market, rather than leave them on the vines, I would take the clippers and at once cut out the fruiting canes and give the new growth the advantage.

Where we scattered straw over the mowed-down strawberry plants in the old patch and burned it over, the plants are coming up fresh and green.

On a part of the patch of Lucretia dew-berry hills we will drive a stake close by each hill and tie the vines to it to get them up away from the cultivator, as they are making such a lively growth that they are spreading all over the ground.

Yes, the old strawberry beds are a great place for the propagation of insects and of fungous disease, but a good burning over cleans out all.

Did some of your raspberry bushes get weighted down with fruit, so that some of it was in the sand? A little straw along the row at fruiting time would have prevented it, or the bushes tied to a strong stake or trained with wire along the rows. The Schaffer seems much inclined to do this.

What are we to do with prices so low for some small fruits? My answer is this: High prices or low prices, go ahead and raise finer fruit than ever before, but not more than can be handled to advantage. If you have some varieties that are inferior to those of your neighbors, discard them as soon as you can get into bearing others that are considered the best. In the meanwhile, take the best of care of the kinds you have; prune them closely next spring, so that the berries will be larger in size. None but the best kinds pay.

As we wished to grow a large amount of plants from our Gregg raspberries, we cut the fruiting canes very close, and left only from one to two canes in a hill. The berries are extra fine in every way, but, of course, there are not as many quarts to the hill as if three to four fruiting canes had been left. The result is a heavy and strong growth of new wood.

Red raspberries keep much better if canned the same day as they are picked.

CHARLES NASH.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Prunus pissardi Dropping Leaves.**

—For the past two or three years, my *Prunus pissardi*, almost as soon as the new leaves are fully developed, has regularly dropped almost all of them; and after remaining almost bare for a week or so, has put forth a new crop, which develop perfectly and remain on till frost. I have never been able to detect any insect or fungous enemy, although I have sprayed the tree in winter with strong copper sulphate, and later with mild Bordeaux, since the first season when the tree behaved in this manner. Naturally it makes but little growth, though carefully cut back in winter. This year, as the leaves were falling, I found for the first time a numerous crop of aphides on the branches; but attribute their presence to the enfeebled condition of the tree rather than suppose them to be the cause of the trouble. Can some one diagnose the difficulty, and suggest a remedy?—H. B. C.

**Campanulas and Delphiniums in La.**—I read with interest the "Notes from the Herbaceous Garden," on page 502, issue of July 17. The Canterbury bells come up here from seed sown in the fall, grow till late the next spring, often throwing up plenty of tall bloom stalks, and just before the color of flowers shows the plants seem to soften near the ground and in a little while they are dead. One year I had three to bloom from over 100 plants, one was white, one pink, and the other a lovely blue. The plant of the latter was fully as large around as a flour barrel and almost as high, and one mass of lovely blue flowers all of April and May; many of the stems were wide, flat, and ridgy. (A case of fasciation.—Ed.) It was one of the most beautiful things I ever saw. That was years ago, and nearly every year since I have planted seed in the fall only to meet with disappointment.

As to Delphiniums, the trouble here is to get the plants to grow till blooming time; I have four plants now in bloom; they are three feet high, the flowers in long loose terminal clusters, and of a most lovely shade of blue—I call it *Salvia patens* blue. The foliage is woolly and deeply cleft, the plants branching with scattering foliage on the branches. My seed was planted in February, and on the north side of the house. The plants have been in bloom since the early days of June; still they are perennials, for I have had plants and seed from florists several times before. Plants from florists generally grew and gave a few flowers, then turned black at the ground and died; plants from seed planted in the fall made good growth till May, when rains set in and they would die, no matter what kind of soil or situation.—MARGARET E. CAMPBELL.

**Burning and Other Matters.**—In reply to Mr. Snyder's letter appearing in your issue of July 17, I would state that as a rule, neither man, beast, nor vegetable can thrive or be healthy in a temperature varying from 40° to 80°. Mr. Snyder and his plants must be exceptions. He says that blistered glass will injure some tender foliaged plants. Does he mean to say that *Lantana borbonica*, *Dracenas*, *Aspidistras*, etc., are tender foliaged plants? In this section any plants whatsoever will be burned by blistered glass. Mr. Snyder never syringes roses overhead, and in spite of the violation of this common rule, never suffered from red spider; I have never had potatoes burned after a slight shower. If Mr. Snyder will look over my first communication discussing "watering during sunshine," he will find that I recommended watering thoroughly or not at all. Mr. Snyder states that he gained all his knowledge by experiments, and kindly volunteers to teach me a few points if I will visit or

correspond with him. I am very glad to profit by Mr. Snyder's knowledge and experiments, as he assures me he has "no old-fashioned ideas to combat nor prejudices to overcome." I, for instance, was compelled to serve a four years' apprenticeship, wherein, of course, he has an advantage over me. But it seems his experiment in forcing strawberries was not altogether a success, and in this connection we gardeners of the old school might be able to give him some points. Likewise his experiment in securing lateness is a thing of the past. Anybody having forced strawberries knows that forced plants, planted in open ground in the spring, will give a second crop if the forcing was a failure. As to transplanting poppies in the greenhouse, no Northern gardener would attempt it, as we have something better and more useful. Mr. Snyder thinks it a miracle to have Callas from Christmas until now. We could have them also, but we think it is more beneficial for the plants to have a rest when we have any quantity of other cut flowers outside. Mr. Snyder's method is to reduce cost to a minimum. By this, I assume, his object is to save fuel, and I think this is where he makes a mistake. By trying to save a half-ton of coal the plants receive a check in damp, cool weather, from which they suffer for months afterwards.—N. BUTTERBACH.

**Clematis Dying Off.**—With reference to what was published in your two last issues we have to report similar experiences in our business. We do not believe the trouble to be due to a disease, however; our theory being that it is due entirely to the care of plants previous to planting. This difficulty is particularly noticeable in imported plants. Such plants come to this country in large bunches, with but little material among the roots, and we hold that in this way the tissue of the roots is damaged, and though the damage is not apparent to the eye, yet is of such extent as to prevent the new rootlets from starting. All must agree that healthy growth of the tops, depends upon active new growth of roots. Now, when such damaged stock be planted, the temperature and dampness induces growth, and the top starts. This is maintained by the energy stored within the old roots, just as a *Colchicum* grows on the shelf in a dry office. But as soon as this energy is exhausted the top dies, simply because there are no new rootlets to maintain it. Any person so disappointed can verify this by taking up the plant and looking (in vain) for the new rootlets. The remedy is: Look shy upon imported stock, or teach the importer a lesson in packing, and at the same time see that the fault is not with yourself after stock is received. It would aid partially damaged roots by cutting off severely, thereby giving new surface from which new rootlets can start. Are we mistaken?—L. TEMPLIN & SONS, Calla, O.

I see in your two last numbers a discussion on the Clematis dying. Now I have had the same experience as have Mr. H. J. Bothe and Mr. H. A. Siebrecht, and it may be that if they will examine their vines when they are dying they will find they are stung by some insect and that there is a worm in the pith, causing the dying. It will be found above ground, and not generally over two feet from the ground. I know what I am talking about, for I have taken some out this summer. I do not think that Mr. Siebrecht's proposed planting in fall will make any difference.—FRANK KNAUF.

**Strawberry Colonel Cheene.**—For the information of M. J. B., Mich., would state that I got Colonel Cheene's strawberry plants at Plymouth, Mass., from a private grower. I do not know if they are for sale, nor if they are ever called Kentucky.—R. C. P.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

## Odds and Ends.

A neighbor figured on raising quite early melons by planting in raised hills. Soil was drawn up in hills four to six inches high and twelve to fourteen inches in diameter. In the top of this hill he planted the seed, only to be sadly disappointed in finding the hills dried out and only about 25 per cent. of the seeds germinated. He was about to blame the seedsman, but his neighbor, to whom he gave a handful of the seeds, said the seed was all right and grew nicely; hence we see this time the planter was at fault, not the seedsman.

Try to keep plenty of fresh drinking water standing around in the shade for the poultry. Three times each day is none too often to change it.

The longer we grow fruit the more we are of the opinion that it is not so much the amount of ground which is planted out as it is the care which is given from the start to the finish.

**Beware of Ointments for Catarrh that Contain Mercury.**

as mercury will surely destroy the sense of smell and completely derange the whole system when entering it through the mucous surfaces. Such articles should never be used except on prescriptions from reputable physicians, as the damage they will do is ten fold to the good you can possibly derive from them. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, O. contains no mercury, and is taken internally, acting directly upon the blood and mucous surfaces of the system. In buying Hall's Catarrh Cure be sure you get the genuine. It is taken internally and is made in Toledo, Ohio, by F. J. Cheney & Co. Testimonials free. Sold by Druggists, price 75c. per bottle.

## Business Cards.

C. D. Zimmermann, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished

**LAND DEVELOPMENT.** consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. J. W. Forsyth Johnson, P. O. Box 188, New York City

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance. The address will be charged as part of the ad., and each initial or a number, counts as one word. No cuts or display type allowed.

**HULSBOSCH BROS.**, bulbs and plants, Englewood, N. J.

**LOWEST PRICES** on earth. Trees and Plants. Neil the Nurseryman, La Porte, Ind.

**TRANSPLANTED CELERY PLANTS**, all the leading kinds. John A. Smethers & Son, P. O. Box 104, Berwick, Pa.

**GLASS** at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York

**EGYPTIAN ONION** sets, for immediate delivery if wanted, \$1.00 per bus. F. O. B. Streator, La Salle Co., Ill. Address R. D. Kline.

**CELERY PLANTS**, strong and stocky, \$1.00 per 1000, \$5.00 per 10,000; satisfaction and safe arrival guaranteed; special low express rates. The most practical and complete book on celery culture, 75c. Peter J. Schuur, Kalamazoo, Mich.

**CELERY PLANTS**, Transplanted only. First-class, leading kinds. Greatly superior to seed-bred plants. Carefully packed; good for two weeks transit. 40c. per 100, \$3.00 per 1000. R. M. Wallis, Towanda, Pa.

## Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**WANTED**, steady position on gentleman's place; by an industrious, honest and sober German, married, one child; thoroughly understands the care of horses, carriages, garden, cows, etc., with references. A. Sorgenfrei, Box 200, Tarrytown N. Y.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### As the Novelties Grow.

*Solanum Wendlandi* gives no sign as yet that it is to be of any value. Procured in March, it has stood absolutely still ever since, although the plant seems to be in good condition. The pale green delicate foliage of the Lotus, Coral Gem, is both pretty and peculiar, but the plant does not yet seem strong as to growth. *Æruea sanguinea* is slow of growth and unpleasing. *Vulcan Begonia* is not standing full sun heat as well as we had been led to believe, but in color and profusion of bloom it is unsurpassable. *Asparagus Sprengeri* has been named by some the most beautiful plant of its kind; while the general verdict will, probably, not bear out this rating, there seems to be no doubt that it will prove a very strong addition to the list of plants for the window garden.

#### Among the Roses.

In a lot of some 25 Roses, procured during the spring just past, nearly all novelties, and from several different dealers, only two have died. These are *Mosella* and *Mrs. J. Sharman Crawford*, the latter badly mildewed when received. As to bloom, *Madame Abel Chatenay* has already been mentioned as very fine. *Mlle. Germaine Trochon* is not so large, nor of so good form. Neither is it so good a grower, with us, but in color and texture it is fine, and the tea fragrance is very pronounced. The color is a beautiful salmon cream. *Madam Pernet Ducher* is very delicate in creamy yellow, though not so double as one could wish. Neither of the last two is very large.

#### Growing Yarrow.

"What is that fine, delicate, drooping plant in the pot yonder?" one asked the other day. "With all your Ferns and Palms and Butterfly Lilies and so on, it is quite the prettiest thing you have." The plant was Yarrow, transferred to the pot from a waste field some two months ago. The foliage is of an odd and somewhat rare shade of green, and the plant is exceptional in the delicate fineness of its lacinations. The outer foliage droops gracefully over the pot, making the plant excellent for bracket use, and the delicate young growths are coming on very nicely. It is fully worthy a place in the most aristocratic collection, to grace the summer window.

#### Ivy Leaved Geraniums.

One of the newer of these rejoices in the name of *La France*, which gives it an immediate entry into the affections of all. The *La France* color is taking wherever found. Perhaps the greatest value of these plants is for window-box and vase use. The colors are bright, the foliage unsurpassed in many ways, the habit excellent, and the capacity for clothing the receptacles with greenery very good.

#### Repotting Plants.

It often happens that certain plants stand still with no apparent reason therefor. There may not be that "going off" of foliage which indicates the resting period at hand, and the cultivator is at a loss to know how to manage the case. The trouble sometimes lies in the constant packing of the soil caused by surface watering. Cultivation may remedy it, but repotting is usually better. In a case like this, a larger pot will not be needed, and indeed, as the free soil crumbles away from the roots, it may be found that a smaller size will suit them better.

#### Cecile Brunner's Proper Place.

Among all the varieties of polyantha Roses known to us, there is not another that seems to merit equal praise with *Mlle. Cecile Brunner*. (*Clotilde Souper*, being a hybrid, is not considered in this comparison.) *Brunner* is a strong grower, for a polyantha; its color and shading are beautiful; its form entirely distinct and very pleasing. In form and size it reminds one very much of some of

the most double of double Balsams. It does not seem well known among amateurs for a Rose that has been before the public so long. Probably this is because dealers have neglected to praise it according to its real merits. Is there anywhere another equally beautiful Rose which blooms in such immense clusters and so persistently throughout the season?

#### The American Working Hen.

While the workingman is complaining that he does not get his just deserts, the American working hen, who never gets hers keeps persistently on at her task. Her earnings for a single year, according to an estimate based on the latest census returns, have been more than enough to pay for the education of all the sons and daughters of all the 14,000,000 families in the country for the same year. Enough, that is to say, with the little trifle of 12,000,000 over. Our poultry product for a year, statistics say, even though they are but the aggregate of littles—of littles hardly worth the attention of any man—are four times our output of silver (over which we quarreled so viciously last fall) and more than the value, either of our pigs, our corn, our potatoes, our cotton, our oats, or our wheat. Verily, our hens are millionaires, or at least we a millionaire nation, by their efforts.

#### Eggs. "In Spite."

"One of the editors" tells of calling upon several poultry keepers and finding that in most of the houses, the roosting platforms had not been cleaned for weeks. "The hens," he said, "were producing some eggs, in spite of their surroundings." Many people have supposed

that we are past the days when most poultry keepers treated their fowls with such amazing disregard of the value of the dollar. When hens are so kept that they are obliged to lay "in spite" of their surroundings, or out of spite to their ungrateful owners, it is safe to say that the products of spite will not go much farther than to equal the cost of their food.

#### Prevention Rather Than Cure

The proverbial pound of cure required, in the poultry yard at least, is always expensive, and often virtually thrown away. People do not realize that the number of individuals housed together, and the fact that they gather their food from the same ground where they deposit their excrement, multiply the fowls' chances of contagious attack. This is one of the reasons why prevention among poultry is so infinitely preferable to cure. We may put our poultry in crowded quarters, and get, as a result feather-pulling and moping from no exercise; also we may get about the same result, in lazy, vicious, and sickly flocks, if we omit grit and green food, or feed too much corn, we get indigestion and constipation; if we leave them to suffer without shade, and with stale or foul water, we may get apoplexy or diarrhoea, or even so-called cholera; with open draughty houses we get sneezing and throat difficulties which may run into roup; wet floored houses mean cramp and rheumatism. Any and all these mean that the hens are working "in spite of" the owner's neglect, and that he will have to pay for the pounds that cure, if cure there be. And all the ill results noted might have been easily prevented.

MYRA V. NORRIS.

# A WOMAN SAVED.

## A CASE OF INTEREST TO EVERY WOMAN.

### Mrs. Henry Younghans Tells a Story of Suffering and How She Was Cured.

From the Evening News, Detroit, Mich.

Mrs. Henry Younghans, of Detroit, Mich., who resides at 1008 Grand River Avenue, said: "Ever since our last little one came I was an invalid. For years I have had the most painful experience and would have to lie down most of the time. After the last baby was born I was unable to attend to my housework. I could hardly stand up and had dizzy spells. I wanted to sleep all the time and was treated by several of the best physicians. I would have the most fearful cramp, for which hot applications were used. I used these hot applications until I blistered myself severely.

"Before our child was born I had been a strong, healthy woman and was scarcely ever sick. After he was born I grew weak and thin, and received scarcely any help from the medicine left by the doctors. They said I was not properly cared for and that the baby was too strong for me. My back seemed to be breaking and I was scarcely ever without a severe headache. Could not tell you how many different prescriptions I have taken, but every doctor had a different plan of treating my case. I wore supports and laid for weeks with my limbs elevated, but without avail. One day my husband suggested that I try Dr. Williams' Pink Pills for Pale People, as he had read several articles in the paper about women who had been helped by them. I was discouraged and thought I must always be an invalid, but said I would try them after I had taken the bottle of medicine I was then using.

"A few days after he brought me in a box and asked me to give them a trial. I started taking Dr. Williams' Pink Pills for Pale People that day and put the other medicine away, thinking it would please him if I tried the pills. Before I had taken one box I felt better. My husband noticed the improvement and bought two more boxes. I kept on using them until I had taken four boxes, and I was entirely cured.

"I keep them in the house now and use them occasionally, as they are a great help to all women. You would not have known me two years ago. What I am to-day is owing to Dr. Williams' Pink Pills for Pale People."

(Signed) MRS. H. YOUNGHANS.  
Mrs. H. Younghans, being duly sworn, states that she has read the above and that it is true in every particular.

ROBERT E. HULL, JR., Notary Public.  
Wayne County, Michigan.

Dr. Williams' Pink Pills for Pale People are not a patent medicine in the sense that name implies. They were first compounded as a prescription and used as such in general practice by an eminent physician. So great was their efficacy that it was deemed wise to place them within the reach of all. They are now manufactured by the Dr. Williams' Medicine Company, Schenectady, N. Y., and are sold in boxes (never in loose form by the dozen or hundred, and the public are cautioned against numerous imitations sold in this shape) at 50 cents a box, or six boxes for \$2.50, and may be had of all druggists or direct by mail from Dr. Williams' Med. Co.

### The Victorian Roll of Honor.

In our issue of July 10, page 490, we spoke of the institution of the "Victorian Medal of Honor in Horticulture" by the Royal Horticultural Society of England. The list of recipients has just been issued, and is given below. The names of the majority will be familiar to very many of our readers who will appreciate the comprehensiveness of various branches of the horticultural interest and industry thus represented. At the same time we cannot but express surprise at some of the, to us, glaring omissions. No doubt the task of selection was a difficult one, but some whose names do not appear are surely as worthy as the best of those included.

### Obituary.

The wife of Mr. John Hinchman, formerly gardener to William L. Strong for fifteen years, died at her home at East Oceanic, N. J., on Tuesday, July 20. The funeral was one of the largest attended ever seen in the district. There are six children left to mourn her loss, the youngest of which is four years of age. Mr. Hinchman has been in business for himself for the past two years and is very successful.

In the death of William Fowler of Baltimore, the craft loses a good man and thorough gardener. Born December 19, 1822, at Kelvin Grove, near Glasgow, Scotland, he served his apprenticeship at the Botanical Gardens in Glasgow, and graduated at Kew in 1848. In the same year he came to America and settled in Virginia. The British government appointed him to collect specimens in Australia, where he spent nearly four years in gathering one of the largest collections now in Kew Gardens. After returning from Australia, he came to Baltimore and was engaged by the late John Hopkins upon the Clifton estate, where he remained for forty years. It was the intention of Mr. Hopkins to have the University bearing his name established on the Clifton ground, and at the same time have Mr. Fowler plan and lay out a botanical garden, but through the untimely death of Mr. Hopkins, the plan fell through.

Many rare specimens of trees now at Clifton were planted by Mr. Fowler, and the cutting down and grubbing out of

the same during the last year grieved him very much.

Acacias and other New Holland plants were his favorites. Conifers also were great pets of his, and Clifton has a fine collection.

### Toronto.

The Toronto Gardeners and Florists' Association had an excursion to Niagara Falls Park on Tuesday, the 13th inst. About 50 members and friends took the trip. The party was guided by George Vair, and had a most enjoyable time. Mr. Vair had lately been over the ground, and by his kindness we were able to see about all it was possible to see in one day. Niagara Glen was the first place we stopped at. Our party spent nearly two hours in the glen and most of them expressed their thanks to Mr. Vair for showing them this new attraction to Canada's best known park. After leaving the glen we went to the main part of the park where we were met by Mr. Cameron, the genial and able gardener, who showed us over the most interesting parts. The park proper was quite a revelation to several of us that had not been near it for ten or twelve years. Since Mr. Cameron took charge the place has been entirely changed. All its natural beauty has been preserved wherever possible, and where improvements have been found necessary they have been made in such a way as to be as much as possible in harmony with the surroundings. The Dufferin Islands have been opened to the public, and rustic bridges have been made, connecting all of the islands.

### Holyoke, Mass.

The annual sweet pea show at Mountain Park the 21st and 22d inst. was a very pretty affair. It was a free exhibition given as an attraction to the park, yet it was a credit alike to the exhibitors and to the manager of the show, C. M. Hartzell. Mr. Hartzell's display comprised 120 named varieties, including several of the 1897 sorts. Of these novelties Countess of Powis was very pleasing. R. S. Houston made a very attractive exhibit, arranging his flowers with foliage, greatly improving their appearance.

Of the out of town exhibitors, J. W. Eldred and Rev. W. T. Hutchins, of Springfield and D. W. Brainard, Thompsonville, Conn., were the most extensive. Mr. Eldred's Lovely is certainly a lovely flower. Mr. Hutchins had several very pleasing vases of the new-r sorts, among them Maid of Honor, which, so far, does not come up to the older varieties of about this color; Lottie Eckford is much better. The sweet peas from Mr. Brainard were all good commercial sorts. Sweet peas were also shown by several amateurs. No prizes were awarded.

### American Dahlia Society.

This society has issued its schedule of prizes in connection with its second annual show. The exhibition is to be held under the auspices of the Pennsylvania Horticultural Society, in its new hall, Broad Street, below Locust, Philadelphia, commencing on the third Tuesday of September (21st) next, and closing on the following day.

In addition to the awards for dahlias, special prizes will be given for summer flowering bulbs, cannas, ornamental plants and cactus.

### Boston.

The exhibition at Horticultural Hall on July 17 was rather slim so far as effect was concerned, owing to the severe gale of the few days preceding. The prizes for hollyhocks had been put off from the preceding week, but were only awarded in part. M. H. Walsh, gardener to the estate of Hon. J. S. Fay of Woods Holl, received all the awards that were made, his display covering one end of a small table, where two or three years ago it was an easy matter for the same exhibitor to fill a table the whole length of the hall with beautiful specimens and at the same time have a liberal competition. The prizes for gladiolus

were generally competed for, and Kenneth Finlayson, gardener to Dr. C. G. Weld, carried off the honors by taking the first and second prizes. James Greene, gardener to James L. Little, Esq., received the third prize, and there were other exhibits of which the growers may be proud. James Greene was first on tuberous begonias, second not awarded, and the third to D. F. Roy, gardener to Hon. E. S. Converse. Carl Blomberg made a creditable display of hardy aquatics including among other interesting specimens, *Nymphaea alba rosea*, a native of Sweden, which has seldom bloomed in this country, and *N. Martiana fulgens*. Added to this was a fine display of native American ferns and several complete collections of native flowers.

#### A Royal Orchid Bouquet.

The "Gardeners' Chronicle," London, in its issue of June 26, editorially comments as follows on the bouquet ordered by Her Majesty the Queen, for the decoration of the dining-room at Buckingham Palace on Jubilee Day. The flowers were furnished by F. Sander & Co., St. Albans, England:

"The framework of the bouquet consisted of a basket made of wicker-work, heavily gilt, standing on a polished mahogany base; in shape trifoliate, beautifully fluted and worked. From the three corners spring the handle, its three branches forming a dome, surmounting the top of which is a royal crown, the letters 'V. R. I.' twelve inches in length, being arranged beneath the crown, which consists of several hundreds of flowers of *Odontoglossum citreolum*, the letters being composed entirely of the orange-colored *Epidendrum vitellinum*, Millais' favorite orchid. It is impossible to attempt the description in detail of the many thousands of orchids used in this, the most superb bouquet ever seen, endless spikes of all that is best and rarest from Her Majesty's dominions being used, together with almost priceless blossoms of the hybridist's art raised in this country since our Queen's accession, many of them unique and of great value, among the choicest varieties being *Cattleya Empress of India*, *C. Our Queen*, and *C. Victoria Regina*, which received awards at the meeting of the Royal Horticultural Society on the 15th inst. The Princess of Wales *Odontoglossums* were prominent in magnificent pure white spikes, as also were Lord Dalhousie's *Dendrobe*, with its nankeen-yellow and maroon blossoms. The sprays of the *Disa* from Table Mountain; *Stenoglottis fimbriata longiflora*, also from South Africa; the moth-flowered *Dendrobe*, from Australasia and British New Guinea; *Vandas*, from the British East Indies; *Cattleyas* and richly-colored *Oncidiums*, from British Guiana, and the lovely scarlet *Epidendrum vitellinum* and *Lælia xanthina*.

"Among the more rare species and varieties employed, mention may be made of the white *Sobralia leucantha*, the beautiful hybrid *Phalopus Owenianus*, *Vanda teres Hookeri*, the white-pouched variety of *Cypripedium Godfreyae leucochilum* var. *Godfreyana*, an importation possessed only by Mr. R. H. Measures, of orchid fame; the Luxembourg variety of *C. caudatum*, *Dendrobium Phalaenopsis*, the spikes of which are admirably adapted for bouquet-making; *Oncidium Batemannianum*, with its beautiful yellow expansive lip and brown crest; *Calanthe Laucheana*, a cross between *C. Sanderiana*, and *C. veratrifolia*, the flowers colored lilac and white; *Cattleya Harrisoni*, *Masdevallias*, chiefly varieties of *Harryana*, and a few *M. Chimera*.

"The handles of this magnificent basket of orchids were fitted with flutes or sockets, and the flowers were placed in them, with the spikes entire, and, in very many instances, the whole bulb and leaf also. The interior of the basket, which had to be specially designed and constructed for the occasion, is one central dome, forming a solid founda-

## THE BEST HANDY MICROSCOPE FOR THE FLORIST!

### ...A CODDINGTON MAGNIFIER...

The applications of science to practical horticulture are to-day so numerous as to need no pleading for recognition, and the cultivator who is alive to facts knows that disease can be fought most thoroughly, and with the minimum of labor, only by going to its inception—in short the battle must be declared just so soon as the disease has a foothold. Continual alertness is the only safeguard, and a grower should be in a position to at once thoroughly and minutely examine into all suspicious marks or spots and not wait until the manifestation was all too evident.

All things have small beginnings, and in order to detect disease, artificial aid is frequently a necessity, thus all should carry a convenient

### ...POCKET MICROSCOPE...

to examine suspected cases of fungous or insect pests at once.

Nothing can be better adapted for this purpose than a Coddington Lens, suitably mounted. This lens is solid, and thus not affected by change of temperature, consequently admirably adapted for the purposes for which we offer it.

The accompanying illustration represents a lens, mounted in German Silver, which we offer at \$2.50 each; they can be had in various powers, from a one-half to a two-inch focus, but for all general purposes (and the one we use ourselves,) the most adaptable is that known as a one-inch focus. It gives a magnification of 10 diameters, and is more easy to work with as it allows a greater distance from the lens to the object than does a lens of higher power; by this means a better light can be brought to bear on the object, and also the field of view is not so restricted.

We will mail this Coddington Magnifier, of the best possible construction, and made with great care throughout, one-inch focus recommended, with a power of ten diameters, for \$2.50 cash with order. If instrument is not satisfactory purchase price will be refunded if instrument is promptly returned in good order.

We can also supply a very effective pocket magnifier, half-inch focus, flat field, at the low price of \$1.25, postpaid. Address all orders to

**A. T. DE LA MARE PTG. & PUB. CO. Ltd., P. O. Box 1697, NEW YORK.**

tion, supporting the whole mass of blossoms, which, perfectly finished and arranged, had a height of eight feet, with a diameter of six feet. The number of flowers in the bouquet in 1887 was 50,000, but this huge trophy contains a larger number, while the quality

is better, and rarity greater; and by command it was delivered at Buckingham Palace on Monday afternoon. The bouquet, on the termination of the court dinner, was carried into the Queen's boudoir, which it served to adorn for several days."

# WHOLESALE MARKETS.

## New York.

Business generally has been depressed for a week; this is, no doubt, largely due to the precarious weather. It is only with difficulty that the market clears and then only at low figures.

The chief crop to suffer is melons which are a complete drug and not paying expenses; three dozen melons for 75c. was a fancy figure in the middle of the week, this figure would nearly all be absorbed when shipping and other charges are taken out of the total. In appearance the crop is all right, but the flavor is questionable.

Another crop that is in a poor way is tomatoes, owing largely to the unripe and poor appearance of the same.

Georgia peaches have been light in supply, and last week's figures have been fairly well maintained for fancy quality. A few Vineland peaches are in the market, and sell for about 50c. per basket.

Blackberries are light in receipt, with stock in poor condition, owing to the wet weather, and prices rule low, 4c. per quart being the highest possible, but the bulk does not average the half of that.

Apples—Near-by, hand-picked, per barrel \$1.50@2.25; near-by, windfall, per barrel, 50c.@\$1.25; Southern, hand-picked, per barrel, \$1@2; Maryland and Delaware, good to prime, per crate, 50@60c.; common, per crate, 25@40c.

Peaches—Georgia and South Carolina, fancy, per carrier, \$2.25@3; good to cheap per carrier, \$1.25@2; poor to fair, per carrier, 50c.@\$1; Virginia Troths, per carrier, \$1.00@1.50; Maryland and Delaware, early, per crate, 75c.@\$1.25; early, per basket, 50@51.00; Jersey, early, per basket, 40@75c.

Pears—Le Conte, Southern, poor to fancy, per barrel, \$1.50@2.75.

Grapes—Delaware, per 25-pound case, \$1.50@3; Niagara, per 25-pound case, \$1.75@2.25; Moore's Diamond, per 25-pound case, \$1.75; Moore's Early, per 25-pound case, \$1.50@1.75.

Cherries—Eight-pound baskets, as to size and condition, 20@35c.

Currants—Large, red, per quart, 2@4c.; bulk stock, per pound, 2@3c.

Blackberries—Monmouth Co., Jersey, Wilson, per quart, 1@5c.; South Jersey, cultivated, per quart, 1@5c.; Maryland and Delaware, cultivated, per quart, 1@4c.

Huckleberries—Shawangunk Mountains, per quart, 6@8c.; Pecono Mountains, per quart, 6@7c.; Other Pennsylvania, blue, per quart, 5@7c.; Pennsylvania, per eight-quart basket, 50@60c.; Jersey, per quart, 4@6c.; Delaware and Maryland, per quart, 8@5c.; Virginia, per eight-quart basket, 30@40c.

Raspberries—Up-river, red, per pint, 1@5c.; per 8-to-quart cup, 1@4c.; four-to-quart cup, 1@3c.; Upper Jersey, red, per pint, 1@4c.; Lower Jersey, red, per pint, 1@3c.; blackcap, per pint, 1@4c.

Melons—Watermelons, fair to choice, per car, \$125@175; common, per car, \$75@100; medium to large, per 100, \$15@25; small, per 100, \$8@12; muskmelons, Maryland Gem and J. Lind, carrier, \$1@1.75; Norfolk Gem and J. Lind, barrel, \$1@1.50; Norfolk Gem or J. Lind, carrier, 50c.@\$1; Norfolk and North Carolina, bushel basket, 40@75c.; Norfolk and North Carolina, per barrel, carrier, 50c.@\$1.25; Norfolk, Christina, per barrel, \$1@1.75; Baltimore, Gem and Lind, basket, 75c.@\$1.

Celery—Fair to prime, per dozen, 20@50c.; small and poor, per dozen, 5@15c.

Corn—Near-by, Jersey, per 100, 75c.@\$1.25; South Jersey, per 100, 50@75c.

Cabbages—Jersey and Long Island, per 100, \$2.50@3.

Cucumbers—Jersey, per barrel, \$1@1.25; Jersey, per bushel box, 30@40c.; Norfolk, per barrel, 50c.@\$1; pickles, Jersey and Long Island, per 1,000, \$1.50@2.50.

Egg plants—Jersey, per basket, \$1@1.50; Jersey, per bushel box, 75c.@\$1.

Green peas—Western New York, per bag, \$1.50@2; Long Island, per bag, \$1.25@1.50.

Lima beans—Maryland, per one-half barrel basket, \$2.50@3; Jersey, per bag, \$1.50@1.75.

Onions—Maryland, per one-half barrel basket, 70@80c.; eastern shore, per one-half barrel basket, 65@75c.; North Carolina and Virginia, per barrel \$1.50@2; Jersey, white, per barrel, \$3@4; Jersey, white, per basket, \$1.25@1.75; other Jersey, per barrel, \$1.50@2.25; Orange County, red, per barrel, \$1@2.25.

Peppers—Jersey, per crate, 60@75c.

Radishes—Local, per 100 bunches, 75c.@\$1.25.

String beans—Long Island, per bag, \$1.50@2.

Squash—Marrow, per barrel crate, 75c.@\$1.25; yellow crook-neck, per barrel, 50@75c.; white, per barrel crate, 50@75c.

Tomatoes—Monmouth Co., Jersey Acme, per crate, 75c.@\$1.25; other Monmouth Co., Jersey, per crate, 40@75c.; south Jersey, per crate, 30@50c.; Philadelphia, per basket, 25@30c.; Maryland, per carrier, 40c.@\$1; Baltimore, per one-third baskets, 50@75c.; Norfolk and North Carolina, per carrier, 25c.@\$1.

Turnips—Russia, per barrel, 50@75c.

## Boston.

The market is well supplied with cantaloupes, coming mostly from Virginia. Every variety grown in that state seems to be in some of the barrels, and if not all in one barrel, all seem to be in one shipment from one farmer to one commission house. Price ranges from \$2.50 down to \$1.50 a barrel, with all the good eating kinds finding very good sale at \$2.25@2.50.

Watermelons, healthy demand, 20@22c., some fancy large held for more money.

The few dealers who receive hothouse cantaloupes are having a fine time. It is one of those occasions when the quality of hothouse stock can be guaranteed; home-grown stock bringing 25@75c. each, while some Montreals bring \$1@1.50 each; readers must not, however, get excited over these figures because they are rather fancy prices at a peculiar season of year, and the dealer, as every other wide awake man should do, is taking advantage of the opportunity.

High-colored marrow squash in good demand at \$1.50 per barrel. Pale hard to be placed at any figure.

The duldest currant market ever seen in New England is now about closing with stock offering at 1@2c. per pound.

Red raspberries are about over, holding up in price, 8@5c. for thirds, Hudson River stock; while some near by bring 8@10c. a pint.

Blackberries are not appearing in large quantities, and sell all the way from 8@10c.

So much rainy weather keeps the girls from picking blueberries, therefore, no large receipts, and a range of prices from 10@14c.

Nova Scotia strawberries bring 10@18c., according to condition when arriving and their keeping qualities. It is a long way to send them, and the conveniences are not perfect.

Homegrown potatoes are firmer, about \$3 per barrel; stock is excellent, and yield said to be fairly large.

Few Virginia white sweets bringing \$4 a barrel.

Pear trees of this section are showing up well laden with fruit.

There is a large demand for pineapples, most of the stock coming running small sized, and yet commands very good figures, 6@7c. for 36 counts, 8@10c. for 30 counts, 11@12c. for 24 counts.

Some Georgia Elberta peaches are offered at \$2@2.25 a crate.

Native string beans, \$1 a bushel; shell beans, \$1.25 a bushel; peas, 75c.@\$1 a bushel.

Hothouse cucumbers, 2½@3c. each; field cucumbers have not made any progress this year, and the crop is way behind time; apparently the worst season in our remembrance.

Hothouse tomatoes in good demand at about 15c. a pound; while Virginia stock is plentier, but has not so quick a sale at \$1 per bushel.

New carrots look exceedingly nice on

the counters with their green tops and invite purchasers at 50c. per dozen bunches. Gooseberries about gone. Asparagus, \$1@1.50 a dozen; egg plant, Florida stock, 75c.@\$1.50 a box.

Round radish steady at 20c. a dozen; lettuce at 30c. a dozen; summer squash firm at 50c. a dozen; cabbage, good sale at 4c. a head; turnips, 75c. a bushel; beets mighty plenty at 40c. a bushel.

The South Carolina grapes are just about as plenty as their quality brings a demand; they are not quite as well colored this year as some seasons. Moore's Early, \$1.50 for the seven-basket carrier, with Delaware finding a slow sale at \$2@2.25.

Black Hamburg grapes range from 50c. to \$1 per pound.

Mushrooms bring \$2 per pound. Readers, however, must understand that fewer are wanted at this season of the year, and when an order comes, the party is willing to pay a good round price to get them; might generally be termed hard to find.

Rhode Island green corn easily brought 16½c. per dozen at the beginning of the week.

Onions, Ohio barreled stock, \$1.75@2. Peppers selling 40c. a dozen.

## Philadelphia.

The late heavy rains which have been general throughout the country have had a bad effect upon fruits and vegetables, and although shipments continue to be heavy, the quality is not up to standard. Everything has cleaned up well, but prices, as a rule, are low.

Apples—Jersey hand-picked, \$2@2.25 per barrel; windfall, 75c.@\$1 per barrel. Delaware and Maryland, good, per crate, 60@80c.; fair to good, 35@50c. per crate.

Shipments of peaches are daily increasing, but there is not a large quantity yet arriving in this market; so far, nothing but Georgia fruit has been seen. Fancy, well-colored fruit has sold for \$3 per crate, while the general price has been \$2.25@2.50 for good fruit; fair to good, \$1.75@2.

Pears—Le Conte, fancy, from Georgia, \$3.25@4 per barrel; per basket, 75c.@\$1.

Corn—Jersey, per 100, 65@80c.; fair to good, 40@50c. per 100.

Cabbages—Jersey, fancy, \$2.75@3.50; fair to good, \$2@2.50.

Jersey cucumbers are now arriving in large quantities, and prices have fallen to 30@40c. per basket for good stock; with fair to good, at 15@25c. Norfolk, per barrel, 75c.@\$1.

Egg plants—Jersey, per bushel basket, 60@75c.

Onions—Jersey, five-eighths basket, 40@50c.; Maryland, one-half barrel box, 75@90c.

Peppers—South Jersey, per crate, 50@75c.

Squash—White, bushel, per barrel, 60@75c.

Marrow—Per barrel, 80c.@\$1.

Tomatoes—Jersey, fancy, per five-eighths basket, 70@80c.; fair to good, 40@60c. Excepting the first grade, most of the stock is not inviting, so large a proportion being unripe.

Potatoes are holding firm at from \$2.25@3 per barrel.

**California Fruit for Europe.**—The first consignment of California green fruits to Europe this season was made from Sacramento at midnight Tuesday, June 29. It consisted of six car loads. From this time forward shipments of this character to the East will be made regularly on passenger schedule. It is calculated to have the shipments in London twelve days after shipping.

**DWYER'S SUMMER and AUTUMN LIST**  
Of Pot Grown and Laver STRAWBERRY Plants, CELERY, VEGETABLE Plants, FRUIT Trees and ALL NURSERY STOCK will be mailed free to all who apply for it.

**T. J. DWYER, Cornwall, N.Y.**  
Box 175.

Mention American Gardening when you write.

## Questions Answered.

This is a Bureau of Information, to which subscribers can apply freely for advice on any and all subjects in the field of horticulture.

In order to lessen labor, and that the Editor and his friends may understand each other, the following rules must be observed:

### Rules for Correspondents.

Questions must be concise, plainly written on one side of the paper only, and addressed INQUIRY DEPARTMENT, AMERICAN GARDENING, P. O. Box 1697, New York City.

Letters appertaining to subscriptions, or other business matters, should be directed separately; otherwise delay may follow.

The name and address of the sender is required, in addition to a nom de plume. Use a separate sheet of paper, not a scrap, for each question. Questions will be attended to without delay. If by mistake a query fails to be answered, it should be repeated.

Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.

Questions relating to insects or diseased plants should always be accompanied by specimens, packed in a tin box, and forwarded at letter postage. Always send a liberal sample.

Conditions and soils vary so infinitely that we would be pleased to have our correspondents describe theirs.

Correspondents referring to articles which have appeared in AMERICAN GARDENING should mention page and date of issue.

We cannot promise to comply with requests to answer by mail.

We cannot undertake to reply by mail.

### Boston Ivy.

I have some fine vines of Japanese Ivy, growing nearly to the top of the house. But the leaves are for the most part large and coarse, so that they are almost without the distinctive beauty of the finely and delicately-leaved vines I see every where in town on churches, etc. Can you suggest any treatment of the roots which

would change the habit of my vines? They have not been unduly manured—not at all for two or three years.—H. B. C.

—Your vines are evidently luxuriating in congenial soil and favorable conditions. Time and further growth, with lack of attention—starving, in fact—will ultimately bring about the appearances you desire.

### Stem-Weevil in Amaranthus.

I am very much grieved to find my large bed of Amaranthus, which was doing so well and making a fine show, is dwindling away to nothing. Some grub has attacked the roots, and each time I pass the bed I find another large plant lying prostrate, with all the roots eaten off, and the grubs an inch or two up in the heart. I send you a section with the worms in it.—E. C. R.

—The grub attacking E. C. R.'s Amaranthus is the larva of one of the so-called "stalk-weevil" (Curculionidae). Which one of the numerous species of stalk-weevil cannot be definitely determined until the adult beetle can be reared. Most of the stalk-weevils attack plants in such a manner that it is impossible to destroy them without destroying the plants. All that E. C. R. can do this year is to pull the infested plants and burn them. It is to be hoped that after determining which species it is that is attacking the Amaranthus, we may be able to suggest some other plant to be planted with the Amaranthus as a trap plant, that is, some plant for which the weevil has a preference, and which can be pulled and burned after the weevil has deposited its eggs in it.—F. A. S.

### Uprooted Apricot.

I have a tree of Moor Park apricot, eight years old. It was blown over last October, and I propped it up; this spring it was full of blossoms and now carries a heavy crop of fruit. Can this tree be

transplanted, or would it be better to get another tree? It must be moved from its present place.—A. C. E.

—The safest plan will be to procure a new tree, owing to the age of the present one, otherwise the fact that the tree was partially uprooted a year ago would help materially in the proposed transplanting this fall or next spring.

### Seedling Pansy.

(To D. M.)—The Pansy sent does not possess any feature that would distinguish it specially from others we have seen before. The color is dull and the form not of the best.

### Wintering Papyrus.

Is it possible to keep the roots of Papyrus antiquorum over during the winter? I have not succeeded in doing it as yet.—E. T. H.

—Papyrus antiquorum can be safely wintered over, both small and large plants. If large plants or clumps be lifted in the fall they may be placed in tubs or half-barrels and kept in the greenhouse, or large plants may be planted in the border of a rose house. Plants in four or six-inch pots may be placed on the benches or tables and treated like Cyperus alternifolius; Papyrus winters best under these conditions, not submerged or deluged with water, and in the full light such as a rose house affords. If too cold and wet the plant will rot. Minimum temperature 60 degrees.

### Growing Lily Bulbs.

Is South Central Kentucky far enough south to grow Lillum Harrisii successfully. How long does it take to grow the bulbs to salable size.—REAM.

—So far as our information goes, we do not believe that your district is specially adapted to the propagation of Lillum Harrisii, but, of course, you are the best judge of that. Two or three years are required to develop large bulbs.

TO BE PUBLISHED AUGUST 20.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

This work will contain nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo. Price, \$1.50.

THIS volume, which has been prepared by the foremost aquaticulturist of the country, and to whose efforts the present increasing popularity of the Water Garden is largely due, is intended to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The work should find a place in every library and in the home of all gentlemen interested in gardening; it will prove indispensable to the private gardener, whether he is at present cultivating an aquatic garden or with a view of preparing himself to take charge of one at any moment. It is scarcely necessary to dwell on the value of the book to the commercial man; every one in trade will require it.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A full descriptive list of Nymphaeas and all other water plants, as well as of all trees, shrubs, etc., adapted for marginal effects, is included.

— ORDERS RECEIVED NOW. —

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

**Columbines are Perennial.**

(To C. A. L.)—The Columbines (*Aquilegia*) are all perennials, but may possibly be treated as annuals in some instances. The most satisfactory way, however, is to treat them as biennials. See article on page 439.

**Clematis Questions.**

—(1.) What is the best method of inducing the common large flowering Clematis to grow more compactly than is its ordinary habit? Can this be done by pinching off the ends of the leading shoots?

—(2.) What is the best fertilizer for Clematis growing in a heavy black soil, and when should it be applied?

—(3.) Suggest a list of Clematises designed to give continuous bloom from early spring to late fall.—CHICAGO.

—(1.) It is a difficult matter to change the habit of Clematis and derive any benefit therefrom by pinching the leading shoots. There are so many Clematises of different types that might be called "common large flowering Clematis," that a definite answer to the question would be misleading. Some types (patens and florida) flower from wood of the year before, and, as a rule, do not have live wood enough in spring. While lanuginosa and Jackmanni types flower on the current summer's growth, this should be trained rather than stopped.

(2.) The best fertilizer is a heavy dressing in the autumn, of rotten barnyard manure. If the soil, when dry, be very compact, work in some sand.

(3.) A small collection should include the following: In shrubby kinds, *Integrifolia*, *tubulosa*, *Davidiana* (blue), *erecta* (creamy white), *Pallasae*, and *stans* (white). In climbers, *Albert Victor*, and *Mrs. James Bateman* (lavender), *Fair Rosamond*, *Duchess of Edinburgh*, and *Henry* (for white), *Earl Beaconsfield*, *Jackmanni*, *Prince of Wales*, and *Louis Van Houtte* (purple), with *lanuginosa* and *Belle of Woking*. Of the small flowering kinds, *virginica*, *crispa*, *graveolens*, *viticella*, *paniculata*, and *vitalba*.—J. H.

**Small Celery Plants.**

I have two or three flats of young celery plants one to two inches high, seemingly too small for planting for this year's growing. Can I keep over winter in cold frame or cellar to be set out in garden next spring?—A BEGINNER.

—It is not too late to plant celery out in the garden; it will yet make serviceable heads. If it were possible to keep it over in the way suggested, it would be useless.

**Quinces Diseased.**

(To T. E. B.)—The specimens sent show that your trees are attacked by the Orange Rust (*Roestelia aurantiaca*). The bright orange-colored pimples are the ruptured spore cups from which the millions of spores escape to carry on the life of the fungus. Do not delay a day in removing and burning thoroughly all infected fruit and adjacent parts if necessary. The fungus causing the rust is one of that very interesting group of parasitic fungi which have alternate generations on different hosts, the alternate host in the case of the quince rust being a juniper or wild cedar, where it appears first as a slime. (See paragraph and fig. 150 entitled "Apple Rust.") Very early spraying may mitigate the evil another year, but if the other host can be destroyed, the remedy is sure.

**Cherries and Plums, Not Bearing.**

Will you give some instructions as to time and method of pruning for fruit, young cherry and plum trees? And also how to keep on the tree any fruit it may form. I have young trees, of good size and in vigorous condition which either bear nothing, or lose very early what little fruit they have. They are in gravelly loam, well drained, with a little slope to the south; they get a yearly dressing of wood ashes, and are properly cultivated, and the foliage is abundant.—WEST VERMONT.

—West Vermonter should have cherries, provided the trees are old enough, and

are sprayed in proper season. The trees in general, need no pruning except perhaps, for the two first years after planting (see instructions in "The Fruit Garden" for February 27, and also in this issue). Lacking detail, it seems strange about the plums not cropping, age and vigor are there, the soil, too, is passable. It looks as if *cucullo* had something to do with the fruit dropping. Fertilizer is not necessary while the trees are making vigorous growth and no crop. It might have shed some light if the age and varieties had been mentioned. The subject was covered in detail in "The Fruit Garden" for January 28 and March 6, and a reference to those issues might help "Vermont" a good deal.

**Strawberries for Christmas.**

In your editorial of June 5, you speak of a New Jersey grower who marketed his first strawberries four days before Christmas. As you stated his method of growing is not touched upon by any of your correspondents, would you give his way, if obtainable.—Fr. S., Springfield, Mo.

—The grower referred to makes a great secret of his work; therefore, we are not in a position to make known his entire method. He grows his plants entirely on benches planted out and not in pots, as is usual with most growers. Having been at it many years, he has succeeded in reducing it to a system whereby he ripens the plants and starts them again so as to come on in batches. A number of houses are devoted to strawberries only. The bench plan demands exclusive use of space, and much attention, especially during the growing and fruiting months. Mildew and red spider are the special foes. If much moisture exists, mildew is apt to attack the plants; should they be kept on the dry side, red spider is liable to cause trouble, so that great dangers exist unless a careful balance is maintained. Otherwise the same treatment is as detailed in our issue of June 5.

**Plants Named.**

(To R. E. P.)—The Rose sent is, we think, Queen's Scarlet, sent out by Hall and Thorpe in 1880.

**The Editor in the Garden.**

The following remarks from a farm contemporary have their bearings in other quarters. For "farm" and "farmer" read "garden" and "gardener":

There is a certain class of farmers who have funny ideas as to the relation the farm editor has to the farm. They think he should be a farmer himself in the sense that he lives on his farm and fertilizes it with his own sweat. They fail to see that this is a total and absolute impossibility; that the editing of a farm paper requires all the time and study that any one man is competent to give, and that the running of a farm successfully makes the same requirement; and that no man is competent or can begin to be competent to do both at the same time. A farm does not furnish the facilities for the editor of a great agricultural paper. The editor must have the full use of the mails, of clerical help, must be where people can find him, and to edit the paper on the farm is not to edit it at all in the full sense of the word. The farmer may be a regular contributor to the pages of an agricultural paper and may do some of the best work that is done on the paper, but to contribute regularly to the columns of a newspaper is one thing; to edit it is another and entirely different thing. Ten men can be found to do the first where one man can be found to do the second. To require, therefore, that the editor of a farm paper must live on the farm and plow and sow and reap while editing the paper is to require an absolute impossibility. No man, so far as we know, has ever done it, and it is safe to say that none ever will.—Wallace's Farmer.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send a stamp for our new catalogue.

**AGENTS WANTED.**

Read this partial description of the best book of the kind for women which has ever been published, then write us for terms and territory.

**HOUSE PLANTS**

AND

**HOW TO SUCCEED WITH THEM.**

BY

LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when noting with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to be far beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"HOUSE PLANTS" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "HOUSE PLANTS" will take its position second only to the much prized and ever handy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fail.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done, if my instructions are followed."

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. These silent monitors, the flowers, are so dumb, but speak to us through the delicacy of their scents, their intricate shapes, complex habits, and the glorious penning of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is an index of our subscribers' interest in the paper.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call to push circulation. Understanding thoroughly the value of the paper to every one interested in gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER PREMIUMS SUMMER

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us AT LEAST one new subscriber before the close of the season.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only seven new subscriptions at \$1.00 each.

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Beautifying Country Homes.** By J. WEIDEMANN. A handbook of landscape gardening. This is the most elegant and useful work on the subject ever issued in this country. It is beautifully illustrated with numerous fine wood engravings, and with 17 full-page and 7 double-page colored lithographs of places already improved. It contains general directions for lawns, roads and drives, walks, hedges, trees and shrubs, gardens, ornamental grounds, hints on burial lots, etc., etc. The beautifully colored plans of improved places are accompanied by descriptions giving the names and positions of the various trees and shrubs employed in planting, thus providing a complete planting map. Cloth, 4to. Reduced from \$15.00 to \$10.00.

*Given for 20 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. Handsomely illustrated, cloth, 12mo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Canning and Preserving Fruits and Vegetables, and Preparing Fruit Pastes and Syrups.** By ERMENTINE YOUNG. This work gives a full account of the best methods by which the surplus fruits may well be saved for home use and for the large market demand, and a handsome profit accrues

to the home workers. A practical chapter on evaporation of fruits is embodied in the book. Paper, 20 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases, dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo., cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit and Fruit Trees of America,** or the culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. By A. J. DOWNING. Second revision and correction, with large additions. By CHARLES DOWNING. This work has no equal in the country, and deserves a place in the library of every pomologist. It gives descriptions of all the finest varieties of fruit, native and foreign, cultivated in America, and contains the names and synonyms of over 10,000 varieties. Over 1100 pp., with several hundred outline engravings, including supplements. 8vo., cloth. \$5.00.

*Given for 12 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**INCUBATORS.** Self-regulating. Catalogue free

# A YARD OF ROSES.

Copyright, 1896, by O. D. Gray, New York.

The illustration but faintly represents the beauty of this celebrated painting by the well-known artist, Mr. Newton A. Wells. The grouping and coloring has been performed with exquisite taste, and the reproduction we offer is worthy a frame, and a position on the wall of any one's room. This sketch, in eleven colors, is 36 inches long and ten inches wide, on heavy drawing paper, and sells in the art stores of New York for fifty cents. We will send "A Yard of Roses," securely packed in a tube to prevent injury, postpaid, as follows:

To all renewing their subscription and adding five cents to pay postage and packing.

To all sending us \$1.00 for their own renewal subscription and 75 cents for the subscription of a friend, we will send "A Yard of Roses" free and postpaid, as a premium to both addresses.

## Heating the Lily Pond in Prospect Park.

To all lovers of flowers, the Lily ponds in Prospect Park, Brooklyn, N. Y., are now a point of interest. A space has been laid out in the park for three ponds, which are walled up with concrete and provided with a water supply and an outlet. One pond is used for the hardy native Water Lilies, another pond is exclusively used for the Egyptian Lotus, while the third pond, which is of absorbing interest to the multitudes who visit the park, is used for tropical species, the principal plant being the *Victoria regia*, although the pond contains other Water Lilies from the Amazon and Orinoco Rivers, and also the Water Poppy. In order to grow these

pond and piping is shown in fig. 153 from which it will be seen that the sides of the pond slope inward to the bottom, commencing at a point about 2 feet below the surface. A water line is maintained about 3 feet 6 inches above the main bottom, and the pond holds approximately 48,000 gallons. The water is heated by a No. 10 Invincible hot-water boiler, which presents a grate surface of about 11 square feet, and the boiler is rated to carry about 2,500 square feet of direct radiation for heating buildings. The piping is 4 inches in size, of the greenhouse castiron variety, with greenhouse fittings and rust joints. Two flow and two return mains are taken from the boiler to the piping in the tank. The flow mains rise from the side of the boiler, which is of the sectional type, and run on

FIG. 152.—BRANCH OF CORDON TRAINED CURRANT. (See page 155.)

flowers it is necessary that the water shall be artificially heated even during the summer months. We are enabled, through the courtesy of the editor of the *Metal Worker*, to lay before our readers the following details and accompanying illustrations of how the necessary heating is accomplished.

A plan of the tropical Lily pond, showing the location of the heating apparatus and the piping, which was designed and installed by John A. Scollay, 74 Myrtle avenue, Brooklyn, N. Y., is shown in fig. 154. The water in the pond is heated by contact with the piping through which hot water is circulated from the boiler. The pond is oval in form, 56 feet long, 38 feet inside, and about 4 feet deep. A sectional view of the

a brick foundation inclosed in a wooden box to the Lily pond.

On reaching the pond the two flow mains have a standpipe, which serves both as an air vent and an expansion pipe. From this point the piping has a fall all the way back to the boiler. After passing the standpipe the flow main drops down and runs around to a point near the main Lily bed where it connects with a Y, from which two 4-inch pipes are run around the pond, turns being made by means of 45 degree ells, as shown. On reaching the point where the return main leaves the tank, the two 4-inch pipes are connected into a Y and from it to the return main. This method of piping is followed in each end of the pond

The requirements laid down by the Park Commissioners were that a temperature of 90 degrees should be maintained in the water, regardless of the temperature or amount of water that it might be necessary to turn into the pond. The fires were first lighted June 2. The water, which had been taken from the street mains to supply the pond and change the water in it, has varied in temperature from 40 to 50 degrees, and the specified temperature in the pond has been readily maintained, sometimes running as high as 96 degrees when the weather was bright and clear and the sun strong.

When an outlet at one end of the pond draws off the hot water to reduce the temperature, cold water is brought in to restore the proper temperature and level.

An overflow pipe is provided at each end of the pond to prevent the water rising above the desired height. In operation it has been found that it is only necessary to attend to the fire in the boiler twice a day, and in damp, dull and cloudy weather, when little heat benefit is derived from the sun, no difficulty has been found in maintaining the temperature at 90 degrees or higher, with the water in the flow main seldom exceeding 120 degrees. The water in the pond is heated by contact with the pipes, in order to avoid a deposit of mud in the boiler that would be probable, owing to the earth for the plants in the pond and the dust that would blow into the pond and settle, and which would be carried into the boiler with the water in circulation.

## The Vegetable Garden.

Beets sown now will be nice and young for winter use; the largest may be kept for culinary purposes, and the smaller ones set apart in a cool place and covered with earth, will be useful in spring to set out in the garden for early greens and beets. This is the quickest method of securing early beets in spring.

**Celery for Winter.** If planted out during the past unprecedented wet weather, would now be starting finely into growth, for the late period has been ideal celery weather. It is now time to have set out all that it is intended to plant, and if not already done, attend to the matter as soon as possible.

**Endive** is one of the best of salads for fall and early winter use, and the present is now a good time to plant for these purposes. Those requiring much salad should grow lots of endive, as it is of easy cultivation, and is also very pretty for garnishing.

**Spinach.**—Now is a good time to make a sowing of this for fall use. Sow on rich ground. It is a fine crop to follow an early crop, and is much appreciated when gathered young.

**Carrot.**—Early forcing carrot may still be sown. It is much better to use for many purposes while in the young state, and if it is sown now and kept properly cultivated and thinned out, it will in due season make nice young carrots for use in winter.

**Corn Smut.**—Carefully gather corn smut, and take it right away and destroy it by burning, as this will efface all germs of the fungus. It is a waste of time to pick it off and then throw in the chicken-yard or on to the rubbish heap, as the spores are kept dormant and only await a favorable opportunity to make their appearance the following summer.

**Spare Ground.**—Any ground in the vegetable garden that may not be needed for planting purposes, should be sown with crimson clover, or any other clover. The ground presents a better appearance if occupied by a growing crop, be it but a green one to be again plowed under before next planting time. Moreover, as is well known, clover adds much to the nitrogen of the soil, wherever it is grown and plowed in.

W. M. EDWARDS, Conn.

## The Bermuda Lily Disease.

As already announced in these columns, the disease of the Bermuda or Easter lily has been made the subject of study during the past three years by the Division of Vegetable Physiology and Pathology of the United States Department of Agriculture. The investigations, carried on by Mr. Albert F. Woods, assistant chief of the division, are not yet completed, but it is believed sufficient information has been obtained to warrant a preliminary report on what has been accomplished. This report will soon be issued by the Department of Agriculture, but in view of the fact that bulbs are now coming in and that planting will soon begin, a brief review of the main facts set forth may be of value.

The lily disease is characterized by the spotting and distortion of the leaves and sometimes the flowers and a general stunting of the plants. When the flowers are spotted the plants are unsalable, regardless of the condition of the leaves. Where the flowers, however, and the upper whorls of leaves are not injured the plants may still be sold for certain decorative purposes.

The disease occurs in Bermuda, where the bulbs are grown in the field; in this country, where they are forced, and in all probability wherever this and related lilies are cultivated. In this country it destroys from 20 to 60 per cent. of the crop of *Lilium Harrisii* planted, and as to the losses elsewhere there are no figures available.

The disease has been attributed to worn-out soil, premature removal of flowers and stems, premature harvesting, improper propagation, bad treatment during forcing and the attacks of various insects and fungi. All these matters have received more or less attention, and experiments, extending through several seasons, have been

in well-drained, well-aerated soil, containing not more than one-fourth well-rotted manure. All injured bulbs should be thrown out and in watering exercise care in keeping the young foliage as dry as possible, for it may be injured by having water injected into the tissues. In feeding avoid the use of solutions of horse, cow and sheep manures, as they have a tendency to clog the soil, resulting in asphyxiation of the roots and consequent injury to the top. Soluble chemical foods may be used to advantage, but caution must be exercised in applying them.

The matter in the report is treated under the following heads: (1) Characteristics of the lily disease, (2) prevalence of the disease and its destructiveness in this country, (3) theories as to the cause of the disease, (4) evidences as to the causes influencing the disease, and (5) preventive measures.

B. T. GALLOWAY.

## Chrysanthemums.

**Scald.**—Dull, cool weather, followed by a hot day, is usually the time when scalding takes place, the plants then being soft and easily wilted. The house should be kept very moist to keep the foliage stiff, and if this be done, scald can usually be prevented.

**Golden Wedding.**—Of all varieties this is perhaps one of the most susceptible to scald, and certainly one of the hardest to grow well. It does not need nearly so much water as the average; with the least overwatering the "yellows" appear and the foliage dies away at the bottom of the stem. But if one does happen to strike the proper conditions, Golden Wedding is a magnificent variety, though it is within the bounds of possibility that Modesto will crowd it out in time.

FIG. 133—SECTIONAL ELEVATION OF FIG. 134 ON LINE A B.

made to prove the truth or falsity of the various theories. As a result of the work the evidence is sufficient to warrant the statement that the trouble is not due to any one thing, but is brought on by a combination of factors, involving long-continued improper selection, propagation and cultivation in the field; the work of a mite (*Rhizoglyphus echinops*); injuries resulting from the punctures of plant lice, or aphides, and the attacks of certain bacteria and fungi, notably an *Oospora* related to the one associated with potato scab. The injuries from the mites, aphides and fungi are always more severe on plants which have been weakened by improper methods of propagation, selection, etc., while being forced.

In regard to preventive measures, it is plain that work must begin where the bulbs are grown in the field. Every plant that shows evidence of disease should be destroyed, and only the strongest and healthiest bulbs should be used for propagation. A second selection should be made when the plants from the scales are being transferred to the field. A third selection should be made when the bulbs are prepared for shipment, so as to reduce as much as possible the difficulties encountered by those who force the bulbs. In the field rotation of crops should be practised, for bulbs long grown on the same soil will have more of the mites and other parasitic organisms to contend against; hence will run greater risks of being weakened. The bulbs should be ripened with their stems on and should be dug only when fully matured and rested.

When forced, bulbs should be planted

Side Shoots should be removed as soon as they can be caught hold of. They all detract from the vigor of the main stem, and it is wonderful what a quantity of laterals a single plant will produce in a season. It makes a big difference to the flower if all the energy that would be spent in throwing out useless side shoots and suckers be concentrated in the proper channel. Plants should be picked over every morning. The work then does not take so long, and many a stray caterpillar and grasshopper will be found at the same time.

**Benches** should have the surface scratched over once a week. This will keep the soil sweet, and weeds will not become unsightly.

**Pots.**—If the soil comes away from the edge of the pot, it should be rammed around very firmly, for otherwise in watering the water will run down between the pot and the ball, which latter will get dry in the center, and the whole plant suffer in consequence C. TOTTY, N. J.

Strange as it may seem, the reports are favorable for a large peach crop from the Hudson valley district. Grapes are also reported to be in heavy bearing. Nine years out of ten the report has been that the frost has killed the buds, the bugs have destroyed the prospects or a heavy wind-storm has robbed the trees of the crop after it has become set.

The raspberry crop this year in the vicinity of Rochester, N. Y., is said to be the largest grown for years. Red raspberries have been greatly benefited by the heavy rains. The prospect of an immense crop of long blackberries is assured.

## Commercial Grape Growing Under Glass.\*

The excellent paper recently given by Mr. William Scott before the New York Gardeners' Society and since published in full in *American Gardening* very fully treated upon the cultivation of the grape under glass; so we now direct attention to the commercial aspect and possibilities of grape culture under glass.

In October, 1887, A. F. Barron, in the third edition of his "Vines and Vine Culture" (page 96), says:

"A great trade in English winter grapes seems likely to become established with America. During the past two seasons regular consignments of English grapes have been sent from this country (England). They have been found to travel well and to arrive in good condition and prove of superior

done with the native or hardy varieties, who knows but that one day the same may be said of this same locality for its hothouse grapes? One essential feature in such a business is close proximity to the market and special facilities to reach it; these are possessions of Poughkeepsie to a marked degree.

A very natural question will by this time be uppermost in your minds: Is there a market for any quantity and at figures sufficiently profitable? Yes, both are at your command, if the proper quality be produced, and in sufficient quantity. As to what quantities of hothouse grapes New York already uses, many will be surprised to hear that every week for twenty weeks, from the end of October to the end of March, an average of three-fourths of a ton of grapes comes into New York City from England and Belgium. This is mostly of the variety Gros Colmar, and the average price netted by the

he was not satisfied with the returns, so he solicited me to look into the matter for him, which I did, and with this result. The agent to whom he shipped was not able to dispose of these goods direct to retail merchants so he disposed of them to two wholesale commission men, and they in turn served other wholesale houses, from which the fruit reached the retail man or store-keeper. There were thus really four commissions, to which had to be added express, or ocean freight, duty and brokerage, making in all over 100 per cent. charges, which the consumer had to pay, together with the net return received by the grower; and apparently the customer was satisfied. This last season with a better knowledge of our market, my friend will probably clear 85 cents per pound.

This actual case is cited that it may be known we are not dealing with fancies or theories or something guessed

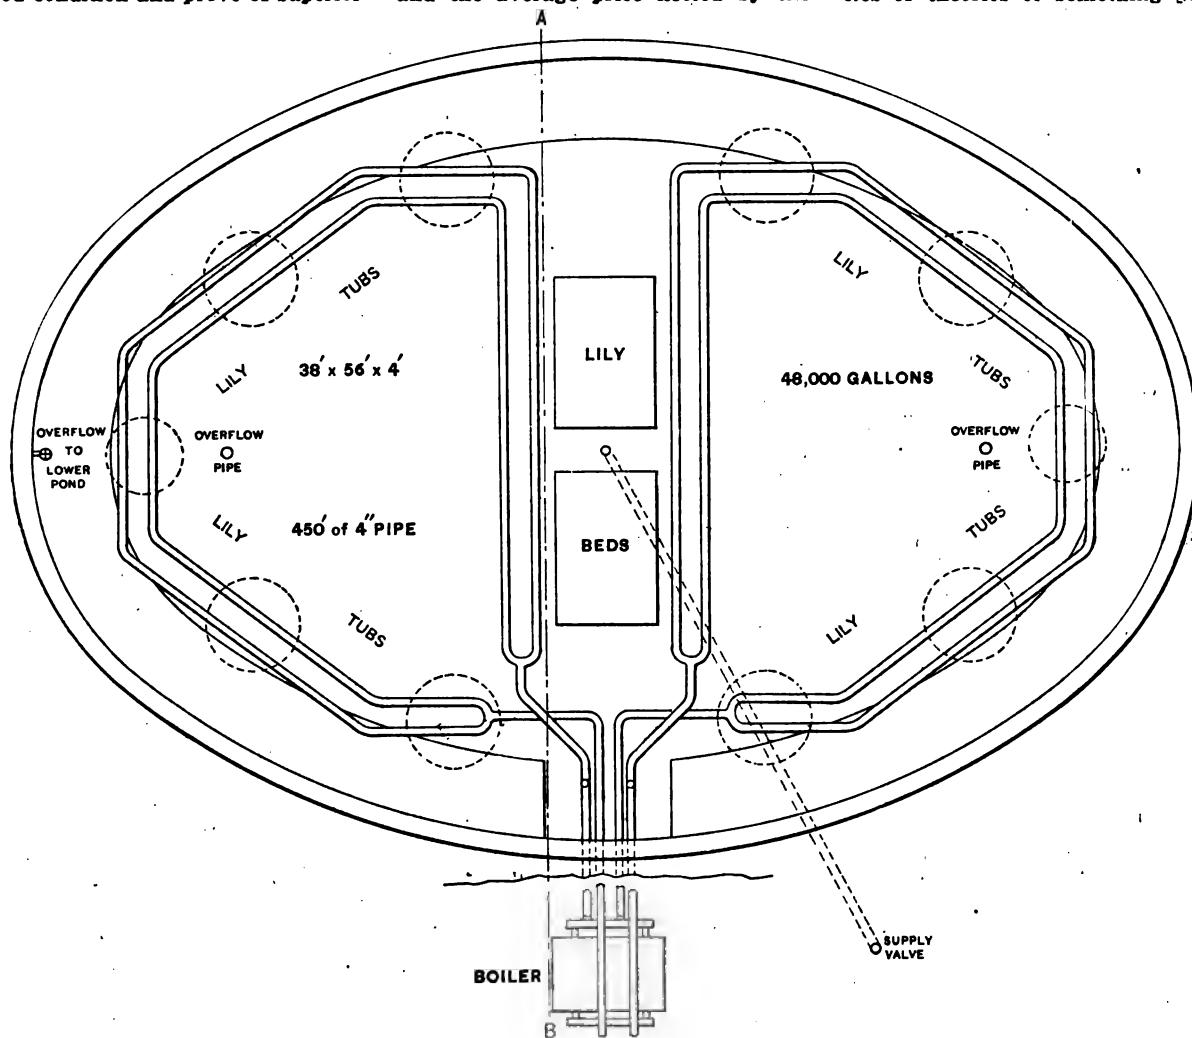

FIG. 154.—HEATING THE LILY POND IN PROSPECT PARK, BROOKLYN, N. Y.—PLAN. (See page 540.)

quality to American produce during the winter season. They are sent by the Cunard steamers, reaching New York about ten days after being cut; some are sold on arrival at New York, while others are sent on to Philadelphia, Boston, Pittsburg, Chicago, etc."

This paragraph is quoted in its entirety to prove that the subject is a live one and further to demonstrate that this branch of grape culture has been overlooked in this country. The subject is one that I have long had upon my mind, and I know of no better centre from which to start the ball rolling than Poughkeepsie.

The Hudson River Valley is famous for its native American grapes, and right here are produced some of the finest berries sent to our great metropolitan market. And if such is already

European grower this present season is 85 cents per pound, the selling price at wholesale ranging, according to market quotations as reported week by week in *American Gardening*, from 85 cents per pound for damaged or inferior berries, to \$1.25 to \$1.50 per pound for No. 1 quality, from some time before Easter, and until after that festival they are worth \$2 to \$2.50. Thus with the average price of \$1 per pound, every week an average of \$1,500 are sent abroad for what could well be produced here. As a matter of fact, the sum is really more than is quoted.

As an illustration of what profits there are in the article and the disadvantage under which the European shipper works, let us refer to an English grower of my acquaintance who, during the season of 1892-3, shipped 450 pounds per week for the entire season, which netted him 62 cents per pound. The grapes were of very fine quality, and

about; and, remember, that it is only one grower that is mentioned; there are to-day many growers shipping to this country and there are also more receivers than formerly. At present we know of five in New York City. Of what is done in other ports and cities we have no knowledge.

It is thus amply demonstrated that the industry is already of importance; that it will continue to grow admits of no shadow of a doubt, and while we are now discussing the need of taking this away from our brothers across the water and our legislators are considering the need of adding duty to protect us, we must thank our European friends for creating the market and making possible commercial grape growing under glass in this country as a profitable business, especially for winter grapes.

There is a striking analogy commercially between our condition to-day and

\*Substance of lecture before the Dutchess Co. Horticultural Society by J. Withers.

that which existed in Europe until the year 1886, as is shown by a reference to the book already referred to.

The next question of importance is: Will the Gros Colmar and other late grapes thrive here? Our answer is emphatically, Yes! In our journeyings we have seen here as fine Gros Colmar grapes as were ever produced in Europe. For instance, at the establishment of W. H. Macy, at Macy Park, during last summer, we saw vines of Gros Colmar bearing 18 to 24 bunches of large size, with large berries and of magnificent color. Mr. John Shore, the gardener there, told me he found he simply had to crop them heavily, the growth generally being so vigorous; also that he had, for several years, carried a crop as heavy as the one in sight. He figures upon keeping the table supplied each year until Christmas, keeping his fruit when cut in the top of the water tower.

In Rhode Island, in several parts of Massachusetts, and elsewhere we have also seen the variety thriving. Sometimes it is a little subject to a curling of the leaf in very hot weather, but this can be prevented by applying a little shade to the border.

In a later issue will be given specific directions for embarking in the business.

### Controlling Growth by Fertilizers

The possibility of suddenly altering the course of growth of plants by the use of fertilizers under present working conditions is a very dubious question. A general tendency of growth may be obtained by using different fertilizers, but no rapid and sudden changes can be made. On the other hand, it seems to me that under conditions vastly different from present practice, it may be possible to effect comparatively sudden changes by the use of different fertilizers. The first essential is a soil poor in plant-food, the poorer the better, yet in as good mechanical condition as the best greenhouse soil. Such soil may be prepared by mixing sand, crushed coke and coal ashes in proportions varying with the character of the materials employed. It will then furnish a medium to support the plants and through which plant-food may be transmitted to the roots. In this soil, practically free from plant-food, plants will make but little growth and finally die for want of nourishment. No better condition and no other so nearly approaching nature can be so easily secured for the study on a practical scale of the effect of different fertilizers on plant growth. Here, an application of nitrogen would soon produce a result due to it alone. Plants fed on a large amount of phosphoric acid and but small amounts of potash and nitrogen would quickly mature, there being no reserve store in the soil to interfere.

Good crops of tomatoes have been grown with the assistance of proper fertilizers in a soil such as I have described. I believe it feasible to grow flowers extensively under similar conditions. A careful experiment, conducted under the auspices of some florists' club, would let in a great deal of light and smooth away many of the present difficulties.

The science of fertilizers is well established, the art of using them in the greenhouse is not yet far enough advanced to be in its infancy. Fertilizers that work excellently on a farm will not do at all in the greenhouse. Enough work has been done to show that acid phosphates may and frequently do sour the soil, so that plants in the confined indoor space are ruined. Impurities, such as an excess of chlorine or sulphates, are known to cause very unfavorable effects in field work, they will certainly do more harm in a confined space, where they accumulate and remain in the soil.

There are no good grounds for argument against the statement that pure fertilizers are the only ones that can be used with certain profit by florists. Phosphate of potash, nitrate of potash and phosphate of ammonia are now used with marked success by at least one large firm of growers, and probably by several others. These materials come high, but the cost per pound of plant-food is but very little more

than in ordinary fertilizers. This extra cost is amply compensated for by the purity of the materials. They afford the ideal fertilizers with which to test and apply this suggestion of changing leaf development to flower production; all are soluble in water, and easily applied in solution. Different plants growing in a soil such as I have indicated, and fed with dilute solutions of these substances, would quickly show the effect of different elements of plant-food. The results will show the effect of nitrogen, of potash, or of phosphoric acid, uninfluenced by impurities which load up the soil, and by acid phosphates which make it sour. Under such conditions nitrogen may promote leaf-growth and retard flowering on a commercial scale, and phosphoric acid may push the flowers along when they are wanted.

In a matter so complicated as the growth of a plant, all conditions except the one studied should be eliminated if possible, so that any abnormal effect may be traced to its source. The effect of a single medicine cannot be determined when the patient is dosed up with a lot of others.

Isolated cases will doubtless be found to seemingly refute many of the statements that I have made. At the risk of being over-bold in statement, I have endeavored to make clear the difficulties in the way, and the possible means of attaining that millennium of the grower—when he can absolutely control his crop, stop it when the market is flat, and push it on when the opposite is the case. JOHN FIELDS.

FIG. 155.—HEDGE OF DWARF PEARS.

### A Hedge of Dwarf Pears.

There are numerous shrubs that are suitable for making hedges about one's lawn, whether one prefers evergreens or deciduous shrubs, but the number is limited that can be used in hedgerows that are of both use and beauty. The barberry is one of the latter, these bushes making a very graceful, but not densely leaved, growth; but the barberry's fruit is not desired in large quantities, nor is it a desirable plant to have near wheat fields, as it harbors one stage of the "rust" fungus of the wheat.

On my place I am planting hedgerows of dwarf pear trees, using winter varieties of the fruit almost exclusively. Such a hedgerow is, of course, hardly suitable for the front of one's lawn, but for side rows, and for use in the rear of one's house, the dwarf pear is quite unobjectionable. As for beauty—well, any one who has seen a long row of these little trees in full blossom will not soon forget the sight. They are very attractive little trees, also, when in full leaf, without the bloom, as they should be kept well trimmed back to secure good fruiting, as well as a good hedge. It is surprising, too, what an amount of choice fruit one can thus raise upon even a small place. In my own case, I am running a pear hedge around a two-acre lot, and am using also some cross hedges in the rear of the buildings. It will take at least 300 trees to complete the outside row. As this will interfere very little with the planting of fruit trees over the whole interior surface of the two acres, it will be seen that on a given

amount of ground one can raise much more fruit by using this outside hedgerow method. It is possible to crowd the little trees in a hedgerow, because they will be on the outside, and can thus have plenty of air and sunshine, though very close in the row; and though the row of dwarf pear trees may be quite close to the inside, larger fruit trees, the latter are not crowded by the former, since they stand up above them. This sort of work is not advisable on large commercial orchards, but on the home acre, in the village lot, one wishes to make the most of every foot of ground.

Planting so many of these little pear trees, I selected winter sorts, and chose that king among pears, the Anjou, and the scarcely less inferior Lawrence. Both these pears do finely on the quince stock, and both are winter varieties. With such fruit one can store in a cool cellar and unload upon the market when the market is most in need of winter pears. With fall fruit, one is very nearly at the mercy of the market, for he cannot hold the fruit for any length of time.

My own trees are set about 4 feet apart. In future plantings I shall increase the distance somewhat. In setting the trees be careful to get the point where the pear stock and quince root join several inches below the surface, and for the first winter, at least, give the roots a mulch for protection.

W. D.

### Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

DAVID B. WOODBURY, South Paris, New-Trade List of Pansy Seeds.

KEENE & FOULK, Flushing, N. Y.—Fruit and Ornamental Trees, Roses, etc.

HERB & WULLE, Naples, Italy.—General Catalogue of Bulbs and Plants.

SIEBRECHT & SON, Rose Hill Nurseries, New Rochelle, N. Y.—Pot grown Strawberry Plants.

HENRY A. DREER, Philadelphia.—Quarterly Wholesale Price List of Bulbs, Seeds, Plants, etc.

HENRI BEAULIEU, Woodhaven, L. I.—Price List of Seeds, Bulbs, Plants and Garden Supplies.

SIEBRECHT & SON, New Rochelle, N. Y.—Price List of Pot Grown and Layer Strawberry Plants.

M. J. LYNCH, 256 Main St., Poughkeepsie, N. Y.—Tested Seeds, Trees, Shrubs, Plants, Bulbs, etc.

THE LOVETT COMPANY, Little Silver, N. J.—Price List of Pot Grown and Layer Strawberry Plants, etc.

CH. MOLIN, Lyon, France (H. Beaulieu, Woodhaven, N. Y., agent).—Catalogue of Seeds, Plants, Trees, etc.

J. M. THORBURN & CO., New York.—Trade Price List of Turnip and other seeds adapted to the present season.

LETELLIER & FILS, Caen, Calvados, France.—Price List of New Hybrid Cineraria, Boule-de-Neige, with pure white flowers.

LOUIS VIEWEG, Seedsman and Nurseryman, Quedlinburg, Germany.—Seeds and Plants, American Raspberries and Blackberries.

NEIL, THE NURSERYMAN, Laporte, Ind.—Circular of the Gault Perpetual Raspberry. Also general list of Nursery Stock and Fruit.

FREDERICH SPITTEL, Armstadt Thuringia, Germany.—Colored plate of selected large flowered fancy Pansies under name. Some excellent varieties are included.

ELECTRIC WHEEL CO., Quincy, Ills.—Catalogue of the All Iron Wheels Runners, etc., for all purposes made by this firm. Wheels can be had for any wagon.

F. SANDER & CO., St. Albans, Eng., and Bruges, Belgium.—Descriptive List of Novelties for 1897; profusely illustrated. Those in search of desirable novelties should procure a copy of this list.

LETELLIER & SONS, Caen, France.—New Cineraria Boule-de-Neige (Snow Ball.) This is a semi-dwarf with white flowers and disks of creamy white, thus quite distinct from all other Cinerarias.

## Gloxinias.

There are few tropical flowering plants more showy or more satisfactory than the Gloxinia. Its handsome tubular flowers ranging in color from pure white to deep purple, and from the faintest pink to deep rose, the length of time that plants are in flower (usually from three to four months) together with their bright green foliage, commend them at once to the favor of almost everyone.

The accompanying illustration (fig. 156) represents a batch of plants grown at Smith College Botanic Garden, from seed last season, and although most of them produced a few flowers last fall, they are now practically flowering for the first time.

Seed was sown the first week in March of last year in well-drained pans, the compost consisting of one-third leaf soil, one-third peat, and one-third silver sand, the whole sifted finely. The pans were placed in a temperature of 70 degrees and kept shaded. As soon as the seedlings were large enough to handle, they were pricked off into other pans. Until the

certificate of merit, and it is called Gloxinera, being considered the forerunner of a new race.

The Gloxinia is a native of Central America and perhaps it may be interesting to many of the readers of American Gardening to know that the name Gloxinia is not the correct one. The proper name according to the rule of priority in plant names adopted by botanists, is *Sinningia speciosa*, but the name Gloxinia is so well established that it will take years to disestablish it.

EDWARD J. CANNING, Northampton, Mass.

## Grafting Cereus.

Would a *Cereus grandiflorus* do as well grafted on a five-year-old plant of *Cereus Macdonaldi*, as it would grown on its own roots, and would it bloom sooner than to grow it from a rooted cutting? In case of grafting would it be best to cut all the stems back and graft on all or only cut one or two? It has three main stems.—C. M., Pa.

—We see no reason why it would not

leaves. The stock solution (see page 276) should only be diluted with from eight to ten parts of water for use on this pest. In small fields the old bugs can be destroyed by trapping. This is done by placing bits of boards around the plants for the adult bugs to hide beneath. These are visited two or three times a day. The bugs are killed by crushing, or by throwing them into a dish of kerosene. The adult bugs should be trapped during June and the first half of July.—F. A. S.

## Begonia Disease.

For two years I have failed with my tuberous Begonias. Soil; leaf mold, garden soil and sand. Location; some in greenhouse, some in dwelling house, some in garden; all shaded most of the day from sun. The tubers were started by planting in small pots, unsprouted tubers, about March 1. In every case the plants sent up a few fine flowers, then quit blooming, and in many cases the buds dropped, and the leaves blackened more or less.—E. A. DODGE, Mo.

—The plants are suffering from a disease which is peculiar to the tuberous Begonias, and by many thought to be bacterial, but little is known about it. Experts sometimes treat it successfully, but their method is only possible where whole houses are devoted to the one plant. The main point is a change of atmospheric conditions for a time, so that the bacteria cannot thrive. Badly affected leaves and also all flower buds are cut away, and the plants are syringed several times during the day, and in the afternoon the house is thoroughly damped down and the ventilators closed. The effect of this is to produce a more rapid and new growth. Then when this works satisfactorily and new flower buds appear, the temperature is again brought back to the normal.

The treatment of our correspondent's plants seems to have been wrong, inasmuch as they have been kept too heavily shaded, and possibly a fetid atmosphere was the result. Tuberous Begonias resent such conditions perhaps more quickly than any other plant cultivated. The proper conditions and temperature for them are those of a light, airy, well-ventilated greenhouse with only natural sun heat, unless during very cold weather, when a little heat may be applied, if possible, and the ventilators opened, but in ventilating, care must be taken that cold currents of air never strike directly upon the plants; judgment is needed in watering, the ball of earth in the pot needs to be kept moderately moist, never remaining wet, nor yet ever becoming quite dry, while the plant is in a growing and flowering condition.

## Soil for Strawberry Runners.

Is it necessary to use prepared soil or only that which strawberry plants grow in, when potting them?—Geo. B. W., L. I.

—If when laying the runners in pots the first time is meant by the question, only ordinary soil is needed. For other purposes see notes on strawberries in various issues of American Gardening.

## Tomatoes Not Setting.

(To Mrs. T. C.)—Without knowing more of local circumstances, in fact, without seeing the whole conditions personally, no positive reply can be given. The flowers fall because they are not fertilized. Cold and damp may be accountable.

## Why Do I Fail?

(To Subscriber)—It is absolutely impossible for us to give you any assistance unless you furnish full particulars. To merely ask "Why do I not have success with Peonies, Clematis, English Violet, etc.," is waste of time. What think you of our saying, "Why did our grandmother die?"

From northern Ohio the latest advices are: Apples still falling and will be comparatively small crop. Cherries and raspberries very good. Blackberries good. Grapes scarce. The locust has disappeared.

FIG. 156.—HOUSE OF GLOXINIAS.

plants were potted, all the water they received was given by the subirrigation method, that is, the pans were placed in pot saucers of water until they were sufficiently moist. It is fatal to Gloxinia seedlings to water overhead, and in fact, at no time must the plants be watered this way. As soon as large enough the seedlings were potted and grown on rapidly in a well-shaded house and kept rather close. Toward the middle of September the leaves began to show signs of maturity, water was then gradually withheld until the leaves had all died away naturally. It is most important that the leaves ripen well and should not be removed until there is no more life left in them, as they return to the tuber the starch and other substances they contain while in growth. As soon as the leaves are all off, the pots may be stored away on a shelf in a temperature of about 60 degrees or the tubers may be taken out of the pots and placed in sand in shallow boxes and stored in a warm cellar until toward the end of February, when they should be repotted and gradually started into active growth again.

The Gloxinia belongs to the family Gesneraceae, to which belong the Achimenes, Gesneras, Isiolomas, Streptocarpus, etc. New varieties may be obtained very readily by cross-fertilization. Among the novelties offered this year by Messrs. James Veitch & Sons, the well-known London (England) nurserymen, is a hybrid between a Gloxinia and a Gesnera. It is spoken of as quite an acquisition, the Royal Botanic Society has awarded it a

do well, and grafted, it would certainly bloom sooner than from a cutting. Do not graft more than two stems this year, then graft the other next year if the two take this year. The work should be done at once, as June, July, and August are the growing months. We suppose the true *Cereus*, round stems, is meant. If the flat-leaved or stemmed *Phyllocactus latifrons*, the graft would not unite.

## Bugs on Squash Vines.

(To W. B. L.)—The insect sent by W. B. L. is the common squash-bug (*Anasa tristis*). Although the young of this insect pumps the juices from the leaves so rapidly that the latter soon look as if a fire had struck them, I have never known the bugs to attack the vines where the latter leaves the ground. Besides the adult insects feed very little, if any, during July, or the period during which they are busy laying their eggs. Hence, I mistrust that if W. B. L.'s vines are injured at the point where they leave the ground, it is the work of the squash-borer, or possibly of one of the "stem-rots" of the vine. The young squash-bugs can be reduced in numbers by thorough and persistent spraying with kerosene emulsion. It will be necessary to have some form of spraying machine for this work, as the emulsion must be applied to the under side of the leaves. The spraying should have been done every other day from July 20 to July 30, and so thoroughly that the emulsion will drip from the

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1896.

PUBLISHED BY

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Mailing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

OUR remarks in last issue upon the subject of Nitrogen crops furnish a basis for some amount of thought, and thought is the most potent fertilizer that can be applied to the soil; it brings the largest crops. The first eye-opener is the importance of some "catch crop" for the improvement of the land; this is important, yet comparatively few realize it; how few understand to what extent the soil is willing and anxious to be at work. But nature abhors idleness as she does a vacuum; she will be at work producing something, and if we do not give her seed to plant, she will plant her own, and let us mourn the result—a glorious crop of weeds.

Whatever may be the arguments in favor of fallowing, the practice is not one that is open to the ordinary farmer in the neighborhood of great areas of population. He must follow the teaching of "intensive cultivation" or the getting from the land as much as possible as often as possible.

The soil needs no rest; on the contrary, it demands work, but it does desire a change of work, and that is why the rotation of crops is an agricultural necessity. This is shown plainly by nature's own plantings, where one crop follows another in rapid succession; one form feeds upon the waste of another, or, in other words, one plant puts into the soil the elements that another takes out, and Mother Earth gains a little in absolute fertility by each operation, if the sequence has been proper.

Reducing the theory as just stated to practical ends, we can say that crimson clover should be employed to make up for what the corn, wheat, or potatoes has taken out. We say crimson clover, because it is better adapted to the purpose than any other; its open hands are held out to grasp the nitrogen that abounds in the air, and it gives as freely as it receives. This plant is so well adapted to this purpose of soil enriching, from the fact of its being, in its native heath a winter-growing plant, and, in this climate, it is idle but a small part of the time, as our ground is rarely frozen up before the New Year, and between that time and early spring there are frequent periods where this clover will make considerable growth.

But there is an important consideration that is frequently wholly overlooked; that is, the proper selection of seed suited to the locality in which the desired crop is to grow. All plants adapt themselves to their environments; where they have nine months to grow and reproduce themselves, they will use it all. But take the same plant to a locality where it has but four months to grow, it will, as a general rule, soon adapt itself to the situation and ripen its seed in the time given. And it will make just as much growth in the four months as in the nine. For that reason it is advisable to obtain seed grown in conditions somewhat approaching those of the locality to be sowed.

Almost the whole of the seed offered is grown in Europe, where its growing season is longer than with us, and consequently, the plant does not make so large a growth here as there. But, if we were to save our own seed, in two or three generations it would make as large a growth here as there. It would, moreover, be less liable to winter kill, not because its nature would be changed, but because the extra growth it would make would give it more strength. On Long Island crimson clover seeds very freely, at least it did last season. Had that seed been saved it would undoubtedly have produced a much better crop for that locality than foreign seed.

This is a matter of great interest to our cultivators, and they should make a practical test with seeds of their own production. We hope to say more about "catch crops" on a future occasion.

IF the stand of Park Commissioner Rogers, as set forth in another column, be a true deduction from the facts, and it be allowed that "experience proves that lawns cannot be maintained, if all who wish may walk upon them at will," it is a sad commentary upon the intelligence of the American citizen. The argument, however, is not borne

out by the facts. For instance, in Prospect Park, Brooklyn, N. Y.; in Chicago, Ill., and elsewhere at home, also in many European cities, experience proves that lawns can be maintained, and an unlimited number of people be permitted to walk upon them at all times without serious injury.

## Keeping Cabbage Through the Winter.

The old plan of burying, or putting cabbage in trenches during winter, or for winter use, has become obsolete, and a more simple and easy plan has been adopted. Where cabbage is grown on a large scale for shipping purposes, the best plan is to lift the cabbage and stack them two tiers deep and as closely as they can be placed in an orchard, or wood if convenient, and cover with leaves to the depth of two or three inches, the leaves to be kept in place by a slight covering of earth. In this way the heads will keep perfectly sound all winter, and they can be easily taken up as wanted for shipping.

For family use cabbages can be kept in the same way, only it will not be necessary to make the second layer. It is quite important to keep them a little below the freezing point. It has been suggested to keep them in some convenient building, but this plan has always resulted in failure, as the dry atmosphere is fatal; cabbage must be kept moist and cool, the slightest wilting renders it unfit for the table.

## Conditions in Michigan.

A correspondent in Berrien Co., Mich., writes: "There is not a man here who has made a dollar with fruit this year; nearly all have quit picking blackberries as they did strawberries, raspberries and gooseberries. The bushes are full, but the returns do not pay expenses. Apples have nearly all fallen off the trees, peaches but few, pears good crop, grapes heavy crop, none killed by early or late spring frosts."

—What are the faulty means of distribution that bring about the conditions of which the writer of the foregoing tells us? Something is wrong, 'tis evident. In the larger cities there are hundreds of people to whom fresh fruit would be welcome if they could get it at a cheap figure, but no matter what the circumstances at the producer's and the consumer generally has to pay the average price, never reaping the benefit of supply.

## Fruits Received.

**Gooseberries.**—We lately received a number of samples of gooseberries from the Cairnwood orchards, Huntingdon Valley, Pa. Mr. Peder Pedersen, the manager, says that on that place they have planted over 1,300 fruit bushes, and it is intended to go largely into gooseberries of the large fruited sorts. The bushes are grown on the English plan and are doing well indeed, as the grand samples of fruit testify. Industry, Triumph, and White-smith were specially fine samples, and the profusion with which the large berries hung on the branches was a revelation. Mr. Pedersen thinks that in a great measure his success is due to selection of stock for propagation. At all events, the fruits are as large as any one could reasonably demand and fully four times the size of the general run of those offered on the markets.

**Japanese Plums.**—Samples of two distinct Japan plums were lately submitted by Mr. Williams of Montclair, N. J. The moderate size of Ogon renders it a handy dessert fruit, and its clear golden color is very attractive. In flavor the variety is not so aromatic as many other of the Japan plums. Simon is specially fine, the brick red color is attractive, and the flavor peculiarly striking, recalling some of the aromatic pears. The flesh is firm and the fruit large.

## Cordon Currants.

The red Currant at all times proves very amenable to training and can be got to fruit in a great number of forms. One excellent method is the horizontal cordon on the side of garden paths. Our illustration on page 549 shows a well-fruited branch from such a specimen grown on a trellis in the nursery of Ferdinand Boulon, Sea Cliff, L. I.

Another method of training, and one to which we wish to call attention at this time, not only produces excellent fruit in abundance, but also prolongs the season very considerably; that of vertical cordons on north walls. It is rare that such a position cannot be found around a country house, either on the barns or other outhouses, or even if need be, on some part of the dwelling itself, for the bushes are sufficiently ornamental to permit their use for that purpose when properly attended to.

To so train and cultivate the currant is a very simple matter, requiring but little time and no expense. The young trees may be planted about 15 to 18 inches apart and trained to one stem, or they may be induced in a young stage to make three leads which can be run up vertically at intervals of about 10 inches between the stems.

By strict attention to pruning so as to keep the spurs short, extra large racemes with heavy berries are possible, and are of special value for exhibition and other show purposes. In addition also, the lateness of the season to which the fruit may be kept is another advantage which the system possesses. Fruit thus grown can be easily protected from the depredations of birds and other pests, it being an easy matter to cover the bushes with nets or cheesecloth.

## Lawns in Parks.

To the Editor of American Gardening.

All ought to agree that a public park should be designed, improved and maintained so as to better the health and add to the happiness of visitors. A quiet, restful, pleasant, beautiful place with pure air and water, ought to be the first requisite. The improvements should have for central thoughts, necessity, and simplicity. Drives, rambles, ample open wooded spaces, shelter, seats and resting places free of access to every one, with all the turf that can be induced to grow upon grounds so used, are all reasonable necessities. But lawns, shrubbery, and tree plantations for garden effects are just as necessary for the enjoyment of many, as any of the above.

Your correspondent, Pro Bono Publico, (page 525) says: "To exclude children from lawns or the cool secluded nooks of a park is as bad on the one hand, as is the desecration of a bit of fine landscape, by incongruous buildings, on the other. The parks are paid for by the people, and they should have the use of them."

It is certainly very pleasant to stroll across beautiful lawns, and innocent children playing upon them would be an attractive picture. A limited number might be permitted to walk upon lawns at times without serious injury, but in public affairs there can be no privileged class, and all must be allowed upon the lawns or all excluded. Experience proves that lawns cannot be maintained, if all who wish may walk upon them at will; and this is the vital point always omitted by those who urge that lawns should be opened to the public without restriction. The truth is, if their advice were followed there would simply be no lawn. And this is the exact situation. Either lawns must be prohibited in parks or the public must be prohibited from using them for by-ways and foot paths which is always done when thrown open.

To say that the public cannot use a lawn unless permitted to walk upon it, is merely begging the question. As well might one say that pictures upon a wall are not used because not walked upon as carpets. Lawns with groups of shrubs and trees are only pictures upon the park walls, so to speak.

In one of our parks at Youngstown, containing over 400 acres, is a natural

garden of perhaps twenty acres, so arranged by nature that walking upon its surface is practically impossible. Yet no other portion of the park is more useful. To look upon the rocks, moss, ferns, shrubbery, trees, and cascades preserved by nature from vandalism, is the height of enjoyment to all, and the most highly prized portion of the park area.

That garden art is only appreciated and desired by the rich is a very mistaken idea. Fortunately, one does not need wealth to appreciate a beautiful garden; and the rich have no monopoly upon cultivated taste and refinement.

I dislike class distinctions, however, and there really are none. The rich of today may be the poor of to-morrow and vice versa. In America we are equals before the law with substantially equal opportunities before us, and if there is any place where all thought of class distinctions should be banished, it is in the arrangement and use of our public parks.

No park should be either all lawns or all play grounds. A complete answer to Pro Bono Publico is, that all parks should be large enough not only for what he desires, that is possible, but for lawns and other necessary requirements.

VOLNEY ROGERS, Youngstown, Ohio.

## Hollyhocks.

The old-fashioned Hollyhock in its modern, much improved state is among the most beautiful of flowers for the background of the flower garden.

Seed sown in February or March in a frame with gentle bottom heat will generally bloom during the coming summer. A good loamy soil is best, covering the seed to a depth of about one-half inch. As soon as the plants have attained the first rough leaves they should be transplanted into another frame without heat but protected from frost. As soon as the weather will permit, which in this latitude is generally from the first to the middle of May, the young plants should be set in the open ground where they are to remain permanently. If there are indications of late spring frosts, after planting out, they should be covered during the night, the covering being removed the next morning. By following these directions success is sure to come, and you will be well repaid for your trouble the following August and September by fine spikes of lovely flowers.

Those who do not possess a frame or hotbed may plant the seed in a box and keep it in a warm light place, but when possible the hotbed is undoubtedly the best, as it may be used for all kind of seeds—Stocks, Asters, Pansies, and a host of others.

If preferred, the seeds may be sown in July or August in the open ground and they will bloom the following year in August and early in September. Hollyhocks delight in rich, dry, loamy soil; the ground should be dug deep and well enriched with barnyard manure.

The plants should be set 3x3 feet, at least, and 3x4 feet is better, especially if you wish to have large handsome flowers.

Before severe freezing weather comes the plants should have some protection by laying on the crown a branch or two, sufficient to keep the litter or leaves from pressing too heavily on the plants and causing them to decay at the crown.

During the month of March following half the covering should be removed, shaking up lightly the remaining half. Don't allow the covering to remain on too long, as it will cause the plants to grow weak. During May and June give plenty of water, as the stalks and foliage absorb a great deal of moisture at that time.—W. B. LONGSTRETH, Gratiot, Ohio.

—The Hollyhock is a biennial and for best results should be treated as such. We should not like to see our plants flower the same year as raised from seeds.—Ed.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Clematis Dying.**—I have noticed inquiries in American Gardening for cause of Clematis dying, but as yet no reply. I have had trouble with Duchess of Teck dying, partially, all at once, for a number of years, and this year *C. paniculata* is affected the same way. The portion of the vine affected, acts as if completely cut off at the ground; that is, it dies all at once to the ground, with no visible reason why it should. Is there any known cause or remedy? Other varieties of Clematis so far have been uninjured with me.—VOLNEY ROGERS.

**Ants and Aphids.**—C. A. L. inquires what relation the "ant" bears to the green fly. Your answer is good, but tell him to get a copy of the "Strand Magazine" for August at any news stand and read the article therein by Grant Allen.—F. E. SNYDER.

**Watering During Sunshine and Other Things.**—Friend Butterbach evidently does not understand the point, regarding safety in watering during sunshine. I never but once had potatoes injured, yet that once was enough to put me on guard. It has never occurred in the greenhouse, simply because I never gave it the chance. I would ask what the "variations of temperature" are in the Northern states, and if just as healthy men, beasts, and vegetables do not thrive there as well as, or even better, than in a section more resembling the greenhouse conditions, i. e., Florida? Does not the "variation" of temperature render them more hardy, or can it be better secured, than by having plenty of cool breezes, or ventilation? Not knowing the prime object sought for, or the methods employed in the strawberry experiment, Mr. Butterbach is hardly competent to pass an opinion; however, it has brought out a fact not generally known among strawberry-growers. If callas can be had at any time of the year, why not add them to the list of cut flowers from outside, especially if it can be done without injury to the root? Why use months for resting when weeks will do as well? They would command a good price when out of the usual season. Saving fuel is no object with me, as it costs only the cutting, and even that is returned in the value of ashes, as I use wood-burning furnaces. The first three paragraphs of the editorial, page 538, seems to fit this case completely. Au revoir!—HENRY SNYDER, Md.

**Strawberries.**—When two such able veterans as Mr. Hale and Mr. Dwyer are upholding distinctly opposite views on the planting of strawberries from points where the climatic influences are somewhat similar, side issues are of small account. However, Mr. Kellogg will confer a favor to readers of American Gardening if he will kindly name the strawberry containing all the good qualities mentioned in his note of July 19, viz., plants laden with immense berries of rich flavor, sound to the core, and of a texture so firm (at the same time) that they can be shipped anywhere. Then I have gone astray in thinking that new plants had to be obtained from old bed or from seed. Where have those dormant plants in spring come from, when plants are not taken from old bed, and the young unfruited plants are not allowed to produce them?—JAMES HOLLOWAY.

Miss Bertha Stoneman, a student of botany at Cornell University, has been appointed professor of botany in the Huguenot college in Cape Colony, South Africa.

## The Fruit Garden.

**Apples, Early.**—If you market, make only one grade, and let that be the best. Feed the others to the hogs; it pays better than selling a No. 1 reputation.

**Gathering Pears.**—A man always wants to leave on the trees more fruits than are well for the tree's health; indeed, it is a good practice to pick some of the largest Bartlett early in August; you get a little longer season and help the tree; the remaining fruits will well afterwards. Many people like to feel they have something to bite, even in a Bartlett. Too often the fruit looks very handsome, and is mushy, because some of us wait to see them get larger or take on that yellow tint. Don't wait, but pick when quite green, at least ten days before they are likely to be used. Again, don't drop them around because they look hard.

Another pear that needs some thought about gathering in order to have it good is Clapp's Favorite, a pear too often soundly abused by amateurs, because "it rots at the core." And so it will—unless picked at least two weeks before it would ripen on the tree.

A close rival to the Bartlett is Souvenir du Congrès. Tree not so vigorous nor so compact a grower as Bartlett.

**Raspberries.**—Cut out the old bearing wood and give the rows a thorough spraying with Bordeaux.

JAMES HOLLOWAY, N. Y.

## Horticulture in 1836 and 1896.

Within the last century there have been more inventions and greater advances made in the arts and sciences than in any former period of the same length of time in the history of this globe. Horticulture has kept pace with these and is to-day more advanced than ever before. Sixty years ago the word horticulture was hardly mentioned. Now it stands next to grain raising in importance—not only in the pleasure and comfort that it gives to the human family, but also in a commercial point of view.

To go back three-score years seems a long look to the rear; yet that is what some of us can do, and remember well the condition of our fruits, and compare them with those of the present day. Then about all the strawberries we saw were found in meadows and fence corners, small but high-flavored. Now we have more than 100 varieties—large, luscious ones in abundance.

One might be safe in stating that there is now a car load of strawberries grown to every quart grown then. I remember when they were first taken to market in buckets and baskets, and were measured out in tin quart measures. Now they are put up in neat quart boxes, shipped in crates of twenty-four and thirty-two quarts each, all over the country. Not long since a friend in southwestern Missouri wrote to me that he sent a crate of Captain Jack strawberries one time to Albuquerque, New Mexico, that had to go sixty miles by stage to reach its destination, yet they arrived in eating condition, and, by the way, I may tell that same variety originated here not twenty yards from where I write this. It is still a favorite with some growers. Another valuable one was raised by a brother of mine, the Cumberland, which has but few superiors if properly grown.

Quite recently another brother has raised a black-cap raspberry that surpasses anything of the kind yet produced in this country. He has recently sold the stock for \$1,000. I have been a little personal in this, to show that the spirit of horticulture was born in the family, hence no wonder that it is still my hobby.

Then the black-cap raspberries were chiefly gathered in old clearings, strung on a stem of timothy and carried home in that way. Now the improved varieties are planted by the 100 acres. The only red ones then were what we called Purple Cane and the Red Antwerp.

Now the varieties can be named by scores.

Blackberries were all wild and the planting of them in gardens was not thought of. Now hundreds of plantations, large and small, can be seen all over the country. Currants were then the white and red Dutch (and they are still grown). Now we can count the varieties by the dozens.

Cherries, the Mayduke, Oxheart and Bleeding Heart were the improved varieties. The English Morello was a way-side tree. The Black Morello was common, but nearly abandoned on account of the black knot. Of the Mazzard, a black and red, there were trees sixty feet high, and three feet in diameter at the base, and trees that would bear a two-horse wagon load in a season. These were small, however, and by no means choice. Now we have a hundred varieties of select fruit of these.

Peaches.—Early York was then the earliest we had of budded trees, but plenty of good seedlings. The Early York ripened in August and was the earliest. Now we have a host of varieties, ripening from June until November.

Grapes.—The Alexander was the pioneer; then Isabella and Catawba, soon followed by the famous Concord, from which has descended a host of valuable varieties, both white and black. The Martha was the first seedling from it that became famous. It was sold to Mr. Knox, of Pittsburg, Pa., for \$500. He made a nice thing out of it, not less than \$10,000. Since then other white ones from it and from the Concord have crowded it out in a measure. Apricots we had growing on the terraces, but they seldom bore fruit. Prunes and plums we had a few, but the main crop of plums was from the native wild trees. Now, orchards of ten acres of wild goose alone are planted.

Pears.—We then had mostly seedling, and of very ordinary quality. Now we have double the number of varieties, which can be in eating nearly the whole year. Apples were then grown mostly for home use, and there were but few varieties compared with the legion we now have.

But to refute the idea that fruits run out, I will state that the Rambo, Red Romanite, Prince's Harvest, Winesap, Newton Pippin and Yellow Bellefleur that have been grown for 100 years still hold their place in every good collection. But what a multitude of new and valuable ones have been produced since then, and still they come.

Then each farmer raised principally for his own use and to sell in the towns near him. Now tens of thousands of acres are planted, and it gives railroads considerable work hauling them to their destinations, and mighty steamers to transport the fruit to foreign countries (3,000,000 barrels in 1895).

Then California was a Mexican State, and its future greatness as a fruit country was not dreamed of. Now she sends train loads of it across the Rocky Mountains to the East, and her grapes and wine to foreign lands. It is to-day the greatest fruit country on the globe.

Next comes Missouri, my adopted State, of which I am proud, and why not when she was admitted into the Union the same year that I was first allowed to breathe the air of this great Republic? May the good work or horticultural progress go on, and the time come when every man, woman and child will have all the choice fruit they need; a condition that at this time does not exist, for not one man in ten who owns land enjoys what he might if he possessed the true spirit and love of horticulture.

And here I will state that I do not see why agriculture and horticulture should not be taught in our common schools. In one hour I can show 100 boys how to bud or graft, so that they can change any worthless fruit tree into a good variety. And what a pleasure it is to the ladies to bud a new choice rose into a strong rose stock, and have lovely roses in two months after. If twenty years younger I would be tempted to go over the country as a

sort of horticultural evangelist and teach the people these arts that would add so much to the pleasure of life. S. MILLER, in Rural World, St. Louis, Mo.

## How's This!

We offer One Hundred Dollars Reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

F. J. CHENEY & CO., Props., Toledo, O.

We the undersigned, have known F. J. Cheney for the last 15 years, and believe him perfectly honorable in all business transactions and financially able to carry out any obligation made by their firm.

WEST & TRUAX, Wholesale Druggists, Toledo, O.

WALDING, KINNAN & MARVIN, Wholesale Druggists, Toledo, O.

Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system. Price 75c. per bottle. Sold by all Druggists. Testimonials free.

## Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 100 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1897, New York City

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advert., and each initial, or a number, counts as one word. No cuts or display type allowed.

HULSEBOSCH BROS., bulbs and plants, Englewood, N. J.

LOWEST PRICES on earth. Trees and Plants. Neil the Nurseryman, La Porte, Ind.

TRANSPLANTED CELERY PLANTS, all the leading kinds. John A. Smethers & Son, P. O. Box 104, Berwick, Pa.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York

EGYPTIAN ONION sets, for immediate delivery if wanted, \$1.00 per bus. F. O. B. Streator, La Salle Co., Ill. Address R. D. Kline.

DO YOU WANT the best flower pots? If so, send address to The Whilldin Pottery Co., 713 Wharton St., Philadelphia. Three shipping points, can save you freight.

CELERY PLANTS. Transplanted only. First-class, leading kinds. Greatly superior to seed-bed plants. Carefully packed: good for two weeks transit. 40c. per 100, \$3.00 per 1000. R. M. Welles, Towanda, Pa.

MANDOLIN AND GUITAR strings at bargain prices. Best quality Silver Steel Wire, 25c. per set, postpaid; 5 sets, \$1.00. Banjo strings, set 15c. Satisfaction guaranteed. Edgar P. Walts, General Delivery, Akron, Ohio.

## Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

WANTED, steady position on gentleman's place; by an industrious, honest and sober German, married, one child; thoroughly understands the care of horses, carriages, garden, cows, etc., best of references. A. Sorgenfrei, Box 300, Tarrytown N. Y.

SITUATION wanted.—Gardener, experienced greenhouse hand, well up in agriculture and landscape gardening, wishes head position on gentleman's estate, under improvements or assistant in greenhouses; reference. Address General, care American Gardening.

## BLINDNESS PREVENTED

The Absorption Treatment a Success. Hundreds successfully treated for all diseases of the eyes or lids without knife or risk at their homes and at our Sanitarium, the largest and most successful institution in America. "Don't want to be blind." Pamphlet Free.

THE BEMIS EYE SANITARIUM, Glen Falls, N. Y.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Shifting Chrysanthemums.

In the window, as in the greenhouse, the main point is to keep the plants growing without check. They want rich soil, even and sufficiently abundant watering, and all the fresh air possible. If placed where the windows can stand open night and day, so much the better. Whenever the pots are moderately full of roots, shift into fresh feeding ground. This is to be continued until quite near the blooming season.

#### *Hyalanthus Candicans* in the Window.

This fine summer bulb is behaving in a very satisfactory manner. Potted in June, it has now a blossom stalk of full height, with buds just ready to open. By the first of August it will be beautiful, indeed. The foliage is of noble proportion, equal, or more than equal, to that of the *Amaryllis*—and the blossoms are thrown so high that none of the effect is lost. Altogether, one could hardly think of anything better as a variation from the ordinary run of window plants. Two or three full-sized bulbs in a large pot may make a show fine enough for the most pretentious place. Yet this plant is essentially one for the home gardener with small means, as it grows readily from the seed, which is not expensive, and under good care the bulbs bloom the second year.

#### For Late Autumn Bloom.

If Tuberoses in bud, about the end of August, be very carefully lifted and brought on slowly they will add to the window garden at a season when extra help is much needed and appreciated. Stocks, too, are a good adjunct at this time; sow the seed in August, pot off singly as soon as of sufficient size, and congratulate yourself on your forethought when early winter winds are howling.

#### A General Repair Shop.

Late in summer, when, as so often happens, many of the standbys seem to be failing, a visit to the repair shop will work reparative wonders for them. Verbenas, Phloxes, Lobellias, Pansies, and many another plant that has become sprawling and unkempt may here be carefully pruned of seed pods and decayed leaves, and loosened and enriched as to surface soil. New growth will start as if by magic, and bloom at once follows. If only one or two be put through this process of repair at one time they will scarcely be missed, before they are back in their places, and contributing as of old, to the general beauty. A little liquid manure or fresh soil may also prove a helpful adjunct now.

#### Striking Cuttings.

There are many plants which will come on better for winter use if the cuttings are struck soon, than if the matter be delayed till fall. It is quite true that the majority of plants root more readily and strongly in a cool temperature. But if one wait until fall to strike cuttings, plants will seldom be of much value before spring. One may take advantage of a cool spell, which is almost certain to come some during August, and get the "slips" in then. Geraniums, if wanted for winter bloom, need to be put in thus early, and *Alternantheras* are difficult to start in winter, on account of the low temperature. They are best carried over from the present season, being rooted in August.

#### Proportionate Size of Pots.

This is a point which proves a great puzzle to the novice, who almost invariably uses pots twice too large, or more. It must be that he bases his judgment on the expected, rather than the actual size of the plants; on the size of top rather than the amount of root growth. A large amount of earth in the pot will get and hold more water than a small plant can possibly appropriate. This soil is apt to become soured and sodden, and can be nothing but a detriment to the plant. If the tiny plant

Mention American Gardening when you write

really needs a pot so small that it cannot be easily kept moist during summer heat, it is best to set it within another of larger size, with a loose layer of moss between.

#### An Exhibition Pen.

A certain breeder of exhibition stock reports, in a late issue of Poultry Monthly, that he received in two months, from a show pen containing four females, 183 eggs. This is 45 eggs per hen out of a possible 61 or 62, if they had laid every day. This is good laying, not given as phenomenal, especially; but to show that exhibition stock is not necessarily inferior in egg-producing power. Were it possible to keep it up throughout the year, it would figure up well towards 800 eggs per hen. Generally speaking, that which is possible to the exhibition fowl in this line is more easily possible to the cross-bred fowl, because the latter has the advantage of the extra thrift gained by out breeding.

#### Invalid Poultry Keepers.

It used to be the fashion to recommend poultry keeping as just the one thing for invalids. In these later times we read things like this: "We must caution the invalid, as we would the lazy man or woman, to keep out of the poultry business. We know of no business which is so exacting in its requirements, nor which demands longer hours, nor closer application." Isn't there a middle ground somewhere? And is not the fact that those in the business engage so small an amount of help partly responsible for the long hours and the exactions? With the right kind of help and enough of it, there are many classes of invalids who need not find the business so extremely exacting. But there's the rub. Where can they get that help?

#### Milk for Fowls.

Those who have abundant milk for use in the poultry yard are favored, indeed. It is most excellent for both chicks and fowls, and may supply in large measure the place of meat. The great point to be observed is, that it is not to be allowed to become sour and ill-smelling. Sweet, it may be used either as a drink or for mixing with soft feed. Sour, it is better curdled by heat, when both the thick and the thin portions are perfectly safe to use. But it is well, when using much of the curd, to be sure that the fowls receive, also, some food of a slightly laxative nature. Of these, bran is a familiar example.

#### Fancy Chicks.

It must be highly satisfactory to a breeder of fancy fowls to be able to give a report like the following, taken from a late poultry paper: "Customers state that eggs have been received in perfect condition, percentage of fertility high,

hatches good, and chicks live and thrive." Now all this is just right, and the last is best of all. But it is no better than should be the case in every poultry run, where proper care is taken, and where the size of the breeding yard can be limited to the right number of hens to a cock. The difficulties with infertility, and bad hatches, and dying chicks do not, as a rule, lie primarily with the fowls themselves; but rather with the caretaker who cannot be pushed to the point of doing all the right things to insure success. We insist upon this as a fact.

#### The New Stock.

Princess Alice has, for some time, held the distinction of being the best all around perpetual blooming stock. Perhaps the new class, of which White Pearl is the forerunner, can hardly be called a competitor of Princess Alice, because it is so different in makeup. It is very dwarf and tiny in all its parts. The small and very double flowers of clearest white are very thickly set along the spikes, and it is expected to prove particularly fine for cut flower, or florists' use. Fifty cents a packet may seem a little high to the average grower, but perhaps he will be willing to pay it if he is particularly fond of Stocks. If not, another year will probably bring them to his hand at a lower price. In connection with this new dwarf, it is interesting to note that there are sorts offered this year under the names of Colossal and Mammoth which form the strongest possible contrast to the wee White Pearl.

#### Clean Pots for Thirsty Plants.

The more thirsty a plant is, the more, perhaps, does it need a clean pot, partly because it will have to be watered so frequently, and is thus likely to become clogged. For the same reason, plants of this character like a pot not too close in grain, though it must be said that there are some cheap pots made that are too coarse and porous for any plant that will endure sunshine. For a plant in shade possibly no pot can be too porous.

MYRA V. NOBYS.

#### "The Water Garden."

Owing to the expensive character of this work, the publishers have been compelled to set the price at \$1.50. The volume is now on the press, and every effort will be made to publish it at the date given in the advertisement elsewhere. Orders are coming in rapidly, and all who wish to secure a copy of the first edition should apply promptly. The work, intrinsically, will be of undoubted value, and the typographical appearance of the book itself a magnificent product of the printer's art.

**AMERICAN GARDENING, P. O. Box 1697, NEW YORK****PRIVATE GARDENERS.****Appointments and Doings.**

Gardeners and others knowing of recent appointments and movings are requested to forward particulars of the same for publication in this column. No charge is made.

F. Fowler has been appointed gardener to Mr. Stuttle, Naugatuck, Conn.

Anton Weiss, a landscape gardener and an old resident of Nutley, N. J., has been missing more than a week. He left for New York to transact some business, intending to return the same day. He was known to have about \$100 on him.

**Obituary.**

On July 26 at Chambersburg, Pa., John W. Lawrence died, aged 66 years. He was born at Ryde, Isle of Wight, England, in 1831, and learned his craft under his father. At the age of sixteen he went for two years to Kew Gardens, then for six years at the Royal Gardens, Windsor, having there special charge of growing grapes and peaches under glass. He was for 23 years at Farnham Castle as gardener to the Bishop of Winchester, then for six years gardener at Newstead Abbey, the home of Lord Byron. In 1880 he came to America and carried on his profession at Shippensburg and Harrisburg, Pa., until ill health compelled him to give up the work to which his life had been devoted.

On July 18 at his home in Madison avenue, New York City, John Callaman, aged 50 years, committed suicide by hanging. It is said he had become despondent owing to lack of employment.

**American Institute Fruit Show.**

Professor H. E. Van Deman, Parkesley, Va., will superintend the fruit department of the American Institute Fair to be held in Madison Square Garden, New York city, September 28 to October 23.

Mr. Van Deman was formerly U. S. Pomologist and his close acquaintance with the fruit-growing interests of the country should have good results in bringing forth a good display of fruit.

Mr. E. G. Fowler has had to retire from the position (which he so ably filled last year) on account of pressure of business and failing eyesight, which latter affliction will cause much concern among Mr. Fowler's many friends.

**Pittsburgh, Pa.**

Superintendent William Falconer, of Schenley Park, is on a tour of inspection to eastern parks. He left on July 24 and expects to be away for several weeks, visiting Philadelphia, New York, Brooklyn, Buffalo, and other large cities, for the purpose of inspecting the large public parks to see if he can find any points which would improve Schenley Park, if adopted there.

**Boston.**

The exhibition at Horticultural Hall on Saturday, July 24, was hardly up to the standard at this season of the year. The prizes on cut flowers were for sweet peas and herbaceous plants. The sweet pea prizes were fairly well competed for and were awarded as follows: Display of named varieties, filling thirty vases, arranged with any foliage, first, M. B. Faxon; second, Mrs. H. A. Jones; display of named varieties in vases, six sprays in each vase, first, James Wheeler, gardener to Joseph H. White, Esq.; second, E. A. Weeks; third, Mrs. H. A. Jones. The competition on herbaceous plants was close, and the prizes were awarded as follows: N. T. Kidder (William Martin, gardener), first; Reading Nurseries, second; Carl Blomberg, gardener to Oakes Ames, Esq., third. J. E. Rothwell exhibited a small but interesting collection of orchids, including two or three choice cypripediums. Harvard Botanic Gardens made a fine display of hardy perennials. William Thatcher, gardener to J. L. Gardner, Esq.; James Com-

ley, gardener to the F. B. Hayes estate; James Greene, gardener to James L. Little, Esq., and others made interesting exhibits of cut flowers. Several collections of native flowers were also tabled. Certificates of merit were awarded to James L. Little (James Greene, gardener), for Begonia Haageana, and the Harvard Botanic Garden (Robert Cameron, gardener), for Podophyllum Emodi.

**Orange, N. J.**

The New Jersey Floricultural Society met on Monday, August 2, twenty-five members being present. The proposal to hold a fall show was under discussion, and a number of exhibitors manifested their interest by announcing their readiness to exhibit under any circumstance, and other members showed their willingness to work and help by undertaking to sell from 5 to 20 tickets each, others by a guarantee of \$10 each in case of a shortage; but notwithstanding this, the executive is still confronted with the danger of financial loss, and is very shy of assuming the responsibility of an exhibition on the scale of the last two seasons.

A committee appointed for the purpose has been hard at work trying to make arrangements with some of the institutions of the Oranges, but with very poor results; some ignored the matter entirely, while others wished to shirk all responsibility, yet, on the other hand, want to share in possible profits. The Ladies Improvement Society of the Oranges was the only body that has promised assistance and that was by presiding over booths, etc.

The members present decided to hold a show of some sort, small or large, and left the ways and means open for further consideration. Four new associate members were elected, two of these nominations being presented by Dr. Mandeville.

Mr. A. D. Rose read a paper entitled "Flower Shows," presenting some very forcible truths on how an exhibition should be conducted. He championed the one man judge system, stating that one good man was better than three, whether they were good or bad. Select a competent man and pay him for his work.

**Greenhouse Building.**

Despite the depression of the times the number of new glass structures being erected this season is as great as usual. In fact, several of the prominent builders state that they have been and still are very busy. But there is every indication that so soon as the general business of the country regains its equilibrium there will be a greater rush in greenhouse building than has ever before been known.

Among some of the new houses either already erected or now in course of construction are:

Hon. Gardiner G. Hubbard, West Washington, D. C., one rose house 20x50 feet.

The White House, Washington, D. C.; re building the conservatories.

Mrs. Walker, Waltham, Mass., one house 10x77 feet, and a palm house 30x50 feet.

Mr. Dumaresq, Chestnut Hill, Pa., general house 19x100 feet.

Mr. B. Thayer, Lancaster, Mass., a range of houses.

Mr. A. Mack, Somerville, Mass., a general range of houses.

C. F. Dietrich, Millbrook, N. Y., one house 24x41 feet, one house 62x24 feet, one house 6x62 feet, and a violet house 16x94 feet. These are in addition to a very large range which already exists.

Major L. Ginter, Richmond, Va., one palm and one rose house.

Mr. W. A. Proctor, Cincinnati, O., one octagon, and one general orchid house. The foregoing are the work of Hitchings & Co., Mercer street, New York. Messrs. Lord & Burnham, Irvington, N. Y., have already completed or are building the following:

A substantial addition for J. S. Bailey, Jamaica Plains, Mass., consisting of rose, chrysanthemum, orchid, and other houses.

Mr. Hugh J. Grant, Oradell, N. J., a range of houses.

Davenport, Ia., City Parks, one palm and two propagating houses.

Mr. Richard Mortimer, Tuxedo, N. Y., a general range.

Mrs. A. H. Johns, Bernardsville, N. Y., a general greenhouse.

Mr. H. C. Frick, Pittsburg, Pa., palm house and general range.

Mr. G. W. D. Holloway, Decorah, Ia., one conservatory.

This same firm is also architect for the Horticultural buildings, New York Botanical Gardens, Bronx Park, also for the Horticultural building, Buffalo, (N. Y.) Botanic Gardens, and also for the new conservatory at the Executive Mansion, Washington, D. C.

#### Carnations for Private Use.—Wm. Scott.

On page 526 of AMERICAN GARDENING, Mr. James Hartshorne, Ill., states in response to a request for a list of Carnations for a private place, that William Scott is not as good a flower as Albertini, when it is off crop it keeps off too long, and that it bursts badly in winter.

This may be the case in Illinois, but in New Jersey we raise it for one of the best. I have been cutting from Scott since October, and the flowers are some of the best in the house now. I never had any burst calyx, and it is one of the most constant bloomers I have.

I had Albertini and discarded it on account of its bursting the calyx. This is the first time I have ever heard any fault found with Scott, and I would like to hear the opinion of some of your readers.

—N. BUTTERBACH.

#### Good Paint.

What is the best paint? This is the question the thrifty gardener is constantly asking. Paint is used to protect from decay incident to exposure to the elements, as well as to beautify and renew. The old dingy house can, by the application of a new surface of paint, be to a large extent changed. Paint is not very expensive when you get the best, but the labor of applying it is costly. What, then, is the best paint for wear? What will best preserve from decay and remain unaffected by exposure?

Paint is (or should be) composed of pure linseed oil mixed with certain dry powders or mineral substances, called pigments, which experience has shown are best adapted to this purpose. Paint is applied in a liquid state, and after exposure to the air becomes hard, or, in common parlance, is said to dry. If the dry powder or pigment was applied alone it would soon rub off. If it was mixed with water the water would dry out and the powder would come off, to the disgust of every one.

What is wanted is a binder which will not only harden and dry, but which will embrace the powder or pigment so it cannot be removed. This binding material must be insoluble and practically unaffected by water, else the paint would be washed off the building with the first rain. Pure linseed oil is the best material known. It fulfils the requisite conditions of a binder, or vehicle for paint. When it dries it does not dissipate into the air like water, alcohol, or even coal oil. It does not evaporate at all, but absorbs oxygen from the air, thereby forming a tough, leathery substance which envelops the pigment and holds it to the surface, and if dried under proper conditions, it forms an elastic waterproof coating, adapting itself to the changes of temperature. Therefore, pure linseed oil alone should be used.

What shall be combined with pure linseed oil to make the best paint? The experience of many centuries points to pure white lead. This substance has the faculty of mixing most readily with linseed oil. It assists the oil to dry by combining with it, the oils rendered waterproof and the resulting dry film for a long time remains elastic, so that it adapts itself readily to expansion and contraction of the surface, without a tendency to scale off. Unless there is moisture present, either on the surface or absorbed in the wood, when the paint is applied, pure white lead paint well rubbed in will stay where it is put. If the surface is wet the oil is repelled from it, and a good job

# Potash.

An absolute necessity for every crop.

Mention American Gardening when you write.

cannot be expected. If there is water or sap in the lumber the heat of the sun, or of the building, will draw or drive it to the surface, and blistering will follow. When these blisters are pierced the water will often run out. See, then, that the surface is all right before you paint. If very old and dry, the oil may be absorbed before it can set or dry, and the pigment left as a dry powder, so that in the first coat plenty of oil should be used, not only to act as a binder, but to allow for possible absorption.

There are additional reasons why pure white lead is the best pigment. Among others, it has greater opacity than any other substance, therefore hiding the surface better; consequently fewer coats are required. We have said that the cost of paint is not very great, but it is the labor of applying that is expensive. Therefore, when you can cover as well with two coats of white lead paint as with three or four coats of other paint, it follows that the lead paint is the cheapest by far. Any substance that is added to white lead, except for the purpose of coloring, diminishes in some way the value of the paint. Zinc is sometimes used. Now zinc is very inferior in covering to white lead, and besides, in drying it forms with the linseed oil a very hard, unelastic surface, which is apt to crack and scale off. When repainting becomes necessary, the surface is such that it will not readily hold the new coat, so that the entire lot of old paint has to be burned off, a very expensive operation, if a first-class job is wanted.

The substance most commonly added to white lead is barytes, and it is added simply because it is cheap, and to make weight. Barytes is a powdered rock, which is found largely in Virginia, Missouri, and other parts of the country. It is not opaque and has no action in the oil, and if ground or mixed with oil alone it will neither cover nor hide the under surface, nor form an elastic waterproof binder with the linseed oil, which we have heretofore described.

Within the last fifteen or twenty-five years a large demand has been created

for what are known as "ready mixed paints," or paint prepared with oil and drier ready for use, which appeals to the user as a great convenience. Some makes of these appear to give fair satisfaction, but the very general complaint as to their want of durability has caused the whole class to fall somewhat into disrepute. The cause for this is not hard to find. We have previously shown that the base of the best paint for general use should be pure white lead and pure linseed oil. Now white lead in its nature is so heavy an article, so dense are its particles (it is this that gives it its great value as a covering pigment) that it cannot be held in suspension for any length of time in pure linseed oil. As a matter of fact, most ready mixed paints contain but little white lead, other and cheaper substances, inferior as pigments, being substituted therefor, and in order to enable the paint to dry quickly various driers containing turpentine and benzine are introduced. The effect of these is to thin the oil and render it less capable of holding the various pigments in suspension. To counteract the tendency to settle, the oil is treated to make it thicker, alkalies and water which form soap or emulsions with the oil being frequently used. It is not difficult, then, to see why such paints so often prove disappointing to the user; nor does the expense stop here, because if he desires to repaint with a pure article and secure the best results the old coats must first be entirely removed.

The moral of all this is, the best is the cheapest in the long run. Better results are obtained, greater durability and satisfaction, besides at the present time the best is actually the cheapest. Any one desiring to use paint can buy absolutely pure white lead, under the guaranty of a responsible manufacturer, pure linseed oil, equally guaranteed, and pure colors, and can mix them himself ready to use at a no greater cost per gallon than inferior articles, which do not cover nearly so much or so well.

Why, then, not always buy the best, the very best?—J. A. S. in the Independent.

# WHOLESALE MARKETS.

## New York.

Business can only be spoken of as being fair. Large bulks are difficult to move and prices are inclined to fall rather than rise.

Potatoes which so far have been good property are weakening in price, \$2 per barrel for either Long Island or Jersey is top notch or fancy price, the bulk of the sales being made between 75c. and 87c. per barrel.

Tomatoes are still poor, both in appearance and quality and low prices prevail; there is room for more highly colored ripe fruit, and these would make fair prices.

Muskmelons are still dragging with prices low and irregular.

Hothouse grapes are selling slowly at from 50c. to 75c. per pound.

Good mushrooms are in demand for a limited quantity.

Apples—Nyack Pippin, hand-picked, per barrel, \$1.50@2; Bough, hand-picked, per barrel, \$1.25@1.50; Astrachan, hand-picked, per barrel, \$1.25@1.75; near-by, windfall, per barrel, 50c.@\$1; Southern, per crate, 25@60c.

Peaches—Georgia and South Carolina, fancy, per carrier, \$2.25@; good to cheap, per carrier, \$1.25@2; poor to fair, per carrier, 50c.@\$1; North Carolina, poor to choice, per carrier, \$1@2; Virginia Troths, per carrier, \$1@1.50; Maryland and Delaware, early, per crate, 75c.@\$1.25; early, per basket, 50c.@\$1; Jersey, early, per basket, 25@75c.

Pears—Bartlett, Virginia, per box, \$1@1.25; Jersey, per barrel, \$1.50@2.50; up-river, per barrel, \$1.50@2; Clapps, up-river, per barrel, \$2@2.50; per keg, \$1@1.25; Bell, nearby, fair to prime, per barrel, \$1.50@1.75; Keffler, southern, per barrel, \$1.50@2.50; Le Conte, southern, poor to fancy, per barrel, \$1.50@3.50.

Grapes—Delaware, North Carolina, per 24-pound case, \$1.25@1.75; Niagara, North Carolina, per 24-pound case, \$1.25@1.75; other white, North Carolina, per 24-pound case, \$1@1.50; Moore's Early, North Carolina, per 24-pound case, \$1@1.50; Champion and Ives, North Carolina, per 24-pound case, 75c.@\$1.25; North Carolina, per 10-pound basket, 10@25c.; Delaware, South Carolina, per 24-pound carrier, \$1@1.25; white kinds, South Carolina, per 24-pound carrier, \$1@1.50; black kinds, South Carolina, per 24-pound carrier, \$1@1.25.

Plums—Wild Goose, per quart, 4@6c.; Wild Goose and other table varieties, per eight-pound basket, 25@50c.

Apricots—New York state, per eight-pound basket, 20@25c.; per five-pound basket, 10@15c.

Currants—Large red, per quart, 2@5c.; bulk stock, per pound, 2@4c.

Blackberries—Up-river, per quart, 5@8c.; Monmouth Co., Jersey, Wilson, per quart, 3@6c.; South Jersey, cultivated, per quart, 3@6c.

Huckleberries—Shawangunk Mountains, per quart, 7@8c.; Pennsylvania, blue, per quart, 6@8c.; Jersey, per quart, 4@6c.; Southern, per quart, 3@6c.

Raspberries—Up-river, red, per pint, 3@8c.

Melons—Watermelons, South Carolina, per 100, \$10@20; watermelons, North Carolina, per 100, \$8@15; watermelons, Virginia, per 100, \$7@14; muskmelons, Maryland Gem and J. Lind, carrier 50c.@\$1; per one-half barrel basket, 50@75c.; Norfolk Gem and J. Lind, barrel, 75c.@\$1.50; Norfolk Gem or J. Lind, carrier, 50@75c.; Norfolk and North Carolina, bushel basket, 30@60c.; Norfolk and North Carolina, per barrel, 50c.@\$1; Norfolk, Christina, per barrel, \$1@1.50; Baltimore, Gem, and Lind, basket, 40@50c.

Celery—Fancy large, per dozen, 50@60c. fair to prime, per dozen, 20@40c.; small and poor, per dozen, 5@15c.

Corn—Hackensack, per 100, \$1.25@1.50; other Jersey, per 100, 50c.@\$1.25.

Cabbages—Jersey and Long Island, per 100, \$2@3.50.

Cucumbers—Jersey, per barrel, \$1@

1.50; Jersey, per bushel box, 50@60c.; Norfolk, per barrel, 75c.@\$1.25; cucumber pickles, Jersey and Long Island, per 1,000, \$1.50@2.50.

Egg plants—Jersey, per barrel, \$1.75@2.50; Jersey, per bushel box, 60@75c.

Green peas—Western New York, per bag, \$1@2.50.

Lima beans—Maryland, per one-half barrel basket, \$1.50@2.50; Jersey, Potato, per bag, \$2@3; Jersey, flat, per bag, 75c.@\$1.37.

Onions—Maryland, Virginia, and North Carolina, one-half barrel basket, \$1@1.25; Virginia and North Carolina, per barrel, \$2@2.50; Jersey white per barrel \$3@3.75; Jersey white per basket \$1.25@1.75; other Jersey per barrel \$1.50@2.50; Orange County red per bag \$1.75@2.25; Connecticut red per barrel \$2.25@2.50.

Peppers—Jersey, per barrel, \$1@1.25; Jersey, per box, 40@60c.

String beans—Long Island, per bag, \$2@2.50.

Squash—Marrow, per barrel crate, 75c.@\$1.25; yellow crook-neck, per barrel, 50@75c.; white, per barrel crate, 50@75c.

Tomatoes—Monmouth County, Jersey Acme, per box, 50@75c.; other Monmouth Co., Jersey, per box, 20@40c.; south Jersey, Acme, per box, 50@60c.; other south Jersey, per box, 20@35c.; Philadelphia, per basket, 10@20c.; Maryland, per carrier, 25@75c.; Norfolk and North Carolina, per carrier, 40@60c.

Turnips—Russia, per barrel, 50@75c.

## Boston.

Fairly large receipts of watermelons; general stock selling 12@15c.; with fancy large good demand 17@18c. Cantaloupes are in full blast, every receiver has them; stock, as might be expected, better than last week; nearly all coming from Virginia in the bushel baskets bring 35@45c.; in barrels or barrel crates \$1.

Some fine hothouse melons grown from Montreal seed and weighing about 20 pounds each, bringing \$1@1.25 each; readers will understand it is only the very wealthy or high-priced hotels that can afford to purchase at such figures. The biggest one weighed so far, touched the scales at 22½ pounds! It was grown under glass by one of our near-by farmers, who last year purchased a melon direct from Montreal, saved the seed, and is now getting his harvest.

North and South Carolina grapes are in very good demand. High-colored Delawares \$2 a carrier; poor color, \$1.50; Concordes, \$1@1.25; Niagara, \$1.50 a carrier.

Hothouse black Hamburg grapes, 25c. a pound, in light demand.

Green corn quite plenty, 18@25c. per dozen; all the restaurants have it and it tastes mighty good.

Green peppers, 25c. a dozen.

Some Georgia Elberta peaches, fancy, bringing \$2.25@2.75 a carrier.

New Hampshire blueberries find a large sale at 10@12c. a quart; native blackberries are in as good demand at 10@12c., while the Jersey stock does not slide so easy even at 5@8c.

Mushrooms dull, stock generally very poor; a few fancy meet a fair sale.

Native celery (started under glass), \$1.50 a dozen; round radish, 10@15c. dozen bunches; beets, plenty and dull at 25c. a bushel; with turnips in very good demand, 50@75c. a bushel.

Summer squash, 2@3c. each; it has not been a good season, therefore those who have any are getting very good returns.

High-colored marrow squash, quick demand, \$1.75 a barrel.

Peas from Portland are pleasing the trade at \$3 a barrel.

String beans generally poor, some small pickling stock, \$1.50 a bushel. There is a ready sale for shell beans at \$1.50 a bushel.

Potatoes are easier by 75c. a barrel; best stock early this week quoted \$2.50@2.75; it is not believed any large quantity will be put on this market, therefore every one is looking for a good healthy demand for potatoes during the next four or five weeks.

Few Virginia yellow sweets on the

(Continued on next page.)

# AGENTS WANTED.

Read this partial description of the best book of the kind for women which has ever been published, then write us for terms and territory.

## HOUSE PLANTS

AND

## HOW TO SUCCEED WITH THEM.

BY

LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when noting with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to baffle beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"HOUSE PLANTS" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "House Plants" will take its position second only to the much prized and ever handy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fall.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done if my instructions are followed."

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. Those silent monitors, the flowers, are not dumb, but speak to us through the delicacy of their scents, their intricate shapes, complex habits, and the glorious penciling of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

market, about \$3.50 a barrel; little more size would be beneficial; red sweets steady at \$3 a barrel.

Cucumbers are strong at 2½c. each for good stock; seconds are dull and in light demand.

Yellow turnips, whether from Jersey or near by, are quickly taken at \$1.50 a barrel; practically no difference in the quality. Egg plant quiet; \$1.50 for the three-peck box.

Cauliflowers are poor, having very little head; dangerous to quote, but some one ones bring \$1.50 to \$2 a dozen.

A good many Illinois tomatoes are now arriving and bring 50¢@60c. a crate; hot-house stock, 10¢@15c. a pound; with some home-grown stock, \$2.50@3.50 a bushel.

New parsnips, \$1 per dozen bunches; new carrots, 8¢@5c. a bunch; near-by onions brought in every morning bring \$1 a bushel; western New York stock, \$2.25 a barrel.

Very healthy demand for new apples; new Astrachans, \$2@2.25 a barrel; some fancy stock \$2.50@3; half-barrel basket, Jersey, \$1@1.25; some Massachusetts Williams not quite up in color, 75c.¢\$1; if higher color, could quote \$1.25@1.50 a bushel.

There are a few pineapples around, but the bulk of the crop has been gathered in.

Parsley worth 50c. a bushel; mint, 35c. dozen bunches; garlic, 6¢@10c. a bunch; cabbage, 2½¢@3c. each.

No muskmelons on the market; the storms have about killed the currant and raspberry crop, and there is a better demand for currants, but few are offered at 8c. a quart; red raspberries 8¢@10c. a pint; no demand whatever for blackberries or raspberries.

Arrivals of Le Conte pears mostly show very poor condition; those which are about perfect bring \$3 a barrel.

Estimates have been made and given regarding apple crop of New England; Maine, New Hampshire, Massachusetts,

and Rhode Island have been directly heard from, and if we say there is one-fourth of a crop we are giving a correct idea as trees hang to-day.

E. F. Landis of Model City, N. Y., is introducing a new barrel which he claims, exceeds anything ever produced.

### Philadelphia.

This market has cleared up well during the past week. On every day a very large stock has been on hand of both fruit and vegetables and buyers have been plentiful.

Peaches have fallen off in supply, and only a small percentage have been No. 1 stock.

Cantaloupes have been very plentiful, the best have been from Georgia, but prices rule low. Many Jersey melons have come in, but are not ripe enough.

Blackberries are falling off in quantity. Apricots from the Seneca Lake district have arrived; these are mostly small and have traveled poorly and sold at 15¢@20c. per basket of six quarts.

Apples—Hand picked, per barrel, \$1.50 @2; windfall per barrel, 40¢@75c.; Delaware and Maryland, per crate, 60¢@70c.

Pear—Le Conte, Georgia, per barrel, \$2@2.50; per basket, 75¢@90c.

Peaches—Georgia, per crate, \$2@2.75; fair to good, per crate, \$1.25@1.75.

Blackberries—Jersey, cultivated, 4¢@7c. per quart.

Huckleberries—Jersey, 5¢@7c. per quart; Delaware and Maryland, 4¢@6c. per quart.

Melons—Watermelons, South Carolina, fancy, per 100, \$25@30; fair to good, \$10@15; muskmelons, Georgia, per barrel, \$1.25@1.75; per basket, 50c.; Norfolk, per barrel, 75c.¢\$1.50; per basket, 35¢@50c.; Jersey, Jenny Lind, per basket, 40¢@60c.

Corn—Jersey, per 100, 80c.¢\$1.30.

Celery—Fair to good, per dozen, 25¢@40c.

Egg plant—Jersey, choice, 80c.¢\$1.25

per basket; fair to good, per basket, 50¢@75c.

Lima beans—Maryland, per one-half barrel basket, \$1.75@2.25; Jersey, per basket, 40¢@60c.

Onions—Maryland, silver-skin, per one-half barrel basket, 75¢@90c.; Jersey, white, per barrel, \$2.75@3.50; Jersey, common, per basket, 60¢@80c.

Peppers—Jersey, per crate, 50¢@75c.

Squash—White, per barrel, 60¢@75c.; marrow, 50¢@60c.

Tomatoes—Jersey have fallen in price very much this past week, and the market has been glutted with so much unripe fruit. On Saturday stock could be bought at from 10¢@20c. per basket. This week prices have gone up a trifle; choice fruit selling at from 40¢@50c. per basket.

Potatoes—Jersey, per basket, 45¢@60c. and selling well.

### Plants Named.

[Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.]

During a trip in the woods, I discovered a few strange flowers which I send you, and would like name and order. There were five or six flower stalks in a clump with no other foliage or stems, color perfectly white, although similar in substance to a potato sprout grown in a dark cellar. They grew in very open woods and were in full sunshine.—A. I. WILLIAMS.

—The plant sent is the Indian Pipe or Corpse plant (*Monotropa uniflora*; N. O. Ericaceae). It grows on roots of other plants as a parasite, not uncommon. = (To William Goldthwait)—*Spiraea sorbifolia*.

(To C. J. R. N., Canada)—The leaf is evidently taken from a young growth of some Maple, but without fuller material, specific identification is not possible.

TO BE PUBLISHED AUGUST 20.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

This work will contain nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo. Price, \$1.50.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present increasing popularity of the Water Garden is largely due, is intended to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The work should find a place in every library and in the home of all gentlemen interested in gardening; it will prove indispensable to the private gardener, whether he is at present cultivating an aquatic garden or with a view of preparing himself to take charge of one at any moment. It is scarcely necessary to dwell on the value of the book to the commercial man; every one in trade will require it.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A full descriptive list of Nymphæas and all other water plants, as well as of all trees, shrubs, etc., adapted for marginal effects, is included.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is an index of our subscribers' interest in the paper.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call to push circulation. Understanding thoroughly the value of the paper to every one interested in gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER PREMIUMS SUMMER

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us AT LEAST one new subscriber before the close of the season.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only seven new subscriptions at \$1.00 each.

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Beautifying Country Homes.** By J. WEIDEMANN. A handbook of landscape gardening. This is the most elegant and useful work on the subject ever issued in this country. It is beautifully illustrated with numerous fine wood engravings, and with 17 full-page and 7 double-page colored lithographs of places already improved. It contains general directions for lawns, roads and drives, walks, hedges, trees and shrubs, gardens, ornamental grounds, hints on burial lots, etc., etc. The beautifully colored plans of improved places are accompanied by descriptions giving the names and positions of the various trees and shrubs employed in planting, thus providing a complete planting map. Cloth, 4to. Reduced from \$15.00 to \$10.00.

*Given for 20 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. *Handsomely illustrated, cloth, 12mo. \$2.00.*

*Given for 5 new subscriptions at \$1.00 each.*

**Canning and Preserving Fruits and Vegetables, and Preparing Fruit Pastes and Syrups.** By ERMENTINE YOUNG. This work gives a full account of the best methods by which the surplus fruits may well be saved for home use and for the large market demand, and a handsome profit accrues

to the home workers. A practical chapter on evaporation of fruits is embodied in the book. Paper, 20 cents.

*Given for 1 new subscription at \$1.00 each*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases, dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo., cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit and Fruit Trees of America,** or the culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. By A. J. DOWNING. Second revision and correction, with large additions. By CHARLES DOWNING. This work has no equal in the country, and deserves a place in the library of every pomologist. It gives descriptions of all the finest varieties of fruit, native and foreign, cultivated in America, and contains the names and synonyms of over 10,000 varieties. Over 1100 pp., with several hundred outline engravings, including supplements. 8vo., cloth. \$5.00.

*Given for 12 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Grape Growers' Manual.** (The Bushberg). An exhaustive work on the cultivation of the grape, with accounts of diseases, insects, etc., by specialists. The descriptive list of varieties is specially useful and complete; the typographical method of designating importance of varieties is a feature. Pp., 200. Royal 8vo. Illustrated. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Gardening for Pleasure.** By PETER HENDERSON. New and enlarged edition. A Guide to the Amateur in the Fruit, Vegetable and Flower Garden, with full directions for the Greenhouse, Conservatory and Window Garden. This is a complete encyclopedia of horticultural information, treating on soils, fertilizers, the lawn, garden designs, culture and care of plants, greenhouse building, heating, cottage and window gardening, the orchard, and many other important subjects. A monthly calendar of operations is also appended, which will act as a first-class guide to the amateur horticulturist. Illus., cloth, 12mo. \$2.00.

*Given for 4 new subscriptions at \$1.00 each.*

**Gardening for Profit.** By PETER HENDERSON. A guide to the successful culture of the Market and Family garden, profusely illustrated. Although written mainly for the market gardener, the amateur interested in vegetables or fruits can easily adapt its teachings to the smallest requirements. Cloth, 12mo. \$2.00.

*Given for 4 new subscriptions at \$1.00 each.*

**Greenhouse Construction.** By PROF. L. R. TAFT. A complete treatise on Greenhouse structures and arrangements of the various forms and styles of Plant Houses for professional florists as well as amateurs. All the best and most approved structures are so fully and clearly described that anyone who desires to build a greenhouse will have no difficulty in determining the kind best suited to his purpose. The modern and most successful methods of heating and ventilating are fully treated upon. Special chapters are devoted to houses used for the growing of one kind of plants exclusively. The construction of hotbeds and frames receive appropriate attention. Over one hundred excellent illustrations, specially engraved for this work, make every point clear to the reader and add considerably to the artistic appearance of the book. Cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**How to Grow Cut Flowers.** By M. A. HUNT. A thoroughly practical treatise on the cultivation of the Rose and other flowering plants for cut flowers. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**How to Know the Wild Flowers.** By MRS. WILLIAM STARR DANA. A guide to the names, haunts, and habits of our common wild flowers. The most handy and easy reference book for amateurs. With 100 illustrations by Marlon Satterlee. 12mo. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Henderson's Handbook of Plants and General Horticulture.** By PETER HENDERSON. This has long been acknowledged as the standard American work on general horticulture, giving history geographical distribution and cultural directions for all cultivated fruits and flowers. Illustrated. Cloth, 8vo. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Insects Injurious to Fruit.** By PROF. WM. SAUNDERS. A work of great value to all fruit growers, written by a man of science as well as a practical agriculturist, and the result of careful and minute observations and experience. It treats, under separate chapters, of the injurious insects which prey upon our fruit trees, vines and bushes, together with their mode of operation, and contains careful directions as to the best means of destroying them. With over 400 pages, 440 illustrations. 12 mo. Cloth. \$2.00.

*Given for 5 new subscriptions at \$2.00 each.*

**Johnson's Gardener's Dictionary.** This is a new and revised edition, greatly enlarged, of "Johnson's Cottage Gardener's Dictionary," first published in 1846; containing a full and reliable list of every plant in cultivation, names printed in bold type, rendering reference easy. An important feature of the work is the placing of synonyms alongside the correct name, instead of in a separate list. The habitat of each variety is given along with the date of its introduction. The cultural directions are brief and to the point. Insect foes, diseases and their remedies are fully described, and figures of some of the former have been given. Handsomely bound in one volume. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Landscape Gardening or How to Lay out a Garden.** By EDWARD KEMP. Intended as a guide in choosing, forming or improving an estate (from a quarter of an acre to a hundred acres in extent), with reference to both design and execution, with numerous fine wood engravings. Cloth, 12mo. \$2.50.

*Given for 6 new subscriptions at \$1.00 each.*

**Parsons on the Rose.** By SAMUEL B. PARSONS. New and revised. A treatise on the propagation, culture, and history of the Rose. Illustrated. \$1.00.

*Given for 3 new subscriptions at \$1.00 each.*

**Peach Culture.** By JAMES ALEX. FULTON. New, revised, and enlarged edition. The only practical guide to Peach Culture as followed on the Delaware Peninsula, but essential to those cultivating this fruit in any other part in the United States. Fine cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Popular Flowers and How to Cultivate Them.** By E. S. RAND, JR. Illustrated. New edition, with appendix, revised and enlarged. Crown, 8vo. \$2.00

*Given for 5 new subscriptions at \$1.00 each.*

**Poultry Culture.** By K. FELCH. How to raise, manage, mate and judge thoroughbred Fowls. Cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Practical Floriculture.** By PETER HENDERSON. A guide to the successful propagation and cultivation of Florists' Plants. As in every work from this gifted author's pen nothing has been left unsaid that bears on the subject. Illustrated. Cloth, 12mo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Profits in Poultry.** Useful and ornamental breeds and their profitable management. This excellent work contains the combined experience of a number of practical men in all departments of poultry raising. It is profusely illustrated and forms a unique and important addition to our poultry literature. Cloth, 12mo. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Secrets of Rose Culture.** By W. J. HATTON. In this neat volume are described all the newest and most improved designs for building rose houses, heating, ventilation, management, and much other valuable information on rose culture. The latest and best varieties of roses for every purpose and condition are named, and their special values pointed out, 162 pp. Illustrated, 12mo., paper. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Strawberry Culturist.** By A. S. FULLER. Containing the history, sexuality, field and garden culture of strawberries, forcing or pot culture, etc., fully illustrated. Flexible cloth, 12mo. 25 cts.

*Given for 1 new subscription at \$1.00 each.*

**Success in Market Gardening.** By W. W. RAWSON. Illustrated. This work is written by one of the most successful market gardeners in New England, who gives here the results of his life-long experience in the growing of vegetables out-of-doors and under glass, with special adaptation to the climate of New England. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Art of Propagation.** By J. JENKINS. A concise, practical treatise on the rapid multiplication of vines, plants, trees, etc., detailing the management in propagation of seeds, bulbs, cuttings, etc., and the manner of operating in grafting, budding, inarching, etc. Ample illustrated. 30 cents.

*Given for 1 new subscription at \$1.00 each.*

**The Amateur Orchid Cultivators' Guide Book.** By H. A. BURBERRY, F. R. H. S., orchid grower to the Right Hon. Jos. Chamberlain, M. P. Tells how to grow Orchids, in cool, intermediate, or warm houses, successfully. There is a calendar of operations for each month, and full information as to the treatment required by all orchids mentioned in the book. Just published. New edition, colored plates. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**The Nursery Book.** By PROF. L. H. BAILEY. This is a complete handbook of propagation of plants treating on seedage, separation and division, layerage, cuttage, graftage, including grafting, budding, inarching, etc. It tells plainly and briefly what everyone who sows a seed, makes a cutting, sets a graft, or wants to know. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

# A YARD OF ROSES.

Copyright, 1896, by O. D. Gray, New York.

The illustration but faintly represents the beauty of this celebrated painting by the well-known artist, Mr. Newton A. Wells. The grouping and coloring has been performed with exquisite taste, and the reproduction we offer is worthy a frame, and a position on the wall of any one's room. This sketch, in eleven colors, is 36 inches long and ten inches wide, on heavy drawing paper, and sells in the art stores of New York for fifty cents. We will send "A Yard of Roses," securely packed in a tube to prevent injury, postpaid, as follows:

To all renewing their subscription and adding five cents to pay postage and packing.

To all sending us \$1.00 for their own renewal subscription and 75 cents for the subscription of a friend, we will send "A Yard of Roses" free and postpaid, as a premium to both addresses.

FIG. 157.—ARTISTIC EFFECT OF ROSES GROWING NATURALLY. (See page 566)

### Roses on the Clothes Post.

Many city lots are rendered yet smaller in appearance by four or six sentinel posts, supporting inartistic lines of sagging rope. And in my own place, though a trifle larger, I determined to be rid of them at any cost. Pondering over the problem, I at length solved it. The wooden clothes-line posts were dug up and carried to the wood pile; they will do for kindlings.

Sending for the blacksmith, I instructed him to make some iron posts of two and a-half inch gas piping 10 feet long. Each of these, when finished according to directions, was as follows: Two legs or struts of angle iron, two feet long, placed at an angle of about 45 degrees downward, strongly bolted to the iron post at a point two feet above its base. These struts, which are each shod at the end with a square or shoe of iron, are intended to bear the principal strain upon the post, and keep it upright.

A flat iron strip, about a quarter of an inch thick by an inch wide, is riveted to each side of the post near the top; they are then sprung out in a heart-shaped curve—the two pieces giving a span of six feet at their greatest width apart—and brought gracefully down to the point where the post enters the ground; here they are securely bolted against the sides. Horizontal strips of lighter rounded iron run across this heart-shaped span at distances some 10 inches apart. The top of the post ends in a round ball, and on the face of the post, at the point where the heart shape rises and curves outward, is a stout hook well turned up.

That part of the trellis which will be above ground, is painted a very dark inconspicuous green. The underground portion is protected against rust by metallic paint. The lower end is firmly embedded in the soil to a depth of two feet. Against the square shoes a convenient boulder has been placed; and likewise another boulder at the foot of the post, on the side opposite that on which the line will pull. In filling in, the earth was carefully pounded.

All the posts or trellises, now complete, are stationed at suitable distances around the inner edge of a carriage drive which skirts the lawn; they are, therefore, on the outer margin of the lawn, which is left free and clear. The hooks on the trellis posts all face inward over the lawn.

At the foot of these trellises are planted the hardiest of monthly blooming climbing Roses; and when they are a mass of flowers from bottom to top, as they are the greater part of the season, I feel rather elated at an achievement which elicits praise from all beholders.

Should some untoward winter destroy the cherished climbing plants, I shall only have to purchase new ones, trusting that before this occurs, industrious hybridizers will have produced more blooming climbers that will be entirely hardy. As it is, these so-called partly hardy ones which I use, give me but little trouble and the greatest satisfaction.

Coming as I do from a land where we have flowers outdoors nearly all the year, I sometimes lose patience with the scentless hardy running Roses generally grown North, and blooming only in June. I use Gloire de Dijon, William Allen Richardson, Waltham Queen No. 3, Marie Lavelly, an excellent variety, Caroline Goodrich, Fursten Bismarck, and Marie Henriette. These are heavily mulched with long manure, two or three feet around the base or roots. The tops are laid down and well protected with leaves and a light covering of manure to keep them in place. This, however, should not be done too soon; moderate cold does not injure them.

LIZZIE PAGE HILLHOUSE, N. J.

—Our illustration fig. 158, shows the

construction of the trellis as above described, and is reproduced from the author's "House Plants." On the first page of this issue we present a view in Mrs. Hillhouse's garden which gives some idea of the graceful effect that may be had from allowing a rose to ramble in its own wild way on a suitable frame. It is a matter of much wonder that such graceful and charming effects are not more often reproduced in the thousands of gardens where such could be so easily done.

### The Apple Shippers in Convention.

More than half a hundred members of the National Apple Shippers' Association were present in the parlors of the Hotel

FIG. 158.—AN IMPROVED CLOTHES POST.

Iroquois, Buffalo, N. Y., when President E. P. Loomis called the convention to order at eleven o'clock, August 5. The representative of American Gardening, however, soon discovered that these people are a rather exclusive set, and they came out in broad hints that outsiders are not wanted. The chairman of the executive committee, who evidently had the sympathies of his hearers, stated that the National Apple Shippers' Association is not a philanthropic society, that the public at large has nothing to do with its aims and efforts, and that the members come together for the furtherance of their private ends and purposes. The members claim to have handled about two-thirds of last year's enormous crop, estimated by them at about 75,000,000 barrels. What they evidently are aiming at, is to make the most money out of the business of distributing the apple crops of the country, without regard to the interests of the growers, or of the consuming public either. The association, indeed, is so exclusive that they have rejected many applications for membership, simply on

the ground that the applicants were not making a big enough business of handling apples. Their chief discussions are not for the public, but are reserved for executive sessions. In one sense this policy seems short-sighted. The shippers surely depend on the growers, and both might well work together for their common welfare and interest. Surely it is for the advantage of the shipper to have the grower know what kinds of apples are wanted, and how they should be handled and packed so as to induce the buyer to pay the best prices for them.

#### President's Address.

President Loomis, in his annual address, referred to the role the apple played in history and legend, beginning with Adam and Eve, and of the great modern development of the apple industry. Forty years ago the apple trade was very insignificant. Then any kind of package, and any kind of apple was good enough. Now we want a well-made barrel of accurate measurement, and only the finest fruit. The increase of the business has been steady and enormous. There are thousands of modern cold storage houses in which millions of barrels are held for long periods and better prices. The Albemarle Pippin, as grown in Virginia, is considered the finest of all apples, and most in demand. At least, it brings the highest price in the English market. The president states his belief that in California a 1,000-acre Spitzenburg apple orchard would yield the income of a California gold mine. He also warns against holding apples for export until spring, when there is competition in the English markets from other foreign countries. The outlook for an apple crop and a paying market this year is good. Poor stock, poor packing, and other mistakes in handling the crop have been the great difficulties to be overcome. The address was received with great favor.

#### The Present Apple Crop.

The secretary estimates this year's crop in the United States to be about 60 per cent. of a full crop. The quality is promising. Letters from various prominent applemen were read. English dealers state that the shipments, last season, were not in excess of the consuming capacity of the English people. The trouble was the poor stuff, poor packing, poor carrying facilities, poor ventilation, and want of cold storage.

### The Vegetable Garden.

**Beans.**—If a sowing of the Early Valentine wax be made now, the pods will be ready for use in the fall when fresh vegetables will be getting scarce.

**Turnips.**—This is the proper time to sow early turnips and rutabagas on spare ground for winter use. The ground for these is to be thoroughly rolled at this season after the seeds are sown, or seeds may not germinate freely.

**Radish.**—Sow in succession every ten days for fall supply. To grow good radishes, the ground should not be allowed to become dry, otherwise they will be tough.

**Lettuce.**—We generally sow a quantity of this now. We prefer the three varieties—Trianon Cos, Golden Queen, and Curled Silesia or Simpson; the Trianon Cos frequently grows much finer during the cool nights of September than at any other time of the year.

**Corn Salad** may be sown now.

**Endive.**—To blanch fit for use, tie up the leaves while dry, or simply cover over with a board for a few days.

**Cardoons.**—A portion should now be ready to be tied and earthed up to blanch in much the same way as celery. When blanched this is a delicious vegetable and enjoyed by many.

W. M. EDWARDS, Conn.

### Some Newport Gardens.

The famous Rhode Island summer resort, where wealth and fashion annually disport themselves during a part of each season, is always looked at by garden lovers with certain longings. For its size, it has a multitude of gardens, some very fine, some of but average merit, but, as in

three miles with none to molest or make afraid.

To a stranger the wonder is how it happens that such a walk through some of the finest gardens in the country came to be and to continue all these years. The Newport millionaires who build palaces on these cliffs and call them "cottages," do not open their grounds thus

Charles II., bearing date July 8, 1668, and which was continued as the constitution of the state down to November, 1842, and some of whose peculiar features are still in force. The grant thus made did "ordain and appoint that these presents shall not in any manner hinder any of our loving subjects, whatever, from using and exercising the trade of fishing

FIG. 159.—THE CLIFF WALK, NEWPORT. R. I

all other things, the reputation is of the few, not of the many, and the few are well worth a visit.

The Newport Cliff Walk, shown in fig. 159, is one of the principal attractions of the place. It is open to every one who chooses to enter, and though extending along the borders of private grounds can be traversed its entire length of nearly

to the public of their own sweet will, and yet there is not a person on earth aside from themselves who can justly claim title to this walk or show a legal claim for his right of occupancy. But in Rhode Island every citizen claims the right to visit the shores and claim a part of the ocean at least as his own. This doubtless came about from the grant of King

upon the coast of New England in America; but that they and every one of them shall have free and full power and liberty to continue and use the trade of fishing upon the said coast, in any of the seas thereto adjoining, and any arm of the seas or salt water, rivers, and creeks where "they have been accustomed to fish," etc. And there is a deed of convey;

FIG. 160.—HEDGE OF ROSA RUGOSA IN A NEWPORT GARDEN.

ance from one of the early settlers of the island covering the farms of this very cliff, which reserves the right to fishermen to spread their nets on these shores in the prosecution of their "profession."

Newport is famous for its hedges and clumps of *Rosa rugosa*; here the rose is frequently used as a wind break, and is found to stand admirably the winds and gales of the sea. The accompanying picture (fig. 160), shows a hedge of the same in the grounds of Robert Goellet, (P. Carr, gardener).

A noble residence and garden is that of Mr. G. P. Wetmore. The trees and shrubs here show the advantage of age, also the great care that has been taken of them by the veteran gardener, Robert Christie. The excellent bed of *Azalea amena* in flower, as seen in (fig. 161) is a type of what may be seen here in other places. Mr. Christie of late years has devoted a good deal of attention to Cannas,

terson); Mrs. H. H. Brooks (gardener, James Hill); I. T. Burden, Esq., (gardener, W. S. Nicoll); J. W. Ellis, Esq., (gardener, Alexander MacLellan); Mrs. J. M. Fish (gardener, Charles D. Stark); Ogden Goellet, Esq., (gardener, J. R. Johnson); J. P. Kernochan, Esq., (gardener, P. Reynolds); Mrs. P. Stevens' estate (gardener, S. Peck); C. Vanderbilt, Esq., (gardener, R. Lawrie); F. W. Vanderbilt, Esq., (gardener, R. Hinnick), and W. S. Wells, Esq. (gardener, A. S. Melkie).

### The Fruit Garden.

**Pears.**—Margaret, or Petite Marguerite of some growers, is one of the very best of the early kinds; not for commercial purposes though, it having no particular beauty to make it sell at a season when Bartlett's are everywhere in the

### FRUITS OF EXPERIENCE.

#### JOTTINGS FROM OBSERVATION.

Too much cannot be said about keeping the surface broken up around the berry plants, except raspberries, now.

We will now slack up on cultivating the two-year-old peach orchard for this season, in order that the new wood may have a chance to ripen.

Have you layered those gooseberry bushes yet? The junction of the old and new wood should be buried deep enough to be in the moist soil the balance of the season, with the tip of the new growth above the surface.

There was an excellent crop of very fine cherries with us this year. Even the sweet varieties did better than for many years past.

If you see any of the disease called anthracnose on your raspberry canes, cut

FIG. 161.—BED OF AZALEA AMENA ON MR. WETMORE'S ESTATE, NEWPORT, R. I.

and has been very successful as a hybridizer.

There are few, if any, prettier residences and grounds than Vineland (fig. 162), now the property of H. McKay Twombly, Esq., but better known as the Lorillard home. Alex. Fraser is the gardener now in charge.

Our other views are a showy mass of *Yucca filamentosa*, as seen in the gardens of T. M. Davis, Esq., (gardener Hermann Lipsé), also a view of the residence which is clothed with *Ampelopsis tricuspidata* (Boston Ivy), from which its use as a seaside vine can be estimated. Lastly, in fig. 165, is a representation of the famous flower garden of J. J. Van Allen, Esq., where Arthur Griffin is gardener.

In the foregoing selection, a few typical views have been taken, and there are a host of others of equal merit not included. Among other leading horticultural places may be named those of Mrs. W. Astor (gardener, Hugh Williamson); E. J. Berwind, Esq. (gardener, Bruce But-

markets. But where one has to depend on a constant home-grown supply, it is a first-class pear to have, being one of those unobtrusive little fruits which is not soon dropped, if once used, where quality is the criterion. The tree is a vigorous upright grower, and seldom fails to produce a supply of its greenish-yellow, brownish-red cheeked fruit.

**Peaches.**—Mountain Rose will be in season about the same time. This is a good time to visit some good fruit grower in your neighborhood and ask what he is growing. If you don't find out what you expected, you will learn something else; that is, if you want to do so.

JAMES HOLLOWAY, L. L.

The Pennsylvania peach crop is all right. It is estimated that 100,000 bushels will be shipped from the region between Chambersburg and the Susquehanna River.

them out at once. Better not have more than two or three canes in a hill and have them healthy.

Huckleberries are quite scarce in Michigan this year, except the low bush varieties which grow on the highlands.

To induce sleep, try for supper a good dish of onions fried in butter; that will generally keep a person quiet until morning.

You might as well take some of the premiums at your county and state fairs. Put up your finest fruit in the most attractive shape. A lady near by took fourteen premiums, mostly firsts, principally on canned fruits and baked goods.

We have some of the Schaffer raspberry on low land as an experiment. Their productiveness was a surprise to many. We took care to have furrows to carry off all surface water as soon as heavy rains would come.

Keep layering your strawberry plants during this month just where you want them to set, and as soon as enough are

FIG. 162.—ONE OF NEWPORT'S GARDENS.—VINELAND. (See page 567.)

set keep all runners cut off after that if you want plenty of fruit next year.

On many places there is much waste land which might as well be made use of as to be a harbor for weed seeds to ripen and insects to multiply; this land could be set to raspberries and blackberries, and if inconvenient to cultivate can be heavily mulched with marsh hay or straw and

be made to produce instead of lying idle.

Have you kept the young orchard which was planted to pears, cherries, and apples well cultivated up to this time? If so, it will be better off if let alone the balance of the season.

A good heavy mulch for the currants, if you have it; if not, plenty of manure and good cultivation will do.

The Snyder blackberry; how it is loaded with a fine lot of fruit this season! It seems to be trying to do its best.

Close pruning, plenty of manure and moisture are what bring the blackberries and lots of them, but if the moisture be left out the other agencies will avail nothing.

CHARLES NASH, Mich.

When a rainy day comes, look over the tools to see if they are in the best of trim for work.

What a large heavy growth those Marshall strawberries are making.

We are going to set out a good quantity of the Cuthbert raspberry this month by setting with the spade. As the handle of the spade is pushed forward a couple of gills of water will be poured in with the plant and soil firmed against the roots. The demand for this variety seems to increase here rather than diminish.

We are now planning and mapping out some of our fruit plants for planting next spring. Why do we do this now? For the reason that we can give much attention to preparing the ground and putting the land in the best condition for receiving the plants in the season.

FIG. 163.—YUCCA FILAMENTOSA IN A NEWPORT GARDEN. (See page 567.)

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

## Publishers' Announcements.

Cheques, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESSES.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

**Fertility** SOIL fertility and man's usefulness are, in a great measure, dependent upon the same conditions, alike they are governed by the same law—application. Each will do just what is given it to do. If kept at it, and given the proper attention, the soil will produce enormously, but if allowed to remain idle, it will show to advantage the fruits of idleness, and so with man; give him plenty of work and show by word and act that his work is appreciated, and there is no limit to his industry. The busy man is always the one to call upon for any special, important work; he knows the value of time and how to economize it; every blow he strikes, every word he speaks, carries with it purpose. The result is he builds broad, high, and fast; he seems to have plenty of time for everything, excepting to say "I cannot."

The idle brain is the poor soil of purpose; it never produces anything useful; it never has time. Ask a task of the idler

and he has not the ambition to say no, neither the will to do; his life is a crop of weeds. There is no analogy between this kind of man and the soil; Mother Earth never has a tired feeling, neither does she ever show a spirit of unwillingness; give her an opportunity and she will cover herself with glory. The only thing she does resent is nakedness, she insists upon being clothed beautifully, and she will add the useful to the beautiful.

Nature delights in her productions, the greater the crop the greater her pleasure. There is ever a proud smile on the field that yields 200 bushels of shelled corn, or 400 bushels of potatoes to the acre, while there is a sickly look to the field whose productions are half-starved, or even worse.

The delight of the field is to be so clothed that the sun cannot reach it after the young plants are sufficiently large to absorb its rays. Besides that, nothing impoverishes the earth so quickly as the sun shining upon its naked surface, and drawing from it the moisture that justly belongs to the plant.

Much has been said and written on the improved implements of husbandry; much needs be said in certain lines. Our harvests could not now be gathered in the old-fashioned way; the reaper and mower, the hardened steel plows, and the potato-diggers, have made farming on a large scale possible, and at the same time profitable. On the other hand, the wheel cultivator, or the method of farming that makes its general use possible is very injurious to the farmer. This may seem strange talk and at war with the teachings of the day. If so, look at the results.

Take a run over a farm in England, France, or any other part of the continent of Europe, where hand labor alone is employed, or so far as that goes, look at some of the farms in our own country which are worked in the same way, and see which is the cheaper and the better method.

We have been taught that it is the cheap labor in England that enables the cultivator there to produce seeds and vegetables better than our farmers can do. This is a great mistake, for the labor employed on an acre in England costs more than it does here; it is method and thorough cultivation that gives the advantage.

True, we can harvest a crop more cheaply than it can be harvested by our foreign brother; but, on the other hand, he can produce it for less than it costs us. Contrast the methods of the market gardeners near our great cities with those of the ordinary farmer, and see the results. These small farmers can support a family, and lay aside something annually from the products of a five-acre farm; while the owner of a 100-acre farm is steadily growing poorer.

We have a case in point when speaking thus; there is a farm of 72 acres, worked on the same plan as our five-acre farms, near the cities. It is that of George W. Hallock & Son, Orient, L. I. Here the cultivator is rarely seen, and indeed, not at all outside the potato field. The soil is protected from the burning rays of the sun by the profuse growth of vegetables.

But let us be more explicit. We recently saw growing on this farm a crop consisting of about 20 acres of carrots and onions, the seed of which was sown in al-

ternate rows or drills, the distance between which was seven inches—about one-fourth the distance awarded each, when grown in the ordinary way. Of course, here the cultivation is all done by hand, and, in the most careful manner. The onions, many of which are grown from sets, are ready for the harvest by the first of July, and those from seed by the 15th of the same month. The fields are cleared as speedily as possible, so the carrots, in rows 14 inches apart, have the field all to themselves. This is extreme farming, as the soil is called upon for all it is capable of producing, and its capabilities are shown by an average yield, for the past three years, of 800 bushels of onions and 800 bushels of carrots from each of the 20 acres.

On this farm early potatoes are a specialty, and the harvest commences the first of July, when several, say from three to five, acres are dug, the ground plowed and replanted with corn or carrots daily until the harvest is completed. Here Nature's wishes are respected, the plants absorb all the sun's rays, and there is no loss of moisture from evaporation, the crop gets all the heat and all the moisture essential to its growth; the soil is always moist and soft, allowing the roots to run at freedom, undisturbed by the cultivator teeth, so there is not the least possible check to its growth.

This highly successful system of farming was looked upon by those who trod the "good old path" as supremely ridiculous, for the first year or two, and all of the old school farmers predicted failure, and stood aghast when they saw this new departure called for fertilizers, barnyard and commercial, at the rate of \$100 per acre!

But Nature smiled, while man was sad because of the wicked waste at a brother's hand. The harvest came and 450 bushels of potatoes per acre was the reward for skill and courage combined. No greater compliment can be paid the Messrs. Hallock, than to say that all their neighbors saw a light, and are now guided by it. Extreme farming is intensive cultivation and it is intensive cultivation only that will be profitable to the farmer of the future.

## To Boom American Food Products.

It is proposed by the Agricultural Department at Washington to send representatives to England to lecture on the superiority of American food and meat products. The plan, says the Michigan Tradesman, is to educate the people who are ignorant as to the best method of cooking fruit products, as well as to recommend their consumption.

—This is all nonsense. The English people can cook "fruit products" as well as the average American, and any nation would resent such patronizing as our contemporary suggests is contemplated.

The evergreen idea that the diseases of our fruit trees may be successfully combated by causing poisons or fungicides to enter into circulation within the tree's body is again being ventilated; this time in the Rural New Yorker. Dr. Halsted's emphatic comment fits the case exactly; he says "bosh!"

If the apple growers are alive to their own best interests they will surely profit by the report of the secretary of the National Apple Shippers' Association. Despite the large crop of last year, shipments to English markets were not in excess of the demand there. "The trouble was the poor stuff, poor packing," and so on. Verb. sap!

## Bisulphide of Carbon.

### Its Use in Buildings and on Green-house Plants.

To the Editor of American Gardening.

In answer to I. W. B. Mass., (page 525), I would refer him to my article on page 488. I could not hope to take up too much of your valuable space by naming individually every insect that the fumes would destroy; the item at the end of the original communication plainly stated that all household goods, etc., could be effectually freed from all insect pests.

For a room 12 feet square, put one-quarter of a pint of the liquid into a basin and set it upon the floor of the room, having beforehand securely stopped up all cracks, crevices, chimney openings, key-holes, spaces beneath the door, etc., leaving the sash unfastened so it can be opened from the outside. Put

the more efficient, but is too volatile and does not diffuse with sufficient rapidity. When, however, it is mixed with vaseline, its volatility is reduced, and its diffusibility is increased, the former proving advantageous in light and calcareous soils, the latter in heavy soils.

The vaselined sulphide is applied in the same way as the ordinary sulphide, depositing some at the foot of the vine stock and spreading the rest over the surface; this treatment is found to be effectual, and with it phylloxera is no longer seen in the roots, vegetation is luxuriant, and numerous new rootlets indicate a decisive increase in vitality. The manuring on a test tract of land had not been altered for six years, therefore the improvement was solely due to the bisulphide of carbon. (P. Cazeuueve, U. S. Department of Agriculture. Farmers' Bulletin, No. 19. Bisulphide of Carbon). This is the great French remedy for the phylloxera, 150,000 acres being now

with red spider and aphids. A large box was constructed wherein to place the plants; a stationary glass tube was inserted in a hole in the top of the box, the lower end of this tube being provided with a sponge to retain the liquid which was poured down the tube, and the top was provided with a cork stopper so as to retain the fumes.

Pelargoniums infested with aphids were treated to one-half drachm carbon bisulphide for three hours; this was thoroughly effective and no injury was done to the plants.

Chrysanthemums infested with brown aphids: one drachm for two hours; effectual; no injury to plants, although the shoots were tender.

Cinerarias were treated in the same manner for aphids, and with success in every case.

I myself put several cut worms into the bottom of a five-inch pot, filled it with soil, and put one teaspoonful of carbon

FIG. 164.—RESIDENCE OF T. M. DAVIS, ESQ., NEWPORT, R. I., SHOWING FINE GROWTH OF "BOSTON IVY." (See page 567.)

in the liquid during the morning and let it remain six hours, then open windows, doors, chimney openings, etc., and let all smell of the vapor escape before going in with a light. There should not be any light or fire of any kind in any part of the house, while the bisulphide is being used, nor until after ventilation is complete, or an explosion may take place.

In answer to Mr. George Thomas, Chester Co., Penn., the only safe way "to know more fully of results," is to personally experiment and take notes. For his information, however, I would submit the following:

The introduction of American grape vines to replace those destroyed by parasites in French vineyards has not arrested the use of insecticides for the protection of French vines still attacked by phylloxera; and for this purpose carbon bisulphide (either pure or with water), sulpho-carbonates and submersion continue to be employed with more or less success. The carbon bisulphide is by far

subjected to treatment with it, and it applies equally well to all other root-inhabiting lice. The treatment is made at any season except the period of ripening of the fruit, and consists in making holes about the vines one foot to 16 inches deep, and pouring into each about one-half ounce of bisulphide, and closing the hole with the foot. These injections are made about one and a-half feet apart, and not closer to the vines than one foot. It is better to make a large number of small doses than a few large ones. Hand injectors and injecting plows are employed in France to put the bisulphide into the soil about the vines but for limited tracts a short stick or iron bar may be made to take the place of these injectors.

For root maggot a teaspoonful is poured into a hole at the base of the plant, covering as above.

Professor F. M. Webster, Entomologist of the Wooster, Ohio, Experiment Station, made several experiments in March, 1895, upon greenhouse plants infested

bisulphide upon the surface, turning a tin can over all to keep in the fumes; in five minutes all the worms were dead.

Professor Hilgard, California Experiment Station, could give experience upon grape phylloxera; he was the originator of the use of bisulphide of carbon. I hope I have given such results that "Thomas" will not "doubt," but will experiment.

G. M. STRATTON.

**Saving the Elms.**—The Common Council of Albany, N. Y., has appropriated \$1,000 for the sprayers and solution needed to preserve the elm trees of the city from the ravages of the elm beetle. Albany has set an example, which many smaller cities might imitate to profit and satisfaction.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send us stamp for our new catalogue.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader, are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multiplicity of counsel there is wisdom and safety. Write us often.

**Disinfecting Nursery Stock.**—I have read the various articles in American Gardening with much interest, and especially the one on "Bisulphide of Carbon," on July 10, by G. M. Stratton. Exhaustive as that article seems to be, there is one phase of the subject on which I would like information, viz., what the fumes of bisulphide of carbon destroy the germs of insects? If not, what will? I shall plant an orchard next spring; my stock will come from various sources. My location is in the Rockies away from other orchards, and therefore presumably free from most of the insect pests common to fruit trees. On receipt of fruit trees and other plants, I wish to destroy any insect life such as aphids, leaf roller, etc. How can I best do this, as I think it easier to do this while plants are in bulk than after they are established in orchard?—GEORGE L. HOOPER.

—Certainly prevention is better than cure. Tests with hydrocyanic acid gas for the purpose suggested have given much satisfaction, and on the Pacific Coast it is largely used. So far, in the East, its efficacy has not been put to any severe test except in an experimental way. Professor W. B. Atwood has reported favorably on its use, however. The method of treatment prescribed by him is briefly as follows: A small building about 10 feet square, from 7½ to 10½ feet high, is closely packed with nursery stock. The building is provided with a door 3 feet wide, a partition running through the center, and a trap door at the top for the purpose of ventilation. An earthenware or porcelain fumigating pot is placed inside the door, cyanide of potash is placed in the vessel, water poured over the same and then to this is added the sulphuric acid, which generates the gas by decomposing the cyanide of potash. The door is immediately closed and remains closed for 30 or 40 minutes, after which the trap door is pulled down and the air permitted to go through the room for at least ten minutes before a man may venture into the room.

**Sweet Pea Cupid.**—In your issue of July 17, I saw a note on Sweet Pea Cupid, which I think is misleading. I have it this year for the first time, and find it fully up to the promises given in the catalogues. I had it planted for a border around a large bed, and it has been for the last three months the admiration of the whole town. This Pea should be regarded as a border plant and not for cutting. It is the most showy plant for a border I have seen for some time. I had it in a very rich soil, but deep and loose.—HENRY BEWARDER, Cal.

—This only supports our original views, that the climate is accountable for the vagaries of many plants. This particular one is of no use with us.—ED.

**How is Your Garden?**—At this time of the year, I think the lawns and the flower garden should be in great beauty anywhere; they are then a credit to the gardener who keeps them. The grass should have but one color and that a perfect green; the weeds need to be looked after and destroyed whenever seen; the shrubbery should be well trimmed, the gravel walk kept well raked and clean, and the driveway likewise. If you, reader of American Gardening, have any insect troubling your garden, you have no excuse to make. If you will look through the back numbers and back volumes of American Gardening you will see that every opportunity has been given us how to get away with them.—FRANK A. CARTHON, California.

## Diseases of Shade and Ornamental Trees.\*

BY B. T. GALLOWAY AND ALBERT F. WOODS.

Speaking generally, the diseases of trees may be divided into two classes: (1) Those in which conditions of soil and climate are the controlling factors, and (2) those where parasitic enemies, such as insects and fungi, are the principal agents involved. Some of the more important insects were described in the Yearbook for 1895, and therefore the present remarks will be confined for the most part to the diseases in which conditions of soil and climate and parasitic fungi are involved.

No sharp line can be drawn between the two classes of diseases to which reference has been made. Complications, however, are always involved, and these become more intricate the more they are investigated; in other words, the tree is ready at all times to adapt itself, within certain limits, to surrounding conditions, and in doing this elements of weakness may be developed which will result in disease or death. The adaptability of trees, therefore, to environment is a most important matter in considering the question of diseases, and to properly understand the latter it may be well to briefly review some of the more important points involved in the former.

It is a matter of common observation that different types of soil and climate support different kinds of trees and other plants. It is not always, however, because we find certain kinds of trees growing in certain soils and under certain conditions, that the peculiarities of the soil and surroundings account for their growing there. Such trees may grow very much better under different conditions if an opportunity is offered; otherwise they will continue to grow where they are, at the same time tacitly protesting against their environment.

An important matter for consideration in the question of adaptation of plants is the fact that the individual is much more susceptible to changes than is the species as a whole. For example, an individual White Oak tree in a moist, warm region would make a growth which would quickly dry up if moved to a region where moisture is deficient, but where other White Oaks were growing, whereas if it had been started from the first in the dry region it would have adapted itself to the conditions and thrived there. Conversely, the tree growing in a dry region or place, if moved to a wet location, is liable to suffer, as it is unable to adjust itself to such a sudden change. It is a common practice to transplant trees from the forest to yards and other places where the conditions of soil and air are quite different from those under which the plant originally grew. In such cases it is difficult to get the trees to live, owing to their inability to adjust themselves to the new requirements. If they do not entirely succumb to the effects of changed surroundings, they may, during the period in which they are trying to adjust themselves, be attacked by parasitic enemies, which will simply result in death in another form.

From such facts as here adduced it would appear that disease or death of trees is largely the result of combinations of unfavorable factors, and that where these latter are favorable to the performance of the normal functions of the trees they might continue to live indefinitely. Unlike an annual or biennial plant, a tree renews itself each year by a thin layer, which forms between the old bark and the wood. This layer is the starting point for the next generation, so that we have a great mass of dead and dying generations within, coated outside with a live generation, which is just as distinct individually from previous generations as a new plant produced from a cutting or bud is distinct from the parent, and which, therefore, strictly speaking, is never old.

As long as the conditions for obtaining food and water from the soil and for conducting these to every part of the tree are

favorable and the effects of climate are not detrimental to growth, the living portion of the tree should be as vigorous as ever. These conditions, however, are seldom attained, and as a result the duration of life is long or short according to the ability of the tree to overcome the difficulties in the way of its development. Thus, if there is a continual drain on the supply of soil foods, with no addition, the tree will eventually starve to death or become so weakened that it will succumb to the attacks of parasites; a period of drought may kill many feeding roots, branches, and leaves, and as these decay, openings will be left for parasitic fungi; a period of cloudy, wet weather may do the same by asphyxiating many roots and leaves; a severe cold spell may "kill back" young growth and injure the young leaves in the spring; a late, warm, and moist fall after a dry summer may induce a fall growth which cannot mature sufficiently to withstand winter cold, and is thus "killed back"; insects may defoliate the branches and borers mine the trunk and limbs, and thus cut off the distribution of food and water and make openings for the entrance of parasitic fungi; parasitic fungi may attack some part of the tree under certain favorable conditions without the tree being previously injured; a tender vegetative growth, although perfectly healthy and normal, may at a certain phase of development be unable to resist the attacks of certain parasites, while later the parasite may not be able to gain entrance; the chemical composition of the juices, or the prevalence of sugar, starch, and acids or bases, may make it possible for parasites to attack the tissues during certain stages of growth, and thus produce disease.

## DISEASES DUE TO SOIL CONDITIONS.—LACK OF FOOD AND WATER.

A disease known as "stag head" or "top dry" frequently results from lack of proper food in the soil. The trouble manifests itself by the gradual death of the top of the tree, the lower branches remaining green, but making little active growth. It is common in forests, especially where the conditions have been changed by cutting out or burning the undergrowth, by greatly thinning out the trees, or by excessive draining of moist areas. It often appears in parks where the natural undergrowth has been cut out and the trees have been thinned, thus exposing large areas to the sun and the washing effects of heavy rains. In such cases there is at first, as Hartig points out, an accelerated decomposition of the humus which covers the soil. At the same time the manufacture of sugar and starch by the leaves is increased, owing to an increased supply of light. Stimulated by this increase of food, all the benefited trees make a more vigorous growth, dormant buds developing into leaves and branches, especially in the previously shaded lower parts of the trees. This may continue for a few years, or until the stock of humus and other available food material is reduced. The soil then dries out to a considerable depth during the summer, and as a result many of the upper feeding roots are killed, the natural processes which render plant food available are interfered with, and starvation begins. As the soil becomes poorer and poorer the lower branches appropriate most of the food and water and the upper ones, not being able to obtain their share, die.

Trees planted in parks, in yards, and along streets are especially subject to this disease. Growing year after year where there is no addition to the available soil foods, especially nitrogen, and where the soil is dried out by the sun and grass, starvation necessarily follows. The tree therefore gradually stops growing, the branches and limbs slowly die, and other diseases set in, until finally the last branch is dead. Another cause of this trouble is often found in the process of grading, which removes what good surface soil there is, leaving one not only of poor physical quality, but also lacking in nitrogen, if not in other available soil foods. In planting trees in such places a hole, possibly of sufficient size, is dug, and the tree is set in this, probably with some richer soil, which will furnish food

\*In Yearbook of the U. S. Department of Agriculture 1896.

for an indefinite period, according to its quality and amount. If the quality of the soil is poor and the amount small, the tree will begin to starve in five or six years; if the quality is better, and the amount larger, it will last for a much longer period. But no matter how good the soil may be to start with, unless the food supply is properly renewed it is sure to become exhausted as far as the tree is concerned, and starvation, with all its incidental troubles, will follow.

**Preventive measures.**—It is evident that a constant supply of proper food is necessary to prevent this disease. If the soil is naturally rich, well drained, and of good texture, little need be done in the way of improving it. Wherever practicable, the ground underneath the trees should not be completely sodded, but should be planted to low-growing, shade-enduring plants, so that most of it may be worked and top-dressed each year, thus keeping up the food supply and the proper aeration of the soil. The poorer the soil the greater the precautions that must be taken in this direction. When trees are to be set in very poor soil, as is often the case in cities, a hole at least 8 feet long,

important process of fixing atmospheric nitrogen in soils deficient in air, especially its most important element, oxygen, while other similar organisms may even cause the destruction of what nitrates there are present. This is particularly true of wet soils and those of very close texture. The presence of much water between the soil grains prevents the circulation of air, and there is consequent loss of nitrates, the most valuable of all soil foods. But aside from this important consideration the plant roots themselves require a plentiful supply of oxygen in order to carry on their own life processes. Growth cannot take place without it, neither can the formation of reserve materials. These processes are especially active in roots. A deficiency of oxygen for roots at once becomes apparent by cessation of growth, and, if too long continued, by the death of the roots, followed by starvation and death of the whole plant.

Trees are often injured in poorly drained soils during a wet period. Of course, if the presence of water is constant and the tree has grown up under these conditions, it will produce many surface and water

paved. This trouble is especially liable to occur along streets, where the ground water is only a few feet from the surface. During prolonged rainy weather the water rises, making the soil wet up close to the surface. The pavement adds here to the evil of poor under-drainage, preventing evaporation and aeration.

Another means of cutting off the soil air is by filling and deep planting. It often happens in grading that soil is filled in around trees, sometimes to a depth of several feet. In naturally well-aerated soils the damage that may result from this practice is not so great or so soon apparent. No special harm may result in such soils if the amount added is not more than a foot in depth, but where it exceeds this more or less rapid asphyxiation of the roots, and lower part of the trunk will follow. The tree may not be killed, but it will at least be greatly checked and stunted in growth, making it more subject to other diseases.

The same troubles often result from too deep planting, especially in heavy soils. The deeper roots rot, and the tree makes a slow, stunted growth, and sometimes lasts for many years, when it either

FIG. 165.—RESIDENCE OF JOHN J. VAN ALLEN, ESQ., AND SUNKEN GARDEN AT NEWPORT, R. I. (See page 567.)

2 feet deep, and 8 feet wide should be excavated and good soil substituted for that removed. Along streets and walks as large a parking as possible should be left around the tree. Each year this should be spaded as deep as possible without injuring the roots, and then top-dressed with good rotten manure, enriched by a sprinkling of ground bone. Grass or weeds should not be permitted to grow in this area, nor should the ground be allowed to become trampled down. If these precautions are taken, the health and life of the trees will be extended many years beyond what they would under less favorable conditions.

#### IMPERFECT CIRCULATION OF AIR IN THE SOIL.

The proper aeration of the soil has an important bearing on the health of trees. The amount of air and its circulation are affected by the size and arrangement of the soil grains, amount of water present, proximity of pavements, filling, grading, etc. Whatever may be the cause of imperfect aeration, the effects are far-reaching and important. In the first place, nitrifying organisms cannot carry on the

roots, thus adapting itself to a wet situation. We refer here, however, especially to soils which are too wet only at certain periods—low places, underlaid by hard pan; where, ground water comes close to the surface, or in stiff soils, which, becoming saturated, hold water for a long time. The roots produced in the rather dry or moist soil are injured or killed during wet periods, especially the deeper ones, like the tap-root and the lower laterals. A prolonged wet period followed by a very dry one is liable to completely kill the tree under such conditions. In some of the close-textured soils of the West and Southwest, naturally deficient in aeration, trees often suffer or are killed during the rainy season, or by excessive irrigation. When the roots are not killed, they are so weakened as to be made subject to the attacks of various root-rot fungi.

Trees planted along the paved streets of towns or cities nearly always suffer from a lack of aeration of the soil. The exchange of gases between the soil atmosphere and the air is greatly retarded by pavements and walks and by the hard-packed surface of roads which are not

dies of its own accord, is blown over by the wind, or death is hastened by some parasitic disease. Large numbers of young trees set only a few inches too deep are killed in this way.

**Preventive measures.**—In all cases where there is a lack of aeration steps should be taken to keep the ground around the trees stirred. In cities parking must be left, and where the ground is hard it should be frequently spaded to a depth of 6 to 8 inches, as already described. When the ground has been filled in around the trees, the latter, if not too old, may be saved by removing small patches of bark down to the wood. This should be done at points beneath the soil so as to induce the formation of new roots from the wounds. Some trees, like willows, poplars, beech, and hornbeam, but especially shrubs, produce adventitious roots just beneath the surface of the ground, and these are able to preserve the trees though the deeper roots may be killed.

(To be continued.)

Our publishers will supply any book wanted. Send your orders.

**W. & D's.****Celebrated Sure Crop.**

**MUSHROOM SPAWN. 8 lbs.  
FOR \$1.00.**

Lilium Harriell, Roman Hyacinths, Freesias,  
Paper White Narcissus, Callas,  
Etc., Etc.

Special PRICES on application.

**WEEBER & DON,**

Seed Merchants and Growers.

114 Chambers St., N. Y. CITY.

Mention American Gardening when you write.

**DWYER'S SUMMER and AUTUMN LIST**

Of Pot Grown and Layer STRAWBERRY Plants, CELERY, VEGETABLE Plants, FRUIT Trees and ALL NURSERY STOCK will be mailed free to all who apply for it.

**T. J. DWYER, Cornwall, N.Y.**  
Box 175.

Mention American Gardening when you write.

**Competitors Carry One Point.**

Certain manufacturers who use cheap material put together without provision for the demands on nature (contraction and expansion) are able to pay big commissions. This is the one claim for superiority with which they often try to bribe agents to desert us. They seldom win, as a conscientious man will refuse to handle inferior goods even for greater profit.

**PAGE WOVEN WIRE FENCE CO., Adrian, Mich.**

Mention American Gardening when you write.

**FOR SALE.**

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advertisement, and each initial, or a number, counts as one word. No cuts or display type allowed.

**HULSEBOSCH BROS.,** bulbs and plants, Englewood, N. J.

**GLASS** at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York

**DO YOU WANT** the best flower pots? If so, send address to The Whildin Pottery Co., 718 Wharton St., Philadelphia. Three shipping points, can save you freight.

**SNYDER BLACKBERRY,** Early Ohio Black Raspberry, Cuthbert's and Brandywine Red Raspberry plants, 50c. per 100; 4c. 00 per 1000. Victory and Cherry Currant, and Downing Gooseberry, 1 year, \$1.20 per 100; \$10.00 per 1000. Strawberry plants, \$1.25 per 1000. A. Y. Cathcart, Bristol, Ind.

**Situations Wanted.**

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**WANTED** position as gardener. English, married, age 41, life experience in the culture of stove and greenhouse plants, forcing grapes, mushrooms, etc., and the routine of flower and kitchen garden; excellent references. Apply Florist and Gardener, Post Office, Bridgeport, Conn.

**WANTED**—A position as head gardener or general superintendent on a large country estate, by a Scotchman, who has had 17 years' experience in this country; 15 years in last situation; ability and references cannot be questioned. Only those requiring the services of a first-class man need apply. Address Practical, care of American Gardening.

When ordering goods subscribers will confer a favor on the publishers by stating they saw the advertisement in **AMERICAN GARDENING**. We admit only responsible business houses in our advertising columns. Avoid delay and disappointment by giving name and address legibly.

**PRIVATE GARDENERS.****Appointments and Doings.**

Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.

Mr. W. L. Palmer, late head gardener to Mrs. G. H. Perkins of Rochester, N. Y. has been engaged as head gardener to E. F. Searles, Esq., of Methuen, Mass., who is building an extensive range of glass, and laying out over 2,000 acres of land into park and ornamental grounds.

Mr. Anton A. Voorneveld, formerly superintendent for Ira Parker, Concord, N. H., has started into business for himself. He will raise cucumbers under glass for the Boston market.

**Port Chester, N. Y.**

The newly formed horticultural society is now well launched. At a meeting held on July 24, the previously adopted title of the body was under discussion, and as it was considered that the name of Port Chester was too local and the society will henceforth be known as the "Westchester County Gardeners' Association." It was also decided to hold a fall exhibition on on November 5 and 6 next.

**Floral Park, N. Y.**

A party of 30 gardeners and specialists visited the establishment of John Lewis Childs by invitation, on Wednesday, August 4. The chief point of interest was the 80 acres of Gladioli with the 3,000,000 odd corms. The kinds coming under special observation being the superb hybrids of the Childs section. The coloring and markings of these, together with their great size, make these forms very valuable for garden use. After viewing these and others, the party was entertained at lunch. Mr. Childs had intended to preside, but through indisposition, was unable; however, the interests of the guests were well taken care of by E. S. Miller, the manager. Another wander was made over the balance of the 150 acres, which is under cultivation, and many rare and beautiful subjects among hardy plants were discovered, while among annuals were some fine Zinnias and Star Phlox; another subject of interest was Rudbeckia laciniata "Golden Glow." This charming double form is likely to be of great value to lovers of outdoor flowers and of special service as a cut flower. Mr. Samuel Henshaw of the New York Botanical Gardens, proposed a vote of thanks to Mr. Childs for the great treat he had afforded all present. Mr. William Plumb, superintendent of C. P. Huntington's estate at Throggs Neck, seconded this, and it was heartily carried.

**Cohocton, N. Y.**

The Sweet Pea exhibition on August 5 and 6 was an object lesson of intensive cultivation and considerably in advance of last year's effort.

The center seats of the church, where the display was held, were covered over by boards lined with dark green cloth, so that no harm was done to the pews or woodwork. On this staging was banked Palms, Ferns, Begonias, and a general assortment of blooming plants, each in a jardiniere, and on the outside clear around the whole was a double ledge of Sweet Peas—thousands and thousands of high-grade blooms of all the standard varieties, and including the entire list of novelties, with a competition of 25 entries for a single premium. Altogether it was the closest competition in my experience.

Of the novelties, Prima Donna is certainly the finest light pink Sweet Pea. Aurora, striped salmon to a white ground, is a very distinct, attractive, and noble flower. New Countess is much the best lavender, and Brilliant the best red. Red Riding Hood has such a pleasing shade of color and is so odd in outline, that really it may be classed as a good thing. In a bunch by itself, it shows off to excellent advantage.

Gray Friar continues to gain in popularity, also Mrs. Joseph Chamberlain and Lady Beaconsfield.

Her Majesty still stands pre-eminent. The strong point in favor of the double Sweet Peas is their durability as cut blooms.

Many premiums were offered by leading seedsmen—Peter Henderson & Co., Henry A. Dreer, W. Atlee Burpee, Dingee & Conrad Co., and others.

For social good fellowship and general horticultural interest, commend me to an intelligent rural neighborhood, who are, en masse, lovers of nature and worship at flora's shrine. GROVE P. RAWSON.

**Boston.**

Perennial Phloxes and Antirrhinums were the specialties for which prizes were offered by the Massachusetts Horticultural Society on Saturday, July 31, but the exhibits were far from being up to the standard. M. B. Faxon made a good showing of Sweet Peas, embracing 112 named varieties. Mr. William Thatcher showed a new seedling Delphinium, for which he received honorable mention. J. Warren Clark showed a fine collection of gladioli, the first of the season. M. H. Walsh exhibited four fine specimens of Hydrangea cyanocladia hortensis, full of bloom. William Martin, gardener to S. T. Kidder, Esq., showed Cattleya Harrisoni, and J. E. Rothwell received first-class certificate of merit for Cypripedium Corningii.

**The Society of American Florists.**

The annual convention of this body takes place at Providence, R.I. next week, from Tuesday, 17th to Friday 20th, both included. Many gardeners will attend this gathering, and will have an opportunity of visiting their brothers at Newport, R. I. (Some characteristic views are given elsewhere.) Herewith is a part of the official programme:

**TUESDAY, AUGUST 17, 1897.**

**First Day—Opening Session 10.30 A. M.**  
ADDRESS OF WELCOME, by Mayor Edwin D. McGuinness, of Providence.

**RESPONSE.**

**PRESIDENT GRAHAM'S ADDRESS.**

**REPORTS.**—Secretary, Treasurer, Standing Committees, Special Committees.

**APPOINTMENT OF EXHIBITION JUDGES.**

**MISCELLANEOUS BUSINESS.**

On the afternoon of the first day the Judges will examine and prepare their reports upon the trade exhibition.

An enjoyable programme for the entertainment of the visiting ladies will be arranged for this afternoon by the Ladies' Committee of the Florists and Gardeners' Club of Rhode Island.

**First Day, Evening.**

**PRESIDENT'S RECEPTION.**—Tuesday evening will be devoted to the President's Reception, under the auspices of the Florists and Gardeners' Club of Rhode Island.

**WEDNESDAY, AUGUST 18, 1897.**

**Second Day—Morning Session 10 o'clock.**

**SELECTION OF PLACE OF MEETING FOR 1900.**

**NOMINATION OF OFFICERS.**

**REPORTS OF JUDGES ON EXHIBITS.**

**DISCUSSION OF RECOMMENDATIONS IN PRESIDENT'S ADDRESS.**

**A PAPER**—Subject, "Root Galls of Cultivated Plants," By PROF. B. D. HALSTED, Agricultural Experiment Station, New Brunswick, N. J.

**DISCUSSION.**

**A PAPER**—Subject "Trees and Shrubs such as should be grown by every Florist," By CHAS. J. DAWSON, Bussey Institute, Boston, Mass.

**DISCUSSION.**

**A PAPER**—Subject, "Florists as Scientists versus Artisans," By F. W. BARR, Agricultural College, Durham, N. H.

**DISCUSSION.**

On Wednesday afternoon a Shooting Tournament will take place at Johnston, a suburb of Providence. Intending participants should communicate with the Chairman of local committee on Sports.

Sessions of the American Carnation Society, (2 P. M.), the Chrysanthemum Society of America, the Florists' Protective Association (3 P. M.), Florists' Hall Association of America (4 P. M.), will be held on Wednesday afternoon.

Second Day, Evening Session, 8 o'clock.  
A LECTURE—Subject, "Our Favorite Exotic Plants in their own Homes." With beautiful stereopticon illustrations. By PROF. G. M. L. GOODALE, of the Botanic Garden of Harvard University, Cambridge, Mass.

THURSDAY, AUGUST 19, 1897.

Third Day—Morning Session, 10 o'clock.  
ELECTION OF OFFICERS.  
DISCUSSION—Subject, "A Year's Progress in our Business."

SECTION I.  
The Carnation—Opened by WM. NICHOLSON, Framingham, Mass.  
The Chrysanthemum—  
The Rose—  
On Thursday afternoon the Bowling Contest between teams representing various cities, will take place at the alleys of the Providence Athletic Club. Intending participants should communicate with the Chairman of the local committee on Sports.

Third Day, Evening Session, 8 o'clock.  
DISCUSSION—Subject, "A Year's Progress in our Business."

SECTION II.  
Decorative and Greenhouse Plants—Opened by ROBT CHRISTIE, Newport, R. I.  
Bedding Plants—Opened by J. J. BUTLER, Newport, R. I.  
The Retail Business—Opened by THOS. J. JOHNSON, Providence, R. I.

FRIDAY, AUGUST 20, 1897.

Friday will be devoted to recreation. The Florists and Gardeners' Club of Rhode Island, have chartered a commodious steamer, and will invite the members of the S. A. F., with their ladies, to an excursion down the bay. On invitation of the Florists, Gardeners and Associates' Club of Newport, a landing will be made at Newport where the visitors will be the guests of the local club for the day. An elaborate program including a shore drive is in course of preparation, full details of which will be announced in due time.

The Trade Exhibition.  
This will be a grand exposition of the latest improvements in all requisites for the florists' business; models of greenhouses and apparatus; new and rare plants; garden implements; bulbs; seeds and supplies.

A Special Medal Competition.  
The Society of American Florists offers six silver and six bronze medals to be competed for at Providence, as per the following schedule:

- CANNAS, display of 15 varieties in pots, not to exceed 25 plants in all.
  - TUBEROUS BEGONIAS, 25 plants.
  - CALADIUMS, 12 fancy foliage varieties in pots, one plant of each.
  - AQUATIC PLANTS, display of out blooms, to be kept in good condition throughout the exhibition.
  - HARDY CONIFERS, collection in pots.
- The silver medals to be awarded for the best in each of the above classes, and the bronze medals for the second best. One silver and one bronze medal additional to be left to the discretion of the committee to be awarded to any display of plants, showing advancement in culture or of special value to the trade.

The Dendrobium Orchid Beetle.

A writer in Gardeners' Chronicle calls attention to the destructive habits of this orchid pest. He says that he has proved by experiment that the beetles will and do breed in our orchid houses, a fact which up till now, has been doubted, and, indeed, declared improbable. The name of this beetle is *Diaxes dendrobii*. "It is a pretty brownish-grey beetle, from one-half to five-eighths of an inch long, with long antennae, and with whitish or yellowish lines along its upper surface. The grub, which lies inside the pseudo-bulb, is whitish and legless (but still very active,) with scaly brown head and biting jaws. When full fed it makes a cocoon out of the fibres of the hollowed-out pseudo-bulb, from which cocoon, after pupation, the beetle emerges. "*Diaxes* is injurious, both as imago and as larva. The grubs mine into and tunnel out the pseudo-bulbs, till it may be, merely the outer skin is left, while the beetles feed on pseudo-bulb and leaf and root.

The Fink Apple and Some Other Good Keepers.

Some years ago a Perry County (O.) farmer who had removed to Kansas wrote back to the old home about attending the Franklin County fair at Ottawa, and his surprise (and delight) at seeing on the exhibition table a Fink apple which had taken the first premium at one of the Ohio fairs the fall before and had subsequently been taken to Kansas by a visitor. Fink, when properly managed, is one of the best long keepers and in addition is one of the finest cider apples known, especially for boiling down to make apple butter. The tree is a thrifty and remarkably upright grower, and an early and profuse bearer. The fruit is usually of medium size and a little below, though under favorable conditions it becomes over three inches in diameter. Color whitish yellow with a brownish blush. It was introduced to public notice by the late William I. Clarke, one of the early Ohio nurserymen.

The Fink apple originated, over fifty years ago, in the seedling orchard owned by the family whose name it bears, near the nice old town of Somerset, the ancient county seat of Perry County, O., and the town in which the boy Philip H. Sheridan resided when the late General Thomas Richey—then member of Congress from that district—sent him to West Point Military Academy. On the introduction of the fruit to the Ohio Pomological Society the secretary, Mr. F. R. Elliott, author of the "Western Fruit Book," could hardly be persuaded that it was not Tewksbury Blush. But though there is a similarity in the appearance of the two the latter is not equal to Fink in several respects, and the trees of the two are very distinct.

Fink has often been kept a year and a few times two years, the fruit of three seasons being exhibited together at the pomological meetings in fall and winter. But apples kept so long are not worth much, and there is no need of keeping them so long. Nine months is long enough, until the early apples begin to ripen.

A New Jersey variety, Turn-Off-Lane, is similar to the two foregoing in size, but is striped with bright red. It keeps pretty well. A much better variety is Johnson, an apple from Southern Illinois. The quality is superior and the color is finer—a beautiful shade of deep crimson all over the surface. Tree a vigorous, upright grower and a good bearer. The fruit is larger than the others mentioned and keeps well.

A still larger variety—too large indeed when the tree is not full—is Dr. Stayman's fine seedling of the old Winesap and in quality it has few if any superiors. The color is red, striped, not as bright as some, but a very good color. Tree very vigorous with strong shoots, and a great bearer after it gets fairly under way. This variety—called Stayman's Winesap at first but now Stayman—is coming to the front. Whether it will be equalled by the other seedlings of Winesap now coming into notice, Paragon, Arkansas, Gilbert, etc., can hardly be said yet, and our experience with it thus far has not quite satisfied us that it will keep as long as Stuart's Golden, a differently flavored apple, though both are fine.

Clermont is not much known yet, but it may be said to be a Newtown Pippin with a somewhat warmer color and a much better habit of tree. It originated in Southern Ohio, in the county after which it is named. It is larger than Fink and fully as solid, and it keeps until late in spring.

Gilpin—the old Romanite, or Little Romanite, or Carthouse, with some other synonyms—is a good keeping apple when well grown, but on thin soil it is generally lacking in flavor, becoming a "wooden apple," as the late Dr. Peti-colas, a noted apple grower of Southern Ohio, used to say. It is fine for cider.

For high quality in connection with long keeping few varieties equal Stuart's Golden. It usually lasts until the middle or end of April with only ordinary care; longer when special pains are taken, and it is one of the finest dessert apples. Size medium and above, roundish-oblate; color yellow with a blush frequently. Tree vigorous, spreading, very productive. Origin Fairfield County, O.

Salome, which is doing so well in Northern Illinois, and Onstine Greening and Whinery's Late Red, both from Northern Ohio, where they are well spoken of, will of course all ripen too early when grown south of 40 degrees.

The fine new Tennessee variety, Jones' Seedling, the name of which has recently been changed to the more convenient one of Allison, is well worthy of attention. The tree is a thrifty, upright grower and the fruit is large and beautiful; and being a winter apple in Williamson County (latitude about 36 degrees) it is promising for more Northern localities. As a rule the late fall and winter apples of the Southern States are improved when grown in the North, while the winter apples of the North deteriorate when taken southward.

With the summer apples the rule is reversed. The Southern summer varieties when brought North are of comparatively little value, while the Northern summer apples are usually improved by being grown under more Southern skies.—National Stockman and Farmer.

How's This!

We offer One Hundred Dollars Reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

## AGENTS WANTED.

Read this partial description of the best book of the kind for women which has ever been published, then write us for terms and territory.

## HOUSE PLANTS AND HOW TO SUCCEED WITH THEM.

BY  
LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when nothing with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to be far beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"House Plants" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "House Plants" will take its position second only to the much prized and ever handy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fail.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done if my instructions are followed."

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. Those silent monitors, the flowers, are not dumb, but speak to us through the delicacy of their scents, their intricate shapes, complex habits, and the glorious penciling of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Crossing for Broilers.

The ever-present beginner was giving forth his views the other day. He was wiser than most beginners, for he had studied up the theoretical side of the question for many months, in advance of his proposed work. He was but repeating what he had learned, too. He pinned his faith to a cross of Black Minorca and Black Langshan, he said. He was not working for broilers, but for eggs. In the working out of his plan, however, he will strike some snags. When the business has increased so that he wants 300 or 400 young pullets every year, he is bound to have about the same number of cockerels to sell, either as broilers or roasters, and then he will begin to say big, long, bad words about the black pin-feathers. There are two ways out of this. One is to raise white fowls; the other is to pinch the heads of the offending cockerels as soon as they can be distinguished; thus saving their feed, and saving all the pin-feathering, and keeping the bad words for a worthy object. One prominent raiser of White Leghorns for eggs alone thus disposes of all the small cockerels, claiming that it is money in his pocket to do so. If one raise the broilers, White Leghorn or White Wyandotte is the favorite cross.

#### The Water Lily Seedling.

We are told that these can be brought into bloom in four months from sowing, if a good, strong, regular temperature is maintained. This is one of the most difficult things for the window gardener. "To maintain that temperature is just what you can't do," said one to the writer, a short time ago. "I was over to Dreer's the other day to see the man who has charge of aquatics. He had a strong heat right under his seedling tanks to keep the water warm. I reckon we have to do that, too, if we expect much success. I buy mine now; and that's what you will come to. Your little fellows will not blossom this year, nor next year either."

#### Seedling Cyclamen.

Probably there is not another among the very desirable greenhouse plants easier to start from seed than Cyclamen. The greater difficulty lies in keeping the slow-growing things thriving through the long period between seed-sowing and blossoming. The fine strains of *C. giganteum* are far in advance of the older sorts, and if one wants a new sensation, the double sort may be tried. Late summer and early autumn are good times to sow. The best growers differ as to the period of time required before attaining bloom. Some assert that it may be had in less than a year. Most growers, however, speak for 14 or 15 months. Good drainage is a necessity at all times. One must beware of heating manures, and strong, hot sunshine for the Cyclamen.

#### Lilium Candidum from the Garden.

When even the dimes are so scarce that one cannot buy lily bulbs to force, good healthy bulbs from the garden may be potted, much to the grower's satisfaction. As *L. candidum* makes its growth in the early fall, it should be lifted at once, before this begins. It is well to hold the bulb firmly together when putting it into the pot, and to settle the earth firmly about it. When potted, it may be sunk in the soil where it was growing, and left to nature's kind offices, unless the soil in the pot should become very dry. In this case, it may need an occasional watering. Late in November the pot may be lifted and transferred to a cool room for a short time, after which it may be brought into the heat in a sunny window.

#### A Novice's Idea as to Potting.

A novice tells in a contemporary floral publication of potting an 8-inch plant in a 10-inch pot. About the end of the season the plant was three feet high, and was then transferred to a washtub.

The success with the plant is reported to be phenomenal. It might certainly be considered so, from the fact that there was any success at all with a plant so over-potted. Eight-inch plants, as a rule, require the small pot, while the three-foot plant might be considered as just about ready, perhaps, for the 10-inch pot. It is not a hard and fast rule, inasmuch as plants vary in their habits of growth.

#### Starting Freesias.

Still groaning with the summer heat, as we are, it seems foolishly early to begin to talk of potting stuff for winter bloom. Yet this week—the first in August—the Freesias go into the soil. It is by no means necessary that in all cases they be potted so early. Any time in August or September will do very well. But the Freesia takes longer to mature in bloom than most bulbs, and as it is one of the few that do not have to be put away in the dark, it is as well to pot it as early as it can be procured. We shall put about six bulbs in a 5-inch pot, using leaf mould and rich compost as main constituents of the potting soil with about one-fifth sand, and a small teaspoonful of bone flour to each pot. This mixture we have found to succeed very well. It is absolutely necessary that the soil for Freesias be not of the sort to hold water overmuch; they like plenty of water, but will not bear a sodden soil. The leaf mould used is not the very dry, fibrous kind, filled with roots; but well rotted, fine-grained, and somewhat moist. No water is to be given after the first good soaking, until growth starts, unless the pots dry out very unduly. A moist, cool place will therefore be best until the plants appear, when they will require plenty of air, and plenty of not too hot sunshine.

#### Improvement in Flowers.

As we drift along from year to year, paying little attention to what's being done in the floral world, we may be ready to believe with those of foggy tendencies, that novelties are a fraud, and progress a myth. One cause for this lies in the fact that the majority of people are not willing to give credit for a small advance. They insist that progress shall be by jumps, and while it sometimes comes in this way, it is not the general law that it should do so. It is a fact, also, that the majority of people are not familiar with such progress as is being made. They don't keep posted. Herein lies the great value of the flower show. It helps to bring up to date the ideas of those who would not otherwise know themselves to be behind the times, and keeps them from the foolishness of deriding that of which they have no knowledge. The improvement in flowers all along the line, wherever the raisers take hold of them, is found to be marvellous, whenever we can get a sort of bird's eye view.

#### Repotting in August.

Whether the grower intends to rest her plants or not, if outside they are pretty sure to get more or less of a rest during the droughts of late summer, as it is almost impossible to water them enough to keep them in good growing condition. During this enforced or accidental rest, many plants may be repotted to very good advantage, and set aside where it is cooler for a time. They will then be ready to grow with vigor as the cool and moist days of autumn come on.

#### Standard Weight of Popular Fowls.

This is something that a great many people, who cannot afford to buy The Standard of Excellence, would like to know. Taking the lightest, the pullet, first with pullet, hen, cockerel, and cock in their order, the standard weights run as follows: Black Langshans 6, 7, 8, and 10 pounds; Light Brahmas 8, 9½, 10, and 12; Barred Plymouth Rocks 6½, 7½, 8, and 9½; White and Silver Laced Wyandottes 5½, 6½, 7½, and 8½. The weights of Pekin ducks are 6, 7, and 8 pounds; of bronze turkeys, pullet 15 pounds, hen 20 pounds, cockerel 24 pounds, yearling cock 32 pounds, adult cock 35 pounds.

Roses Under Glass.

Our earliest planted houses will now need staking and tying. In my opinion, it is very unwise to neglect this operation until the plants become so thick that they lay over each other, or portions get so heavy that syringing whips them down on to the soil. When this happens, syringing for spider cannot be properly done, and varieties that are subject to black spot will soon get affected with it. There are different ways employed for staking; some use wooden sticks which are not only unsightly, but they obscure considerable light; others run a high and low wire lengthwise over the plants, the high one being about 3 1/2 feet from the lower one. A string is then run from top to bottom at each plant for support. This is very economical, but after the strings have been wetted a few times, they sag badly, and a good solid job can't be had. The most approved style of staking is to use a wire rod to each plant, tied at the top to a wire running lengthwise. The rods are 3 1/4 feet long. We used to use No. 6 wire for them, but find No. 9 to be just as good. All our roses are thus staked with the exception of American Beauty. On account of its tall habit and not making brush, we find it best to run wires lengthwise immediately over the plants, the first being one foot from the soil, and the balance the same distance apart until the roof is reached. The stems can then be kept

much straighter, being not so easily switched about during syringing. Tying should be done by careful and painstaking workmen; there is nothing to be gained by speed at this work. At the same time a good workman can often get over more plants in a day than a poor one. There is nothing makes a grower more impatient than to have men tying his Roses improperly, by passing a piece of string around the whole plant and bunching the whole together so closely that neither light nor air can reach or circulate freely through the plant.

The varieties that make more blind wood and are dwarfier growers are the hardest to tie up, and one often feels like cutting it out, but this should not be done on any account; at least, that is my experience.

During past years very many growers used to lightly top dress the bed with manure about this time, as it prevented the soil from drying out too quickly and encouraged root action; but lately the practice has been very largely discontinued. I have not used a top dressing until spring for years, only as experiment, and have come to the conclusion it is best left alone. As far as the manurial effects of a light top dressing are concerned, I have never seen any very material difference between those so treated and those not. When our plants begin to need nourishment they are given it in the shape of manure water. H. H.

WHOLESALE MARKETS.

New York.

Stock of most kinds has been considerably lighter in supply for some days past but appearances at time of going to press show evidence of an increased receipt. The market clears satisfactorily on good quality stock at fair figures.

Peaches are good property and sell well with \$3 as fancy price, and \$2.75 as prevailing top figure. New York state peaches are supplementing the New Jersey shipments, and both are selling well, but present prices are not expected to prevail for long, as the crop is heavy.

Californian pears are fine in quality and commanding high prices; so far the local shipments are poor in color and appearance, most of the fruit being scabby or rusted. Good clean bright Bartlett's sell readily for \$3 per barrel.

Some very fine Botan plums are seen from near-by Jersey shippers, packed in quart baskets, 18 fruit to a basket, and 32 baskets to the carrier; these sell for 6c. and 8c. per quart.

Good quality melons have improved in demand and price, but inferior quality is a drag.

Californian nectarines injure the sale of forced or hothouse fruits from nearby shippers, but they are deficient in flavor.

A few hothouse grapes of choice quality realize 75c. per pound, but the larger part of the stock coming commands only 50c. per pound.

Michigan celery is a drag, and is being offered at 75c. per box of 36 heads.

Tomatoes still continue to be poor, and prices consequently low.

Apples—Duchess of Oldenburg, hand-picked, double-head barrel, \$2@2.25; Gravenstein, hand-picked per double-head barrel, \$1.75@2; Nyack Pippin, hand-picked, per double-head barrel, \$1.75@2.25; Orange Pippin, hand-picked, per double-head barrel, \$1.50; Bough, hand-picked, per double-head barrel, \$1.25@1.75; Astrachan, hand-picked, per double-head barrel, \$1.50@2; open heads, per barrel, \$1.50.

Peaches—Southwestern, per carrier, \$2.50@2.75; Georgia and South Carolina, fancy, per carrier, \$2.25@2.50; Virginia and North Carolina, poor to choice, per carrier, \$1@2; Maryland and Delaware, per carrier, \$1@2; Maryland and Delaware, extra, per basket, \$1@1.25; prime, per basket, 80@90c.; common to fair, per basket, 60@70c.; Jersey, extra, per basket, 80c.@\$1; common to prime, per basket, 40@75c.

Pears—Bartlett, Maryland and Delaware, per crate, \$1@1.25; Jersey, per barrel, \$2.50@3.50; up-river, per barrel, \$2@3; Clapp's, up-river, per barrel, \$2.25@2.75; per keg \$1.12@1.37; Bell, near-by, fair to prime, per barrel, \$1.50@1.75; common kinds, per barrel, \$1.25@1.50; Kieffer, southern, per barrel, \$1.50@2.75; Le Conte, southern, poor to fancy, per barrel, \$1.50@4.

Grapes—Delaware, North Carolina, fancy, per 24-pound case, \$1.75@2; Niagara, North Carolina, fancy, per 24-pound case, \$1.50@1.75; other white North Carolina, per 24-pound case, 50c.@\$1; Moore's Early, North Carolina, per 24-pound case, 75c.@\$1.25; Champion and Ives, North Carolina, per 24-pound case, 50c.@\$1.

Plums—Damson, per quart, 4@5c.; Wild Goose, per quart, 4@5c.; per 10-pound basket, 20@30c.; Botan, per quart, 5@8c.; per carrier, \$1.25@1.75; per 10-pound basket, 25@35c.

Apricots—New York state, per eight-pound basket, 20@25c.; per five-pound basket, 10@15c.

Currants—Large, red per quart, 4@6c.; small, red, per quart, 2@4c.; bulk stock, per pound, 3@5c.

Blackberries—Up-river, per quart, 5@6c.; Jersey, fancy, large, per quart, 8@10c.; poor to fair, per quart, 4@7c.

Raspberries—Up-river, red, per pint 6@8c.

Watermelons—Watermelons, extra, per 100, \$12@15c.; small to medium, 100, \$5@10c.

Muskmelons—South Jersey, Gem and (Continued on next page.)

To Secretaries of Clubs and Exhibitions.

We can furnish these gentlemen with all the printed forms and books necessary to the orderly and systematic care of the multitudinous details connected with all exhibitions. Our system once tried will always be used, and can truthfully be called the greatest labor saver ever placed before the public. We can furnish a complete outfit for a large show for \$15.00; for a small show for \$7.50. The supplies include Entry Forms, Exhibitor's Books, Class Books, Judge's Books, Entry Cards and Pastors. Send for descriptive circulars, and, above all, don't allow your next show to pass off without giving our system a trial.

Schedules for Flower Shows

And Exhibitions generally. This is a strong point with us, and we pride ourselves on the rapidity with which we can issue any size schedule, from 4 pages to 400 pages, and always deliver at the time promised.

Tomatoes—Monmouth County, Acme, per box, 40 @ 60c.; Monmouth County, ordinary, per box, 25 @ 40c.; south Jersey, Acme, per box, 40 @ 50c.; south Jersey, ordinary box, 25 @ 30c.; Baltimore, per basket, 80c.

### Boston.

General stock of watermelons is selling at 12½ @ 14c., with some fancy bringing as high as 16c. Cantaloupes not quite as plenty as before, and arrivals are in better condition, therefore demand is better; selling \$1.25 @ 1.50 a barrel or barrel crate. No change in Montreal hothouse melons from last week's prices.

Green corn 20 @ 30c. a dozen; Crosby corn in very good demand.

Grapes, North Carolina, Delaware No. 1 stock selling at \$1.25 @ 1.50 for 24-pound carrier; Niagara \$1 @ 1.25; Concord \$1 @ 1.25; hothouse Hamburg grapes, 25 @ 40c. a pound. Demand a little better than last week.

Green peppers slow, at no particular price, anywhere from \$1 @ 2 a carrier.

Georgia Elberta peaches selling at \$3 early in the week; stock not very fancy; Montrose \$3 @ 4, very good; Californias about \$1.50.

Most of the blueberries arriving are not very good; anything really fancy brings 8 @ 10c., whether New Hampshire or Jersey stock.

Mushrooms worth 75c. @ \$1 a pound, but not a great many good ones are to be found.

Native celery worth \$2 a dozen bunches.

Radishes 10 @ 20c. a dozen, hard to find customers; beets continue plenty and dull at 25c. a bushel; turnips are doing little better; white flats are selling 50 @ 75c. a bushel; rutabagas selling \$1.25 a barrel; fancy stock \$1.50, demand light.

Summer squash same as last week, 2 @ 8c. each; marrow, good demand, \$2.25 a barrel.

Peas from Portland in good demand, \$3.50 a barrel; home-grown stock \$1 a bushel; string beans same as last week, some small picking stock \$1.50 a bushel; very few good stock in market; ready sale, however, for shell beans at \$1.50 a bushel. No limas on the market as yet.

Potato market is very firm; everybody still thinks there will be a good

firm demand during the next four weeks best stock quoted at \$3. Virginia yellow sweets selling \$3.25 @ 3.50; fancy stock would bring little more.

Cucumbers are a little weaker than they were last week, selling 2 @ 2½c. each for good stock.

Not much demand for egg plant.

Cauliflowers are becoming poor; therefore not wanted. Cabbage 2½ @ 3c. each by the hundred.

Illinois tomatoes in fair demand at 50 @ 60c. a crate; hothouse stock 10 @ 15c. a pound; home-grown stock \$2 @ 2.50 a bushel; very fancy stock \$3.

Parsnips, new stock, selling 75c. @ 1 dozen bunches for a limited quantity; carrots 8 @ 5c. a bunch.

Nearly onions are weaker at about 85c. a bushel.

There is a fairly good supply of apples in this market; Astrachans selling \$2.50 @ 2.75 a barrel; bushels, if very fancy, \$1.25; some Massachusetts Williams \$1.50 a bushel; if fancy in barrels, \$1.50; Nyack Pippin \$2 @ 2.50 a barrel; Sweet Boughs are in good demand, \$2 @ 3.

This market is getting a few new apples that are very large, and meet good demand at 40 @ 60c. each.

Paraleys 50c. a bushel; mint 35c. a dozen bunches; garlic continues strong, 6 @ 10c. a bunch.

No currants on the market; blackberries 5 @ 8c. a quart.

Arrivals of pears are mostly in poor order; some Bartlett's selling \$1 @ 1.50 a crate.

Wild Goose plums are sold at almost any price a customer will offer, generally 4 @ 6c. a quart.

### Philadelphia.

Business has been much quieter here during the past week; the berry crop is now well over, and peaches are coming in regularly, consequently a lull has taken place; many dealers are now away looking up the peach crop, and from pre-

TO BE PUBLISHED AUGUST 20.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

This work will contain nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo. Price, \$1.50.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present increasing popularity of the Water Garden is largely due, is intended to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The work should find a place in every library and in the home of all gentlemen interested in gardening; it will prove indispensable to the private gardener, whether he is at present cultivating an aquatic garden or with a view of preparing himself to take charge of one at any moment. It is scarcely necessary to dwell on the value of the book to the commercial man; every one in trade will require it.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A full descriptive list of Nymphæas and all other water plants, as well as of all trees, shrubs, etc., adapted for marginal effects, is included.

— ORDERS RECEIVED NOW. —

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

ent indications, the principal crop appears to be in the Blue Mountain region of upper Maryland. Good reports are to hand from Chambersburg and Hagerstown; all reports from Delaware indicate about 25 per cent. of a crop. About 500 baskets so far have been received from Maryland, and these sold from 80c. to \$1.25.

Tomatoes are still in poor condition and very watery.

Watermelons are selling well, quality not quite up to last week.

Muskmelons are plentiful, but sell slowly at low figures; A No. 1 stock is scarce. Grapes so far are very scarce.

Apricots—New York state five-pound basket, 12@16c.

Pears—Bartlett, Jersey per five-eighths basket, 60@75c.; Le Conte, Southern, fair to good, per barrel, \$1.50@2.25.

Plums—Table varieties, per eight-pound basket, 20@85c.

Huckleberries—Pennsylvania, 6@8c. per quart; Jersey, per quart, 5@7c.

Melons—Watermelons, North Carolina, per 100, \$15@20; fair to good, \$8@10.

Muskmelon, Jersey, per barrel, \$1.25@1.50.

Celery—Fair to good, per dozen, 25@40c.

Corn—Jersey, good, per 100, \$1.25@1.50; fair, 75c.@1; Pennsylvania, per 100, \$1.80@1.60.

Cabbages—Jersey, per 100, \$1.50@2.75.

Cucumbers—Jersey, per barrel, 75c.@1; per five-eighths basket, 30@50c.

Egg plants—Jersey, per barrel, \$1.80@1.80; per basket, 60@75c.

Lima beans—Maryland, per one-half barrel basket, \$1.80@2.40; Jersey, per basket, 60@75c.

Onions—Maryland, white, one-half barrel basket, 75c.@1.25; Jersey, five-eighths basket, 50@80c.

Peppers—South Jersey, per box, 60@80c.

Squash—White, per barrel, 60@75c.

Tomatoes—Jersey, fancy, per basket, 40@50c.; fair to good, 10@30c.

Turnips—Yellow, Jersey, per barrel, 75c.@1.25.

Potatoes—Remain firm as a scarcity is looked for from nearby growers; prices rule from \$2.25 to \$3 per barrel.

## Chrysanthemums.

**General Routine.**—Watering, tying, staking, and so on, now occupy the time. Remember the old, old advice, never to let your plants get dry, and to build up the growth as it is made. Keep plants as short jointed as possible, and the growing tips free from fly. It may not look as though the fly was hurting much, but it is helping to cripple the plant just the same.

**Bench Plants.**—If these have been mulched with tobacco stems, fly is not in evidence, and the plants are making clean healthy growth. The main thing to watch is not to let the bottom of the bed get dry; if it does, the young points, instead of growing out freely will begin to make a short stunted growth which will often throw a blind bud. The syringing may leave the top of the bed moist enough while the bottom may be quite dry. When the bed is watered, make sure it is saturated right through.

**Bonnaillon** with its pale green tip gives the impression of growing too rapidly while as a matter of fact it is one of the slowest of growers. If the old leaves are of a rich dark color and all curled up, the plant is healthy enough. It is deservedly a great favorite and one of the most useful, coming good from any bud and invariably of fine form.

**F. L. Atkins** is the worst variety I know of for throwing suckers, and needs constant watching. If they are not cleaned out, they make a perfect network and rob the bud to a very great extent. This variety is a very fine keeper.

C. TOTTY, N. J.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

## HENS AND EGGS

fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25.**

**POULTRY MONTHLY** is now in its nineteenth year; it has always been recognised as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend **Poultry Monthly** as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

### A WONDERFUL OFFER!

**American Gardening** (Weekly), \$1.00 } Both \$1.25  
**Poultry Monthly**, " " 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.

Address **AMERICAN GARDENING, P. O. Box 1697, New York City.**

## Park and Cemetery.

An illustrated monthly for the advancement of Art out of doors. Practical articles of permanent value by competent authorities on subjects of special interest to **Commissioners, Trustees and Superintendents of Parks and Cemeteries**, and those interested in **Tree Planting and Town and Village Improvements**. Plans of Parks or Cemeteries, and their architectural and landscape features, illustrated every month. Subscription \$1.00 a year. **R. J. HAIGHT, Publisher, 334 Dearborn Street, Chicago.**

FIG. 166.—A BED OF RHODODENDRONS.

The above is a reproduction from a photograph, and shows how beautiful the Rhododendron is when massed. The view is taken on the estate of Ed. Whitin, Esq., Whitinsville, Mass., where P. B. Robb is in charge.

## Pickling Cucumbers as a Winter Crop.

Forcing vegetables under glass in winter has been abundantly proved to be profitable. On account of the great competition in producing pickling cucumbers in summer, and because they are not generally grown in winter, I believe good profits are open to those who will successfully produce them under glass. The prices realized in winter will be larger than in summer, and the production in a 40-foot greenhouse will, with proper cultivation, exceed that of a quarter acre cultivated in summer. The gherkin is more productive than the English cucumber, and the exhaustion of the vines is less because the crop is gathered when the fruit is quite small.

A narrow commercial greenhouse with benches on each side and an even span roof is the proper structure for the purpose. The benches should be 10 inches in depth and 3 or 4 feet wide; here one line of plants, two feet apart is sufficient, and light wire strung across the house from the gutter beam to the ridge, and down again to the opposite gutter beam will serve as a frame for the vines. The wires 12 inches apart should be 12 inches from the glass at each side, and 18 inches in the center.

### Soil.

The proper soil is a rich sandy loam from an old pasture, one part to three of well-rotted manure, and one part to twelve of crushed bones, one-quarter-inch size, all to be well mixed together. On the bottom of the benches place three inches of well-rotted manure, pounded down firmly, and on this manure make hills two feet apart and even with the top of benches, using the prepared soil and also covering the manure to about one inch with the same. The house will then be ready to receive the plants.

### Seed Sowing.

For early winter use seed is to be sown early in September. The plants may be raised either in a covered frame, or in the house where they are to be grown. For starting the plants have some finely-sifted soil, sowing the seeds in 8-inch pots, first placing in the bottom of each pot a little well-rotted manure. Fill the pots one-third up with the prepared soil, sow three seeds in each pot, cover with soil, and plunge to the rim in a covered frame or in a sheltered part of the greenhouse leaving them there until the seedlings are ready for repotting, and giving no water until all the seeds are above ground.

As soon as the seedlings show the rough (true) leaves, they are ready for repotting. Each plant should now be repotted singly in a 8-inch pot in the same way as when sowing the seed, plunging each pot to the rim to remain thus for two weeks when it will be ready for planting in the permanent quarters. After repotting, the plants should be watered with a fine sprinkler once every day until established.

### Planting.

In planting in the hills, I do not take the plants out of the pots, but with a trowel open the hills clear down to the bench, placing the pot on it and closing the soil in around the stem of each plant up to the seed leaf. In ten days after planting, the roots will show through the hills, and it is time to fill in the space around the hills to the top of the bench with the prepared soil, making all firm and even around each plant. Light stakes may now be placed to each hill having them long enough to reach the wires above where they are tied loosely.

As the vines grow, all blossoms and any small fruits that may show on the vines until they reach the wires should be taken off in order to make the vines vigorous when they reach the roof, where the main crop of gherkins will be produced.

### Pinching.

When the vines have reached the wires, the top of each must be pinched out, which will cause them to send out side shoots. Train three of those shoots for each vine to the wires on the roof, and as

soon as they grow half way up the wires, pinch their tops out, and induce the putting out of numerous side shoots which should be trained to the wires crosswise, and each pinched out at the fourth joint or leaf. As soon as the vines reach the middle of the roof, the tops should be pinched out and all side shoots tied to wires and pinched at the fourth leaf. This pinching the tops of the vines makes pickling cucumbers very prolific either under glass or outside. At this stage there is an abundance of vines and fruit which will continue in yield until the end of May.

### Aphis, Mildew, etc.

Black aphis is one of the worst enemies of cucumbers under glass; but I have found no trouble in keeping this pest down by the use of fine tobacco dust. It first attacks the plants on the underside of the seed leaf, and if not looked for there in the beginning, will give a great deal of trouble later on. Before planting I take each plant separately, carefully examining every leaf, and with a soft brush remove all aphis in sight, then lightly dusting every leaf on the underside and the growing point with tobacco powder. I never use the tobacco powder when the vines are wet.

Mildew is very destructive, but is seldom, if ever, found in a well-ventilated greenhouse; it makes its appearance in small white spots on the leaves. Three parts of finely powdered sulphur and one part of powdered charcoal mixed together and applied with a camel's-hair brush to the spots as they appear, will eradicate this disease if the atmosphere be kept buoyant.

Red spider and thrips are very destructive if they once get possession; they thrive in a dry, hot atmosphere, so syringing the foliage when weather permits, and in fine bright weather moistening the benches and floors three or four times daily, are good preventives. A syringing once a week with a solution of common yellow soap water is also good.

No operation connected with raising cucumbers under glass in winter demands more attention than the distributing the pollen; the fertilization must be done artificially. With a small camel's-hair brush collect some pollen and introduce it into the female flower.

### Temperature.

In starting gherkins early in September, the temperature should be as low as the season permits. The object in view is to have the young plants stocky and vigorous. By the time they have reached the wires on the roof, the temperature should be 60 degrees at night, 70 degrees at day, and when the vines have reached halfway up the wires, the temperature is raised to 65 degrees at night, with 75 degrees by day. Liquid manure diluted to one-half with water, and all kinds of phosphates used two ounces to the gallon of water, may be given in watering several times weekly. This treatment will add to productiveness of the vines and prolong the time of bearing.

### Varieties.

As to varieties, there are several and any one of the following may be forced successfully: Cluster Gherkin (immense bearer), Prolific Pickling, Short Prickly, Boston Pickling, Green Prolific, Small Gherkin, Thorburn's Everbearing, and Early Russian. WILLIAM THOMPSON.

Reports from the peach districts, about Whitehouse and Flemington, N. J., are to the effect that the trees are laden with fruit, but it is not of a superior character. The peaches are small. There was a great demand for early fruit, and fifteen carloads were shipped from Whitehouse at an average price to the shippers of from 40 to 45 cents a basket. The heavy rains and low temperature have stopped the fruit from maturing.

This year's yield of peaches in 25 of the best fruit counties in southwest Missouri is figured at a trifle over 1,200,000 bushels, and of apples about the same, and the aggregate value in cash, it is thought, will reach \$4,285,000. In addition to this, it is believed the same territory will produce at least \$100,000 worth of grapes and wine.

## The Fruit Garden.

**Grape Vines** should have the rank growth stopped again, after which but little further attention will be required in the way of pruning. As a general thing, too much wood is cut away with the idea that the sun is a necessity; but it will not stop the bunches from ripening if the sun does not reach them. Nothing need be said on that point to those who practice bagging. To have sweet berries, there must be a fair amount of leaf growth until the fruit is ripe, and the best way to have that is to encourage a steady growth after the first stopping, which with the corresponding root action, will keep the original, oldest (hard and leathery) leaves in good condition. Stop all growth in the early summer and you stop the root action; you may as well expect to keep an energetic man healthy by making him take three square meals a day and forbidding him to move for the rest of the time. Get roots and the rest will follow.

Mildew comes very suddenly. Now is about the last chance to apply Bordeaux for it, that is, if the fruit is not bagged; to spray them after the bunches begin to color will spoil their appearance.

Niagara with me is prone to mildew, more so than any other variety I have.

**Strawberries.**—Keep the soil stirred about the plants; weeds are plentiful now, and will be more difficult to kill as the days get colder. If you can't stop them all with the rake, begin on the smallest first.

**Apples.**—A good all-around everybody's apple is the Summer Pippin, or Nyack Pippin. It is of a tawny color, pale waxen yellow, shaded when ripe with a delicate bit of crimson and sprinkled with grayish dots. Fruit about three and a half inches in diameter. Splendid for cooking, when quite small, and when ripe is not too acid for many people to eat out of hand. It won't take as a dessert apple, but it will hang so long on the tree to get the most woolly flesh of any apple I know. The tree is a vigorous grower, with a decidedly pendulous habit when aged, very distinct from the average run of apple trees.

For Table we use Jersey Sweet and Devonshire Quarrenden apples, Bartlett pears, Washington and Purple Favorite plums, with Mountain Rose peaches. Ribston Pippin apple does finely here, but is at its best in early September, whereas in England it is in fine condition in March. JAMES HOLLOWAY, N. Y.

### Legislation Against Disease.

Pennsylvania has adopted a stringent law as regards diseased fruit trees. It went into force on June 18 last and declares: That it shall be unlawful for any person to keep any tree infected with the contagious diseases known as yellows, black knot, peach rosette or pear blight, or to offer for sale or shipment, or to sell or to ship any of the fruit thereof, except the fruit of the plum, cherry, and pear trees; that both tree and fruit so infected shall be subject to destruction as public nuisances. More than this, no damages shall be awarded in any court in the state for entering upon the premises and destroying such diseased trees or parts of trees, or fruit, if done according to the conditions of the law. "It shall be the duty of every person," says the act, "as soon as he becomes aware of the existence of such disease in any tree or fruit owned by him to forthwith destroy or cause said trees or fruit to be destroyed." It further gives authority to the township to carry out its provisions.

A new association has been formed in Westchester, Pa., having for its object the awakening of an interest in the cultivation of flowers, shrubbery, etc., for the adornment of home grounds. It gave recently a free exhibition of plants and flowers on the spacious grounds of Samuel Wagner, Esq., at Greene Hill. The object in view is wholly educative in character and no charge of any kind is made either for entering exhibits or admission.

## More Asparagus Rust.

### A Second Outbreak of the Disease.

We have been requested to insert the following information concerning the asparagus rust which is reported as very bad this year in New Jersey. It made its appearance as early as the middle of May upon volunteer plants along roadsides, or in fields which had been previously in asparagus. As this is a new and somewhat alarming enemy to the truck-growers of the state, the following items are published:

**General appearance of the field.**—When an asparagus field is badly infested with the rust, the general appearance is that of an unseasonable maturing of the plants. Instead of the usual healthy green color, the field has a brownish hue, as if insects had sapped the plants or frost had destroyed their vitality.

**Close View of the Plants.**—Rusted asparagus plants, when viewed closely, are found to have the skin of the stems, both large and small, lifted as if blistered, and in the ruptures of the epidermis dark brown spots are readily seen, as shown in the accompanying figure. These brown dots or lines are of various sizes and shapes, and remind the close ob-

FIG. 168.—PORTIONS OF RUSTED ASPARAGUS STEMS.

server of similar spots in the broken skin of stems of grains and grasses and of the leaves of corn, also due to rusts, but not the same kind as that of the asparagus.

**Nature of the Rust.**—The asparagus rust is due to a fungus (*Puccinia asparagi* D.C.), that is, a minute plant consisting of microscopic threads which grow through the substance of the asparagus plant, taking up the nourishment that is needed, and finally break through the surface to bear the innumerable brown spores that give the dark color to the spots on the asparagus stems. This is the last stage in the development of the rust fungus, and as such remains over the winter. When the warm, moist weather of spring and summer comes, the spores above mentioned germinate, and a new lot of asparagus plants may become infested.

**Treatment of Infested Fields.**—There are two general methods of checking the rust, namely, by destroying the spores and by preventing their growing upon, and getting a foothold in, the substance of healthy asparagus plants. The rust fungi are among the most difficult to check—by protecting the plants they feed upon—by means of fungicides, Bordeaux mixture, etc., sprayed upon them during the growing season. While something may be hoped for with the spraying

pump, the chief method of eradication lies in the destruction of the many spores. This can be done in a very simple and effective manner by carefully gathering all the parts of the asparagus plants that are above ground and burning them. It would be a waste of time to stack the tops and leave them to natural decay; and to place them in manure heaps would be still worse. The only safe thing to do when a serious enemy like this is in the asparagus field is to burn the plants even to the last scrap that can be gathered up. Let this be done at once, for any delay means the breaking up of the brittle, rusty plants, and a generous sowing of the spores upon the ground. If the fire could go over the whole field and burn all the small as well as the large pieces, that would be the best of all.

This enemy may become very serious if thorough measures are not taken at once, and by all who are engaged in asparagus culture.

BYRON D. HALSTED.

## The Vegetable Garden.

**Blanching Celery.**—To enjoy celery perfectly blanched, care must be exercised in the earthing up, so as not to allow any of the soil to get into the centre or heart of the plant, otherwise it may be spoiled. When this work has to be done by one man, it is a convenient way to first tie the stalks up together, not too tightly, or it may rot, but just close enough without pressure to prevent the entrance of any soil to the heart. In large gardens where several men are kept, the most expeditious way is to have three men do the work, one man on each side of the row or rows to dig up the soil and place it in position against the plants, while the third man straddles the row, and in each hand gathers together the stalks and holds them up till the other men put the soil in position. As the work progresses the soil is to be somewhat compacted with the hands. Three good handy men will do this work very quickly after a little practice. On soils containing many insects, or earth worms, or where celery is liable to rust badly from the iron in many soils coming in contact with the tender stalks, the best and most satisfactory way is to use boards, a foot or so in width, placed on edge on each side of the rows, about six inches apart, according to the size of plants. There is much

difference of opinion among growers as to the best method of blanching celery to best secure that peculiar nutty flavor found in well-blanching celery, many claiming the necessity of earthing up, but we find that celery can be blanched just as well and be just as tender by the use of boards as by the earthing up process; but if boards are used, a longer time should be given to blanch. This method has the advantage of clean, rustless, and wormless stalks. For summer use the self-blanching varieties only should be used.

**Mustard and Cress.**—A little sown weekly from now will come in well for salads.

**Summer Sown Seeds** should be kept clean by the frequent use of the hoe or cultivator, and as soon as large enough the plants must be thinned out. This applies to such crops as turnips, beets, carrots, etc.

W. M. EDWARDS, Conn.

The fertilizer requirements of small fruits are similar to those of orchard fruits, but being, as a rule, more rapid growers, they can utilize to advantage heavier applications of soluble fertilizing materials and do not derive the same benefit as orchard fruits from slowly decomposing manures.

## Chrysanthemums.

**Crown Buds** are now forming, and the grower must determine which bud he is to "take", being influenced by the use to which he intends to put the flowers. For large exhibition flowers the crown bud is the best, but the flower then gets up above the foliage, notably in kinds like Indiana and therefore for general decorative work the terminal bud will throw the best flower, for though smaller, it is better furnished with foliage. For the benefit of the uninitiated, it might be well to state that the crown bud is always known by the three or four growth-shoots which appear directly under it, and these must be at once removed, or they soon render the bud useless by taking away all the strength. It is safe to take the crown bud any time now if a little heat can be given when the flowers are opening. The reason the crown bud comes deformed is very frequently that it is kept too cool. Some growers swear by the crown bud and some swear at it, results being largely a matter of individual practice.

**Disbudding** should be done in the morning, because then the shoots are brittle, and easily rubbed off. Hold the stem in one hand and use the thumb-nail of the other to remove the superfluous buds. Care must be used in the operation, for it is mighty easy to injure the bud and destroy the labor of months.

**It is Not to be supposed** that because the crown bud shows earlier, the flower will open earlier also. It makes but little difference, in fact, sometimes the terminal bud opens first, as the crown hangs for a long time.

**Terminal Bud.**—If the crown bud is not needed, rub it out and select the best of the shoots which appear, which will, in a few weeks produce a terminal bud. This is always safe and must be grown along very cool to allow the wood formed since the last break to ripen. Vivian Morel, on account of the poor color of the crown bud, is always better on the terminal; and in the Chinese such has been my experience with Miss Gladys Spaulding, not for the color but for the perfect shape of the bloom, the crown bud throwing a peculiar looking bloom that might pass for an Anemone-flowered variety.

C. TERRY.

[This matter of the selection of the bud in certain varieties is not much understood by some of our would-be teachers, and we are glad to have it brought before our readers. It has happened sometimes that a variety has been condemned when the fact was the grower did not select the proper bud.—ED.]

## Exhibitions.

**Picton, Ont.**—At the Prince Edward Agricultural Society's Grand Diamond Jubilee Exhibition to be held September 29 and 30 next, classes will be set apart for cut flowers, plants, and fruits, and suitable premiums awarded. Thomas Bog is secretary and treasurer.

**Waco, Texas.**—The second annual chrysanthemum show of the Waco Floral Society will be held November 10 to 12 inclusive. A neat premium list has been issued, which contains valuable pointers on the cultivation of the Autumn Queen on the Gulf Coast. Mrs. M. B. Davis is secretary.

**Portchester, N. Y.**—The Westchester County Gardeners' Association will hold a chrysanthemum exhibition in Fehr's Opera House, on November 5 and 6 next. A. Guerson, Rye, N. Y., is secretary.

**Indianapolis.**—The final premium list for the eleventh annual Chrysanthemum Show and Floral Festival, given by the State Florists' Association of Indiana, has been issued. The exhibition will be held at Tomlinson Hall, November 2 to 6 inclusive. R. A. McKeand, Garfield Park, is secretary.

**Trenton, N. J.**—The tenth anniversary great Inte-State Fair will be held Sept. 27 to Oct. 1. The premium list has liberal provision for the various products of the garden: plants, vegetables, fruit, preserves, pickles, etc. J. S. Mount is superintendent of the department for agricultural and horticultural products.

## Raspberry Notes.

**Bateman's Early** (red) raspberry is desirable as an early market variety. It will carry well, not being as soft as most reds. Very productive, canes of slender growth, but quite hardy; erect grower and never allows the fruit to reach the ground. Can be set four feet apart each way. The largest crop of red raspberries I ever saw on a small patch was grown from this variety. The patch was heavily mulched with marsh hay and the soil was a heavy loam with a sub-soil which had to be loosened with a pick. It is not more than two-thirds as large as Cuthbert, but in most other characteristics resembles that variety.

**Columbian** is a good grower. It will evidently set lots of plants, as every lateral seems to have the push and vigor of growth in it. It will be no trouble to get from 20 to 25 plants from many of our hills which were set last spring. The color of the cane is all that could be desired, and looks healthy. As we set our first plants of them this season, I cannot speak yet as to the value of the fruit.

**Coarath.**—This variety is a blackcap of a vigorous growth and seems to promise well, judging from spring-set plants.

**Doolittle.**—Just as good as ever, and seems to have the same vigor of growth that it used to possess, and, by the way, it still produces some fairly nice berries.

**Cuthbert.**—Here is the red raspberry which will not be discarded for many years to come. Nearly all gardeners are acquainted with it and if those who have grown it with care have not reaped a fair profit from it as compared with most other varieties, their experience is an exception to the general rule. Its color is attractive. Responds well to plenty of manure and good cultivation. Brought us 2c. more per quart this season than any other late red raspberry. It is among red raspberries what the Worden is among Grapes. With a heavy straw, marsh hay, or dust mulch, the berries grow to a large size. The demand with me for plants and berries has always been all that could be desired. We make it a rule to scatter three to four forkfuls of manure over the ground around each hill in the fall or early spring when fruiting it another year.

**Caroline Yellow.**—My experience with this variety is that it is very productive of berries of a beautiful golden-yellow color. I do not like the flavor, but most persons seem to think it is one of the finest flavored berries grown. I have grown plants both from tips and from suckers. Would not recommend this variety for market, but for home use a dozen plants of it would be desirable.

**Eureka** (blackcap) has given most excellent satisfaction here; the berry is all that can be desired as regards appearance; plant very productive. All the fruit growers around here who have tried it are increasing the stock of it as rapidly as possible. It ripens soon (two to three days) after Palmer, and is ahead of that variety in most respects. We have quite a quantity of it, but next spring will plant more than ever.

**Golden Queen** I regard as one of the best, if not the very first, of yellow raspberries for market, but, as a rule, I never found much money in growing yellow raspberries for market. They are all right for the home garden.

**Gregg** is about the best black raspberry for late market. When it is in it takes the place of all other blackcaps, chiefly on account of its large size, I have it on sandy and also on clayey soils, and the largest berries seem to grow on the latter. Plenty of coarse manure around the hills makes this variety grow very large fruit. On about 500 hills where we cut the fruiting canes back extremely close, pickers could be heard to say, "I never saw such wonderful berries."

**Hansell** (red) is now regarded more as a relic of the past, although it has a few good points.

**Hopkin's** (blackcap) is a berry of good quality, and I have found it quite productive; a trifle larger than Ohio, and for table use I would prefer it to that va-

riety, but Kansas and Eureka are taking the place of most varieties of the Ohio type.

**Kansas** (blackcap) is very desirable. Fruit is attractive, and sells well in the market. An early variety of vigorous stalky growth; canes are healthy, and grow similarly to the Gregg. Both Kansas and Eureka have many desirable qualities that will put them in first place among raspberries.

**Johnson's Sweet**, (blackcap).—We have been disappointed in this variety.

**Nemaha** (blackcap) seems to be gaining in productiveness. There is quite a difference in this variety on different soils.

**Ohio** (blackcap) did not give as good satisfaction here this season as it generally has. It is a thrifty grower, but to do its best it should be heavily mulched, as it is very liable to be affected by dry weather. There are other varieties which are more desirable and are fast taking its place.

**Progress** (blackcap) has some good qualities, but it has to give way to the more improved varieties.

**Palmer** (blackcap) did not do as well this season as last, on account of dry weather at time of ripening.

**Smith's Prolific** has some desirable qualities, but we wish to test it another year before giving a final opinion of it.

**Schaffer.**—Its unattractive purple color is against it for market, but it has so many other good qualities that it will remain a standard berry in many localities

FIG. 168.—FRUIT DRYING AT HOME.  
(See page 585.)

for a considerable time to come. I never saw it produce so many berries as it has this year, and all of very large size. We shall plant more of them than in the past.

**Turner** (red) bears well when suckers are kept down; of good flavor, but too soft to ship. Will grow where other varieties kill down from freezing in winter, as it always comes through without the canes being injured. It is now generally discarded.

**Thompson's Early** (red).—This was sent out at first at a high price, but has been one of the most disappointing of all red raspberries, considering the amount of praise it received.

## Selections.

Judging from this summer's experience, I would make the bulk of my planting of raspberries next spring of the following varieties: For early black, Eureka and Kansas, with only a few Palmer; for late blackcaps, Gregg and only a few Nemaha; for early red, Bateman's Early; for late red, Cuthbert; for medium to late, the Schaffer (purple).

CHARLES C. NASH, Michigan.

## Apple Jellies.\*

Comparatively few people are aware of the great value of apples for jelly making, and this is more especially true of large raisers of apples.

The greatest factor that has brought out the jelly making qualities of apples has been the Maine State Pomological Society, which has so generally offered from year to year liberal premiums for the best collection of apple jellies made from distinct and named varieties of apples. It has aroused an interest in the subject and excited inquiries which have reached great practical value. At the State Fair last September the exhibition of apple jellies was so extensive and of such a high standard that it was of great interest to the visitors.

Few, if any, varieties of apples are unsuitable for jelly, the possible exceptions being sweet apples, yet I have been successful in obtaining a very good jelly from Tolman Sweet, and the sweet Baldwin, but as a rule they are not adapted to jelly making. The variety in color that may be produced ranges from the almost white jelly of the Yellow Transparent apple, to the deep crimson of the Red Astrachan, and the flavor from the delicate flavor of the Porter to the sharp acid of the Quince apple.

To state a definite rule by which to make apple jellies would be difficult and perhaps impossible.

It does not require the first grade of apples, the second quality of fruit being just as good, but it is very necessary that the apple has attained its full growth, is of good color, and as near ripe as possible.

A general rule is as follows: Quarter the apples, using peeling and all, as the peel is in a great measure responsible for the color of the jelly. Place the apples in a large porcelain kettle, using to every four quarts of apples, two quarts of water for fall apples, and three quarts of water to four quarts of apples for winter fruit. Place the kettle upon the stove and allow the apples to cook until they become just soft, but be careful that they do not cook until mealy, pour into a large flannel bag and allow the juice to drip through into a dish; it may be well to squeeze the pulp a very little to get the full richness of the apple, being careful not to get any of the pulp into the juice, as it spoils the clearness of the jelly. Now place the juice in the kettle, having it spread over as large a surface as possible, as it boils down much more quickly; let it boil rapidly for ten minutes, all the time skimming off whatever scum arises to the top.

While the juice is boiling the first time, have the sugar in the oven heating, allowing one pound of sugar to a quart of juice. When the juice has boiled for ten minutes, stir in the sugar rapidly and allow it to all dissolve, then strain it again to take out whatever impurities there may be in the sugar. Now allow the juice to boil the second time until it will just drop in heavy drops from the spoon; this will require, on an average, about ten minutes. Now the jelly is ready to pour into tumblers. Allow it to cool until thoroughly hard, and place a piece of wax paper over the top; be sure the covers to your tumblers fit tight, then place in a cool, dry place.

In the making of all these jellies one must necessarily depend some upon judgment, for some apples will jelly quicker than others, some will require a little more sugar, and some a little more water for boiling. It makes a great difference in the time of year when the apple is used; the nearer to the time when the apple is taken from the tree the better.

After trying over forty different varieties, the best returns came from the Porter, Astrachan, Yellow Transparent, King Tompkins, Duchess of Oldenburg, Killhamhill and Alexander for the fall apples, and the Bellflower, Ben Davis, Greening, and Baldwins for winter apples.

The Porter and Bellflower stand at the head, the Porter being replaced in the winter by the Bellflower, and that much abused apple, the Ben Davis, is one of the very best apples for jelly.

\*Paper read by Alanson S. Grant, at the Maine State Pomological Society.

## Mats for Protecting Hotbeds and Cold Frames.

Our attention has recently been called to a substitute for straw mats, so generally used in protecting hotbeds and cold frames. The mats in question are used by gardeners in certain parts of Switzerland and are made of ordinary canvas and excelsior. In making the mats the canvas is laid on a table and a layer of excelsior  $1\frac{1}{4}$  to 2 inches thick is spread upon it. A covering of canvas is then placed on top of the excelsior, and the whole is quilted with strong thread, in blocks about 4 inches square. The edges are of course firmly secured, and the mat is then ready for use. Ordinarily, they should be made to cover two 3x6 sash, and have projecting ends of about 8 inches; that is, the mats, when finished, should be about  $7\frac{1}{2}$  feet long and 6 feet wide. The projecting ends are important, as they keep the cold from the sides of the bed and offer a place for laying a scantling or board to hold the mats down. Mats made as described are said to last as long as straw and to be warmer and more easily handled. The canvas costs about 10 cents a yard, and the excelsior 2 cents a pound. At these prices, the cost of a mat covering two sash would be about 65 or 70 cents. Doubtless the protection cloth used by seedsmen would answer excellently for the mats. This cloth is prepared to withstand water, and for this reason it would last longer than ordinary canvas.

Another form of mat extensively used by Violet growers in Virginia is made of burlaps and straw. Recently while visiting the Violet growers near Gordonsville, Virginia, we had an opportunity of making some inquiries in regard to these mats. Mr. Taylor, who has about 400 sash in Violets, kindly furnished the following facts on the subject:

The mats are made of 12-ounce burlaps, 45 inches wide, costing about 6 cents a yard. The straw between the tackings of the mat is about 2 inches thick, but at the part where the tackings are made it is only about half an inch thick, as the string is pulled tight and tied in a square knot to prevent all danger of its getting loose. A woman can make about 15 mats a day, making the total cost about 35 cents each. The burlap mats are not very durable and are a constant source of expense. By the end of one season the straw has worked up to such an extent that the mat will not be warm enough for another winter. The burlap usually lasts but two seasons with the rough use it receives. With care the mats should last two seasons without making over, and the burlap might perhaps be made to go through three or even four winters with good attention.

Altogether it is believed that the excelsior mats would prove more durable and satisfactory.

## Home-Made Fruit Drying Imple- ments.

For drying fruit for home use, or in a small way for market, one may use to advantage the slicer and corer shown in fig. 168. A bit of tin tube, with one end made sharp, will take out the core from an apple "with neatness and despatch." The whole apple can be sliced with one movement by the use of the frame shown at a, in which are set eight or nine old and very thin "case" knife blades, the handles of which may have disappeared. The frame can be cut from a piece of inch pine board. Slices are sawed for the knife blades, which are wedged in tight. The circles of apples can be strung very easily, being whole, and placed on a light frame, as shown at b. This can be set in the sun and easily moved indoors at night. If the slices are made a quarter of an inch thick, eight knife blades will cover an ordinary apple.

The two fruit exchanges of Baltimore, Md., have combined, so that the control of the trade in that city is now under one head.

## Injury to Violet Leaves.

Our Violets this year and last were injured by a small caterpillar-like insect, which L. O. Howard, Entomologist of the Department of Agriculture, reports to be the larva of an undetermined saw-fly. In the accompanying figure is shown some leaves injured by the worms.

Usually the injuries are first noticed early in June, and in our experience the trouble is confined to plants under glass, especially those growing in the shade. The row of plants under the gutters or next to a side wall almost invariably shows the most severe injuries. When full grown the worms are greenish-brown and are seldom more than half an inch long. They are difficult to find, but during the day can usually be seen, apparently resting, low down on the leaf stalks. Seldom more than two of the worms are found at one time on the same plant. Two, however, are enough, as they will riddle a half-grown plant in a week. Hand-picking has been tried and found to be effective but slow. Roseleaf extract of tobacco, diluted at the rate of 1 part extract to 80 parts water, is effective when put on with a good spray pump, but we do not like to use this or any other sprays on our plants, as they all have a tendency to weaken the tissues and bring on spot.

The most satisfactory method of dealing with the pest is to fumigate with hydrocyanic acid gas. We fumigate

FIG. 169.—VIOLET LEAVES INJURED BY SAW-FLY.

about once a month, and find that we are not only able to keep down the saw-fly larvae, but cutworms and the black and green aphids as well. Slugs and snails are also killed by the gas, and, much to our regret, our colony of toads, which we prize highly as greenhouse adjuncts, were, through an oversight, also annihilated a few nights ago.

We find the gas treatment for Violets simple, easy, and cheap, and although we have used it for more than a year on plants of all ages, from a sand cutting to a full-blooming crown, we have never seen any injury resulting therefrom. Where Violets are still in flats, that is, where they have not been transplanted to permanent beds, dipping in rose-leaf extract might be followed while the transplanting is going on. Put a pint of the tobacco extract in a pail of water and dip the plants (25 or 30 in a bunch) in this solution. Dip the leaves only, and when set in the beds syringe lightly, in order to wash off the more or less sticky juice. B. T. GALLOWAY.

The yield of small fruits in the Hudson River valley so far has been up to the average of previous years, but the prices received have been discouraging. The two main crops now are peaches and grapes, and the quantity of both it is expected will be enormous. The peach crop looks promising, and probably will be one of the largest and finest ever gathered.

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

Is there danger of a strawberry or other small fruit plant being overstimulated, or in other words, can it be fed so heavily year after year that it will be injured, as is the case with a horse or other domestic animal being overfed?

One-fourth to one-third of the limbs in the tops of an old apple orchard are dead, and the owner wonders what is best to do to put it in the best condition. My advice is that the trees which are in the best shape receive a load of well-rotted manure, to be scattered evenly over the surface of the ground as far out as the limbs extend. Prune the trees severely, and cultivate well during summer. Dig out those trees which are badly affected.

A village lot was planted to potatoes last spring, having been plowed last fall; about the same amount of ground alongside was planted the same time, it had been plowed in the spring. Both plots were given the same care. On the fall-plowed ground the potatoes are making a much better growth and are much superior to those on the spring plowed. It seems that the fall plowing proved the best for retaining the moisture.

There is a fine patch of the Wilson and Warfield strawberry grown in hills. The plan is to grow alternately in the row a hill of Wilson and one of Warfield. There is no doubt that Warfield's No. 2 will be laden with well-formed fruit.

In layering plants of Schaeffer raspberry, it is well to have the tip point almost straight down and not to layer too early. If layered at too much of an angle, it pushes out of the soil, often making but a few roots, and when layered too early, the little germ at the crown starts in to grow in the fall, these severe winter weather freezing the tender shoot back.

In improving varieties of small fruits we select out of each variety those having the highest number of good points and propagate plants from them.

After a good shower we like to start the cultivator to hold moisture, but we do not start until the soil is in a "mealy" condition or not too wet.

One gentleman near here generally has a good crop of apples and raspberries on the same ground, but he keeps the ground covered the year around with a heavy mulch of straw and marsh hay, so the soil cannot be seen at any time. The mulch is well loosened up in spring and fall to give air to the soil before putting on more.

Many growers in Michigan being disgusted with the price of small fruits this year, are plowing under a part of their plantations. This means a fair chance for those who keep at it.

With regard to asparagus, we find there is more in the richness of the ground than in the variety.

We have found by experiment that black raspberry plants should not be set too shallow, the plants which were set three to four inches deep (four inches on sandy soil is none too much), stand up straight, but on those which were set a scant three inches deep, the canes will have to be staked and tied up.

I have a small plot of poor soil on which I am trying the experiment of letting all the rag, pig, and fine weeds grow that will, and just before they go to seed, plow them under for fertilizer; thus I expect to prove the virtue of weeds as a green fertilizer for run-down soil as compared with cow peas, corn, millet, or rye.

It is profitable at this season of the year to cultivate the late cabbage early in the morning as possible while the dew is on, especially if the weather be dry.

Not a weed should be allowed to go to seed on the lawn.

We must have a good pile of sods piled up with alternate layers of poultry manure; it is one of the most satisfactory of fertilizers when allowed to rot and shoveled over a few times before next summer.

CHAS. NASH, Mich.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1897, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per square line; in "For Sale" column, 5 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signalories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

**Catch Crops.** THE most important, hence the most valuable, food for plants is that produced by plants, the mould from their decomposition. The plant is constantly at work storing up food for some other plant to feed upon, and no matter what changes it may undergo, whether or not it serves first food for man or beast, in the end it becomes plant food. It is this food to a large extent that we apply to the soil in the shape of manure, and in that case, too, it must undergo decomposition or a breaking down of its components before the plant can feed upon it in its entirety.

The quantity and quality of the plants we are able to produce from a given area depends to a great extent on the quantity and richness of the food given them, whether it be naturally present in the soil or applied.

While it is true that a soil may not produce a desired crop without applications of manure, it is equally true it may not yield another crop with it, unless the

food given contains the elements that are specially desired by the crop. It is indeed possible by the application of manure to make the soil poorer, instead of richer, at least, to make it less productive for a specified crop from the farmer's standpoint.

In a general way, it may be said that no two crops take from the soil the same elements of food in the same proportions; neither do they return to it the same, each has its own work to do, and each prepares or renders available, food for some other. Take the cabbage which is a gross feeder, requiring for its perfect development more manure perhaps than any other plant grown as a general crop.

What we term manure may or may not be plant food, it depends upon what its composition is and what it is used for. We take, for instance, a piece of heavy sod underneath which is a lively loam; after plowing give the surface a heavy covering of well-rotted stable manure, and we will have the soil in the best possible condition for a crop of cabbage, from which if the season is favorable a yield of 25 tons per acre can be obtained, at the same time the cabbage will return to the soil, by plowing under the stumps and outer leaves from the heads, sufficient food for a heavy crop of cereals. But, if we continue to grow cabbage for three or four years in succession, even though we put on just as heavy a covering of stable manure as we did in the first case, we could not then get a satisfactory crop of cabbages. Why? Simply because there is not in the soil that which the cabbage takes out, and it cannot be put in except by allowing the soil to be occupied by some other crop, so it can recover tone; for so far as the cabbage is concerned, the soil is impoverished, it is still intensely rich for some other crop.

The cabbage is generally considered an exhausting crop; so it is; but it will give back as freely as it takes if so handled, and as a catch crop, where it is grown only as a fertilizer, it is one of the best that can possibly be used. For instance, where there has been a crop of early potatoes, and the ground has been cleared by the middle of August, the cabbage can be employed to the best possible advantage. The seed in such a case should be sown thinly in drills not more than two feet apart, and by the middle of November, when the ground will be completely covered, the crop should be plowed under, and rye sown thickly which will keep the fine soil from drifting by the winter's winds.

One of the best possible illustrations of this principle of rotation, and one crop improving the land for another to follow, may be found where beets are grown for sugar purposes. Experiment has shown conclusively that the beets cannot be grown to perfection on the same soil oftener than once in five years, as the reserve to form the saccharine matter which the beet makes, is not replaced in any shorter period. The chemist can tell to a point what the active principle in the beet-root is, but he cannot put it into the soil in the necessary condition, or make quickly available what is there. A previous crop, however, can do it, and, after experiments, carried on for nearly 100 years, it has been ascertained that the best "catch crop" for the sugar-

beet is wheat, and it takes at least two crops of that.

Stable manure and commercial fertilizers will excite plant growth, they will give a heavy crop of beets, as often as every second year, but the root will not contain the principle for which it is grown. Nature holds the key to that secret of availability, and we have not yet found it.

The foregoing remarks illustrate in some degree the importance of growing crops as agents in the production of other crops, that it may not be as useful in itself as it is in the preparation of the soil for something to follow. The soil should be constantly at work; the moment one crop is taken off, another should be put in.

The question then arises, what is the best "catch crop," or what crop can best be employed to furnish food for some other? Although a simple and natural question to put, it is a difficult one to answer satisfactorily in a general way; so much depends on circumstances. There is one answer, however, that will fit all conditions, and that is, grow what you can grow to the best advantage.

Where clover can be grown with any degree of certainty, that is decidedly the best crop, because it takes from the earth and air, and gives back to the earth such a wealth of available food that all other plants require; it enriches the nitrogen supply.

Where clover will not grow, then we should come as near to it as we can with some other leguminous crop. There is not a locality where if some one will grow, it should not be used.

In the garden or field, on heavy or on light soils, spinach grows readily, and it is one of the best "catch crops" that can be found; it grows quickly, covering the earth in a short space of time, and is rich in food for some other plant.

In the market garden there is always something that can be grown at a profit, here vegetables can be the "catch crop," and they will answer every purpose, only when they occupy the ground at all times, the barnyard must supply the humus and the nitrogen, and commercial fertilizers the mineral salts.

**Garden Development.** THERE are certain definite principles which govern the laying out, "landscaping," of any area of land, be it large or small. Though the conditions may vary and the details be as different as the places seen, yet if the fullest satisfaction is to be had from a garden, adherence must be given to these governing rules.

Perpetual succession of effect is a prime factor. No garden can be fully satisfactory to its owner if it present a good appearance at one season only, except of course, at places where one resides for a short period.

Given an area of land and a house, there are always certain prospects in looking to the house and others in looking from the house which should be maintained and emphasized. How to do this depends largely upon the skill, the soul, of the artist and his knowledge of plants, their forms, and color values. The skillful landscape gardener seizes upon the natural and salient points of the ground, also observing the weaknesses such as

those points which give limits to effect. He develops the one and subdues the other, striving to give the impression of unlimited extent so far as is possible, using for this purpose and surrounding of importance. It is not evidence of skill to hide a wooden fence by simply planting another of trees or shrubs in front of it.

Though general principles are definite, their actual adaptation will not conform to cast-iron rules. We cannot lay down on paper, in words, any minor details that will suit all conditions. The utmost that can be done is to show a few selected examples and specimens of work, and from them point a moral as occasion demands. To this end we have arranged to issue during the next few weeks a series of landscape plans, from which it is hoped our readers will be enabled to derive many valuable hints. These plans will be of various natures and will deal with problems which have been suggested by our correspondents.

#### Plants Received.

**Heliotrope.**—From Mr. A. Weising, Brooklyn, N. Y., we lately received a plant of the new Heliotrope known as *giganteum hybridum*. This differs from the ordinary forms by its assuming a tree form and flowering in a large head on the top. This character, the grower informs us, is constant whether the plant be raised from seed or from cuttings. The plant submitted was 30 inches high, and had most vigorous foliage, yet we are informed, was only of medium size. The seed was not sown till the end of April. Weigelt & Co., Erfurt, Germany, are the introducers. The novelty has much to commend it, especially for bedding purposes; its erect growth making it desirable for the mixed sub-tropical garden. The color, size of bloom, and fragrance are all that can be desired.

**Gladioli and others.**—From John Lewis Childs, Floral Park, we have received a large and varied assortment of choice annuals and perennials, chief among these are some superb Zinnias, which, in range of color, brilliancy, and form would be hard to beat.

Star Phlox was also noticeably fine; another pleasing, and at the same time old, favorite was a bunch of *Daphne cneorum*, a specialty with this firm.

**Rudbeckia "Golden Glow"** is a variety of the wild *R. laciniata*. Its fine double yellow flowers proved to be good shippers and displayed fine keeping qualities; it is a superb border plant.

In a batch of Lilliums were *L. Wallichi*, *L. Henryi*, and varieties of *speciosum*.

The collection also included a large number of named Gladioli, of which the following were selected: of the *gaudavensis* type, *Corsair*, a beautiful dark; *Mascurville*, a very peculiarly marked red with yellow throat. *Snow White* is what its name indicates. *Glory of Brightwood* was almost a scarlet, fine large flowers and a yellow tip. The collection of Gladioli at Floral Park is famous for what is now known as the Childs type; these hybrids are distinguished for their great size, erect habit, and wide range of colors. Among these we mention specially: *Torchlight*, a most brilliant scarlet; *Ruby*, well described by its name; *Mrs. La Mance* is a grand light pink; *Daisy Leland* is a bold, large red; and *Falconer's Favorite* is a dark red with great character, the color is almost maroon and is enlivened by white median vein to each petal.

#### What It Costs to Win.

Mr. W. J. Eldred, who was awarded the majority of the first prizes at the Springfield, Mass., Sweet Pea Show, gives more time to his pets than many have any idea. He begins his season's work in the winter long before the snow is gone, by reading all that can be found on Sweet Peas. Then in March he begins working the soil and gets his seed in as early as possible. From the time the seeds are

planted until the vines take to the brush, some time is spent every day searching for cutworms and other insects that might injure their growth. From now on he spends an hour and a half in the garden before he goes to work in the morning, about half an hour at noon and from 6 o'clock until dark, every day when the weather will permit. The money outlay this year was about \$50 for seed, manure, etc. Mr. Eldred has experimented several years with crosses and it will not be long before we shall hear from his labors. Mrs. Eldred grows Begonias and has the largest collection in her district.

#### The Canadian Apple Crop.

As the reports given us by different parties agree in the main, we publish them with greater confidence as affording a pretty accurate idea of the yield. In the majority of the orchards west of Toronto as far as St. Catharines, the prospects favor a good crop of Greenings and Northern Spies, the fruit having a clean and fine appearance; but red fruit, such as Baldwins, are a comparative failure. West of St. Catharines a moderately good crop of Greenings is promised and a fair yield of Spies with a good sprinkling of Russets. There is the same paucity of red apples in these sections as noticed between St. Catharines and Hamilton, and in sections north and northwest of Toronto. East of Toronto, as far as Brockville, there will be a fair crop of green fruit, and in some orchards a good sprinkling of red fruit is observable. —*Montreal Trade Bulletin*.

#### Prosperity Coming.

The crops this year are not larger than they have been for some years. The four largest crops of corn ever raised in the United States yielded \$300,000,000 less than the four smallest crops. Not only is this anomaly true of corn, but also of potatoes and to some extent, of wheat.

The foreign demand for wheat is excellent. European countries will not give the yield that was expected, and the deficiency will be filled by American wheat, which now is 20 cents higher this year than last.

The price of potatoes is double what it was last year. Corn has advanced three cents over last year, and cattle 50 cents per 100. Wools a third higher and sheep has advanced a fourth in value. There has been little change in the price of oats or dairy products.

The increases in price will result in putting money into the hands of farmers. This will be used to pay creditors, who will liquidate indebtedness. Thus prosperity will illuminate the whole country within a short time.—Assistant Secretary of Agriculture J. H. Brigham in an interview.

#### Chain Gangs in the Parks.

It is unfortunate that the Park Commissioners of Brooklyn have not the money necessary to complete the work planned for beautifying the parks of that city, which are already among the most beautiful in the world.

Likewise it is deplorable that, under a mistaken conception of the law, the Commissioners of Charities and Correction are unable to find any work to occupy the minds and muscles of the inmates of the Kings County jail.

But neither condition justifies the employment of striped convicts under armed guards on park work. The reported agreement of the Park Commissioners and the Commissioners of Charities and Correction to that end is one which should be quickly nullified. Chain gangs are neither a pleasant nor a civilizing adjunct to a park. The public employment of convicts, in all the appanages of penitentiary service, is invariably depraving. It is an indication of a low state of public refinement and an affront to the better sentiment of the community.—*New York Journal*.

—We say by all means employ the convicts; and how better than on public works?—Ed.

## Still More About Summer Planting of Strawberries.

To the Editor of American Gardening

I have read with a great deal of interest, and not a little amusement, the several articles by Mr. Hale and Mr. Dwyer, on the summer planting of potted strawberry plants, and also that by Mr. R. M. Kellogg, all of which have appeared in the *American Gardening* of late. These articles were written by men who stand high as representatives of the strawberry interest in the country; yet there seems to be a strange disagreement between them relative to the value of summer planting, which may be hard for some to understand, and to decide which advice is better to take. Those who have had years of experience in summer planting of strawberries with all the conditions which are likely to exist with them, and a fair understanding of humanity can read these articles without any perplexity or difficulty, but the amateur and credulous need something more tangible upon which to hang their reliance than this maze of contradictions.

It seems to me that Mr. Hale has shown up rather the darker side of summer planting, while Mr. Dwyer may have given the extreme brighter; yet, by the light of my experience, I can see that he has not shown the impossible; nevertheless, it may be said that his statements were misleading, inasmuch as he has not made it clear that not one in 10,000 of his customers could expect to get those great results—all conditions must be combined favorably, and far the most dependent upon the person or persons entrusted with the care of these plants. I like Mr. Kellogg's talk; he presented correctly the real truth till he got in his "pedigree" talk, then I felt like saying, "Rats." Well, we will have to forgive Mr. Kellogg for we all know by this time, or at least, should know, that he is a little cranky on that, just as you will have to forgive me, as I am just as cranky against such absurdities which have no foundation either in facts or theory, and which do much harm by teaching error and leading astray the credulous. The fact, that Mr. Hale is probably the greatest seller of layer plants for spring setting, and as far as I know, does not sell any potted plants for summer planting, and Mr. Dwyer a great seller of potted plants, and Mr. Kellogg of "pedigrees", of which he has seemed to have made a corner, may be only a coincidence and had nothing to do whatever in dictating their writings, but it is well for all those readers who are seeking after the real truth to give this matter careful consideration.

I have grown many thousands of potted plants for my own setting and for sale, and the fact that each year I have been the greatest customer myself for these plants shows clearly that I have the opinion that they can be made profitable even in this far North.

E. W. WOOSTER, Me.

To the Editor of American Gardening.

—Allow the writer to say that his experience with fall planting of strawberries the past season will throw some light on the question of spring or fall planting now at issue in your columns. Last summer the white grub destroyed a number of my plants of my spring setting, which were replaced by fall-set plants. My spring plants had made the usual number of plants from runners, which usually are much too many for best results; the more fertile the soil the more unprofitable extra plants. The novice likes to see them "spread themselves," and cover the "face of the earth." Indeed, it is a trial to the beginner, and to the older grower to decapitate the youthful plants. Hence, as a rule, the average strawberry grower allows his spring-set plants to make too large an increase for best results; such was the writer's case. But his well-selected fall-set plants did not and do not make the aforesaid runners and plants, but develop fair-sized, single crowns with no extra plants standing in the light. And how they did spread themselves this spring, with large berries on vigorous stems spread out like the spokes in a wheel—well

loaded with fine fruit. Fall-set plants, well grown, well cultivated, in good soil, with favorable season, will make a glad-some return to the amateur, but will not yield the ample returns required by the market gardener.—G. N. CARRUTHERS.

*To the Editor of American Gardening.*

—Mr. Kellogg says (page 583) that it is a mistake for commercial growers to set strawberries in the fall. It is, if done too late. Summer setting is far better done just as early as suitable plants can be had. The soil he describes is just the right place to secure a profitable crop, even if potted plants have to be purchased. Building up a reputation by only growing strictly first-class fruit, will secure a permanent hold on the market, and the way to do that is by planting the vines as near "nature's way," as may be possible, which is in summer. A plant matured for fruiting cannot be in its best condition to make plant growth (even if dormant), its tendency is to make seed. Failing in this (by the removal of blossom buds), it resorts to the process of reproduction, by sending out runners, thereby exhausting much of its vitality, even if runners are kept off. Such plants will not, cannot produce the finest fruit. The large overgrown fibrous-rooted plants used generally in spring setting, are about as poor to plant, as a fruiting peach or apple tree, and "pedigree" soon runs out of such, unless great care is taken to select those showing strong resistance to such treatment. Isolated plants will show a large growth of foliage, because of plenty of room and a large supply of nutriment, but such are not profitable from a commercial point of view. When two or more plants occupy the same space, the nutriment must be divided, to the detriment of each; therefore, plants must be crowded as close as is consistent with quantity of fruit. Much is dependent on the variety, evidently; a large stocky plant requires more space than a slender variety. I find that such fruit as Mr. Kellogg describes, "immense berries, rich in flavor and sound to the core," is best grown on plants set in July and August, and urged to make the utmost possible growth, and every plant, expected to fruit, set in by itself, whether it takes 7,500 or 20,000 to the acre. As Mr. Dwyer says (page 589), the possibilities of the strawberry under favorable conditions are away beyond the expectations of the average grower.—HENRY SNYDER, Md.

*To the Editor of American Gardening.*

—We always like to read a good discussion on any topic of interest to the horticulturist. Thanks to Messrs. Hale, Dwyer, and Kellogg for the strawberry discussion.

I have tried both methods, but have a preference for spring planting of strawberry plants. There are some things to be gained by the plant grower in setting a few each of the new varieties in the fall and protecting well during the winter, but for the fruit grower, I have never seen it pay quite as well as spring planting.—C. C. NASH, Mich.

## Lawns in Parks.

*To the Editor of American Gardening.*

If a gardener can be found who can maintain a lawn in early spring, such as one would wish to see in a garden vista, where an unlimited number of people walk upon it at all times, I should like to make his acquaintance.

I have visited parks, and have had some experience in park work; and my observation and experience is, that even when strolling for pleasure, the shortest, open, feasible way will be followed by the pedestrian. He does not stop to moralize, "That it would be a sad commentary upon the intelligence of the American citizen," if in walking over a beautiful lawn the same way many times he will tramp out the grass and make an ugly footpath, but keeps straight on his way.

I do not regard this as any reflection upon his intelligence or citizenship. It is simply an instinct, common with all, and the intelligent park maker will recognize this as a fact, and provide foot-paths in

place of lawns, where any considerable number of the public desire to reach the same destination, and require the pedestrian to keep upon the footpaths.

If respectable lawns are maintained in parks, "where an unlimited number of people are permitted to walk upon them at all times without injury," it is certainly where the conditions are such that there is only a limited desire on the part of the public to use them for that purpose; for no one will claim that grass will grow if continually walked upon. There is never a long-enforced general rule or law, without a good reason; and the general rule as to lawns so long in force to "Keep off the grass," is not an exception.

I do not wish to be misunderstood, however, for I agree that the principal areas of parks should be open for the public to walk upon, without restraint; but there should be an occasional vista where garden art may be produced for their entertainment, and here a well-kept lawn, unmarred by footpaths, is a necessity.

VOLNEY ROGERS, Youngstown, O.

## More About Early Maturity.

*To the Editor of American Gardening.*

There are several methods which may be used to secure the early ripening of fruit or seeds, but in nearly every case the size of the plant or its natural vigor is affected by the treatment.

When plants are brought to our more Northern climate from the South, they must become accustomed to it before they can be successfully cultivated, but during acclimatization the plant becomes changed; it is smaller and comes to maturity earlier. Thus a change in climate hastens maturity by reducing the natural size of the plant. However, we find that the increased earliness in the maturity of dwarf trees is not due simply to the reason that they are reduced in size, but more likely to the same reason that causes the tree to be a dwarf; for when the free passage of the sap from the foliage to the roots is prevented, it is found that the result is an increased tendency for young trees to produce and nourish blossom buds.

It is well known now that the condition of the seed has much influence on the plant. If very green seeds are planted, we may expect, first, a smaller percentage to germinate; second, from those that do germinate, a weak and feeble plant; and third, an increased earliness in maturity of the plant. Nothing shows this better than a study of the tomato; many experiments have shown the same results. And this suggests the probable origin of our early varieties of tomatoes. Notice, if you will, the peculiar shriveled foliage, the dwarf plant, and the inclination to blight and decay of the fruit to a greater or less degree in all our early varieties of tomatoes.

This indicates that these varieties have resulted from the use of green seeds. The conclusion from this is that although the choice of seeds may induce earliness, yet these seeds must be in such a condition as to reduce the natural vigor of the plant.

A comparison between early and late varieties of potatoes shows that all early varieties are of feeble growth, and again we have the suggestion that early maturing varieties are obtained at the expense of the natural vigor of the plant.

The nature of plant food, the condition of the soil, special treatment of the seeds, or conditions of germination, all these may hasten the maturity of the plant, but the plant will generally be changed in either size, form, or vigor.

If early maturity is desired, something must be done to draw the growth forces in that particular direction, and this means less growth force in some other direction which results in smaller or more feeble plants. The point I wish to bring out is that the early maturity of plants, either as individuals or as races, is generally brought about by reducing the natural size or vigor of the plant.

L. W. ENGLISH, Vermont.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

## Mignonette.

Having been asked many times in a season how I grow the fine Mignonette, which I send to New York market, I furnish the following information on the subject:

I first clean all the old soil from the benches, and remove whatever accumulations of dirt there may be under the benches, which I then wash down thoroughly, so that all the cracks therein are open and clear to allow of good drainage. When the benches are well dried, I give them a good coating of whitewash, and sometimes two, if I find it necessary on older benches. When well dried they are ready for soil. My cleaning for Mignonette is generally done when we have time, or get a good cool day before planting time; and I work on the same plan as regards filling all my houses. At the best, it is no snap—cleaning and filling houses.

In preparing soil for Mignonette, I put about two inches of fresh cow manure on the bottom of the benches; then three inches of good stiff soil, well mixed with cow or stable manure or both, as it makes very little difference which is used. After firming the soil somewhat, and smoothing it, I mark it off in spaces one foot apart each way in three rows, across the side benches, and four rows on the center benches, as a greater number of rows is too unhandy to work when the plants are large. I then make small holes on the cross marks, and fill them with some light soil on which to sow my seed, as our soil forms a crust after the first watering and sometimes will not permit the seedlings to push through. I sow seed with the point of my knife, by pressing it in the soil about half an inch, the seed being on the blade. I find the work can be done thus quicker and more evenly, than in any other way. After the seed is sown, I keep the soil on the wet side until the plants are all well up, which should be in five or six days. The greatest trouble I experience is in keeping the small plants from damping off, until they get their second pair of leaves well developed. After that there will be very little trouble from damping. I sow the seed about the last week in July.

The worst enemy of Mignonette is the cabbage worm, which is introduced by the common yellow butterfly, which deposits its eggs on the small plants; in a few days the eggs hatch, and it is surprising how fast the little pests grow. But as we have no use for them, we mix a teaspoonful of Paris green with two gallons of water, and sprinkle the plants once a week, thus keeping the worms in check until the flower spikes begin to show. The plants are then gone over and the worms picked every few days, as I consider it too dangerous to use Paris green on anything that is to be sent to market soon after the insecticide has been applied.

As the plants grow, I keep them tied up to string or wire, held in place by any of the modern devices, or the methods best adapted to the position of the plants. The tying must be watched with all eyes, so as to have good, straight stems and heads.

Then the disbudding must be well looked after; all side shoots must be taken to within four inches of the soil, so as to throw all the growth possible to the leading flower spikes.

I commence to cut from the 1st to the 15th of October, and obtain a continuous crop until the first of June, by giving plenty of feed, mulching with stable manure and diluted sheep and cow manure, also guano water. I am not much afraid to over-feed Mignonette; the trouble with me is generally the other way—to find time to give it enough. It is a very hungry plant.

In selecting my stock, I pick out the best-looking plants in foliage, strength of stem, size of individual flower, length, circumference, and compactness of spike, and carry the first and leading spikes through the season. These sometimes attain three and a half feet in height; by this means I keep on getting a better strain of Mignonette every year.

## The N. Y. Botanical Gardens.

In the matter of the New York Botanical Gardens and the strenuous efforts that have been made by interested individuals to serve their own ends, the following report of the Park Commissioners is of public importance:

"This department, realizing the importance of the subject, appointed a committee of experts to examine and report upon the general scheme for laying out the gardens, as prepared by the Board of Managers and Scientific Directors of the Botanical Society. To the report of this committee of experts the Commissioners have given close attention and careful consideration before taking final action in the matter. The result has been a material modification of the original plan, in accordance with the views of the experts, and the adoption by this board of most of the recommendations and suggestions contained in their report. A visit was made to Bronx Park, the several locations were examined, and the Commissioners listened to the arguments of the experts presented by Mr. Olmsted, and of those of the society, presented by several of its directors. We were unanimously of the opinion that the proposed locations of the conservatory and powerhouse were objectionable on account of the beautiful landscape features of that region of the park.

"In dealing with a problem of this sort the Commissioners are charged with one serious duty, which must at all times be paramount to every consideration—to preserve against every attempt at interference with the natural scenery of the park. The primary purpose of a rural park within the reach of a great city is to maintain that rest and refreshment of mind and body which come from the tranquillizing influence of natural scenery. All other additions to the attractions of the people's place should be subordinate to the controlling purpose in design and maintenance of such pleasure grounds. Anything which interferes with the restful quality of the scenery, in so far as it destroys the highest value of the park. The most careful scrutiny is demanded of any proposition which calls for the erection of buildings on park spaces the purpose of which is not absolutely material to the general scheme of park maintenance or is a necessary part of a special improvement, like the Botanical Garden. For this reason the Commissioners decided to modify the plan proposed by the Botanical Society, in so far as it provided for the erection of a directors' house, first gardener's house, and second gardener's house, and changed the proposed location of the conservatory and powerhouse.

"The Commissioners, in changing the location of the conservatory to the south side of the Southern Boulevard, have followed the recommendations of the committee of experts. No change in the location of the museum has been made from the original plan prepared by the Board of Managers of the Botanical Society. The site selected is believed to be the best that could have been chosen. No valuable trees are sacrificed, and it gives to the museum much more attractive surroundings without marring in the least the landscape features of the park.

"When the board decided to avail itself of the advice of experts it did not surrender the right of final judgment. We believe that the experts were wrong in their desire to place the buildings close together. If the garden, when completed, should become as popular as it is expected to be, the grounds immediately around Bedford Park station would be so congested as to make travel difficult.

"The commissioners thoroughly appreciate the work and purpose of the Fine Arts Federation of New York, and for that reason all the more regret that its council should have passed resolutions condemning the action of this board, which are not in accordance with the facts in the case."

Fruit trees are slow-growing plants, and therefore do not need quick acting fertilizers as a general rule.

## Questions Answered.

Our Inquiry Department is a Bureau of Information, to which subscribers can apply freely for advice on all subjects in the field of horticulture.

\*. We cannot undertake to reply by mail.

### Scale on Nectarines.

(To F. C. D.)—The insects on the twigs of nectarine are those of the San José scale, as presumed by our correspondent. The fruit is also speckled with the same insect, and the cracking and roughness is due to the enfeebled condition of the tree. The history of this destructive pest and remedies for its suppression and control were given in *American Gardening* for May 1 last.

### Fertilizer Crop.

(To W.)—Crimson clover may be sown now and would probably be best for the purpose.

### A Useless Plum.

I have several plum trees loaded down with good-sized beautiful fruit this year for the first, which I purchased of a nurseryman a few years ago, as being very choice, the fruit being light cherry-red, exceedingly juicy and tender, delicious, sweetness, etc., and especially fine for canning. I find them to be prolific in bearing beautiful fruit, without a particle of taste, and I want to know what to do with them. Having no flavor, they cannot be suitable for canning, and they are not fit to eat or to preserve, as I have tried the latter, and they are as tasteless as when uncooked.

Shall I cut them down, and throw away, or cut down and graft choicer varieties, or try to make vinegar out of them, or what?—J. H. C.

—Why don't you send specimens of the fruits? Then we may be able to answer one part of your query. Of course, graft if you want to, but don't say we told you to do so until we know what variety you have.

### Treatment of Bougainvillea.

Will you kindly give me some information as to the proper treatment of a Bougainvillea in order to have it blossom—both summer and winter treatment. Last year it was taken out of the pot and planted outside, and repotted in September. It began to show a few flowers in November, when the gas escaping from a broken main in the street and coming in the cellar, penetrated the conservatory, injured it, all the flower buds falling off and many of the leaves. This year it has been left in the pot in the conservatory, and has not had a single flower. It appears to be resting. Winter temperature of conservatory, 60 degrees at night, 70 degrees and upwards during the day. It is now trained against a brick wall, and must be ten feet high and branching. Would it have been best to have pruned it in the spring and set in ground outside?—OLD SUBSCRIBER, Newton, N. J.

—Probably your plant is *B. splendens* and is thus naturally a little more shy in blooming in early stages than is *B. glabra*. Undoubtedly, the gas killed the blooms last season, but it is more than likely the starving and ripening process may cause it to flower next spring. When the growth begins again, feed a little with liquid manure water, now the roots are contracted. The temperature is right; such pruning that is required to keep the plant in bounds is all that is needed.

### Epidendrums.

I have an *Epidendrum verrucosum* on a little pine block; the bulbs cover the block entirely; in fact, they have no leaves. Would it be best to separate the mass and would it do to put a part on a larger block, and ought the block to be pine, cork, or rough bark? Would it grow in crib or basket in moss, such as plants come packed in? When shall I rest it and what temperature does it require in winter, and what are its requirements as to sun or shade?—H. M. F., Ill.

—Teakwood, red cedar, pine, and cork blocks or tree fern stems are all good, and but little can be said in favor of

either. The old bulbs give strength and help to secure the base of the plant, also at the same time to store up moisture. Do not remove them; new blocks would hardly be necessary. When the clump of bulbs more than cover the space they are on do not divide them, but remove to a larger block. Keep it at a temperature of 68 to 65 degrees in winter and moderately moist. Give nearly full exposure to sun, and rest in the summer.

### Lælia Anceps.

In the fall of 1895 you sent me for premium with *American Gardening*, one plant of *Lælia anceps* on a cork block. It grew that winter one flower stalk, with two flowers, then it threw out new roots quite rapidly and quite healthy looking. I dipped it in water every night according to instruction; then in the spring I hung it on the limb of an apple tree, and it made one or two new bulbs, but last fall I left it with a neighbor, and how she treated it last winter I do not know, but she said it got scale or some kind of insect on it, and she used to wet cotton and put around it. This spring when I came home its roots were all dried up. I did not know what to do for it, but I hung it out under a peach tree as soon as the weather was warm. It shows some slight sign of growth. Would it be best to put it on a new block? What use are the old bulbs after flowering when they grow old and brownish looking, must they always be left on?—H. M. F.

—Make the plant secure on the block it now has and continue your original course of treatment. There is no need to remove the old bulbs.

### Hardy Plants for Winter.

Will you give me the names of a few good annuals that will flower and make a good show under glass the coming winter from seed sown now or later?—J. J.

—You cannot rely on strictly annual plants. A list of select hardy plants for winter forcing would include the following: *Mignonette*, *Alyssum*, *Pansies*, *Antirrhinum* in variety, including *magus alba*, *Campanula media*. From stock plants lifted from the border and potted now or soon, and taken into the house at the first approach of winter and then not kept very hot; *Heuchera sanguinea*, one of the grandest of plants for cutting from its brilliant scarlet spokes being very acceptable. All the above are better from old stock or rooted cutting plants.

### Palms Injured.

The correspondent who sent specimens of Palm leaves with a request for examination, is informed that there is no parasite present, and that the injury is in all probability due to burning, assuggested.

### Plants Named.

(To A. H.)—*Apios Apios*.

### Sweet Potatoes.

(To Subscriber, N. Y.)—As to whether the vines should be prevented from rooting at the joints or not is a debated question. In your locality we would prefer not to allow them to do so.

### Violets for Immediate Setting.

(To G. C.)—We do not know where you can get plants (of the varieties named) suitable for early flowering. There is a scarcity of good stock at present.

**Be of Good Courage.**—Sit down and look the facts in the face, and do not let them scare you. Something is wrong with you. More than likely, and you would have good reason for fear did you not know that Warner's Safe Cure is obtainable at the drug store on the corner. You also know that this remedy is so powerful as to have robbed even the once dreaded Bright's disease of its terrors. Warner's Safe Cure allays inflammation of the kidneys so that the blood passes freely through. Effete matter is no longer dammed up in the body. The pallor gives place to healthy color and the heart beat is once more regular.

**Situations Wanted.**

Advertisements will be inserted under this head-  
ing at ONE CENT PER WORD each insertion, payable  
in advance. The address to be counted as part of  
the advertisement. No advertisement inserted for  
less than fifteen cents per insertion.

**WANTED** position as gardener. English, married,  
age 41, life experience in the culture of stove  
and greenhouse plants, forcing grapes, mush-  
rooms, etc., and the routine of flower and kitchen  
garden; excellent references. Apply Florist and  
Gardener, Post Office, Bridgeport, Conn.

**WANTED**—A position as head gardener or gen-  
eral superintendent on a large country estate,  
by a Scotchman, who has had 17 years' expe-  
rience in this country; 15 years in last situation; abili-  
ty and references cannot be questioned. Only  
those requiring the services of a first-class man need  
apply. Address Practical, care of American Gar-  
dening.

**FOR SALE.**

Advertisements not to exceed eighty words will  
be inserted under this heading at TWO CENTS PER  
WORD each insertion, payable in advance.  
The address will be charged as part of the advt.,  
and each initial, or a number, counts as one word.  
No cuts or display type allowed.

**HULSEBOSCH BROS.,** bulbs and plants, Engle-  
wood, N. J.

**GLASS** at wholesale, rock bottom prices. Also  
paint for greenhouses. The Red Glass & Paint  
Co., 456 W. Broadway, New York

**STRAWBERRIES.**—Layer plants for late fall set-  
ting. Eureka Raspberry plants for spring set-  
ting. Charles Nash, Three Rivers, Mich.

**L. C. BOBBINK,** Rutherford, N. J.—Dutch Bulbs,  
Clematis, Magnolias, Rhododendrons, Azaleas,  
etc. Branch of the Horticultural Company, Bos-  
koop, Holland.

**Business Cards.**

**O. D. Zimmerman,** Buffalo, N. Y. Horticulturist  
Landscape Gardener. Plans and estimates furnished

**LAND DEVELOPMENT,** consultations, plans,  
superintendence, plants, labor, etc., supplied for  
work as wanted. 500 original designs for residences,  
gardens, parks, etc., ready for inspection. Com-  
munications solicited from those who require the  
value of land or residence developed with practical  
economy. Jos. Forsyth Johnson, P. O. Box 1897,  
New York City

When ordering goods subscribers will  
confer a favor on the publishers by stating  
they saw the advertisement in **AMERI-  
CAN GARDENING.** We admit only re-  
sponsible business houses in our adver-  
tising columns. Avoid delay and disappoint-  
ment by giving name and address legibly.

**PRIVATE GARDENERS.****Appointments and Doings.**

Gardeners and others knowing of recent  
appointments and movings are requested to  
forward particulars of the same for publica-  
tion in this column. No charge is made.

W. Dowset is now in charge of Mr. F.  
C. Havemeyer's establishment at Roslyn,  
L. I.

Peter MacDonald, who for several years  
had charge of the famous collection of  
Phalenopsis belonging to Mr. G. Amsinck  
at Summit, N. J., and more recently was  
in charge of the floral department at Sie-  
gel-Cooper Co.'s great store, starts in  
business this week as a wholesale com-  
mission florist at 50 West Thirtieth  
street, New York City. Mr. MacDonald's  
long connection in the gardening com-  
munity has made him many friends, and  
doubtless they will now rally around him  
in a business way. He has taken into  
partnership a very active man who has  
had considerable experience in the cut  
flower trade. The firm name will be  
MacDonald & McManus.

J. Burns, in addition to having charge  
of Dr. Marcy's estate on the Orange  
Mountains, has been appointed to the  
supervision of the neighboring estate  
belonging to Mr. Douglass Robinson.

**Society of American Florists.**

As we go to press, the Convention at  
Providence, R. I., opens under very  
favorable auspices. The weather is all  
that can be desired, and the large atten-  
dance, while essentially a trade gather-  
ing, has a good sprinkling of gardeners,  
and representative men from various  
States are to be seen in the throng.

Trade exhibits are numerous and of  
good quality. Plants of various kinds  
are staged by Siebrecht & Son, New  
Rochelle, N. Y.; F. R. Pierson, Tarry-  
town, N. Y.; Pitcher & Manda, Short Hills,  
N. J., and Charles D. Ball, Holmesburg,  
Pa. H. A. Dreer, Philadelphia, Pa.,  
makes a great exhibition of Water Lilies  
in a tank. The Swan Point Cemetery  
(Mr. McCarthy, superintendent), makes  
a superb exhibit of coniferous plants.  
In the exhibition hall, R. Craig, Phila-  
delphia, Pa., makes a marvelous exhibit  
of highly-colored Crotons, and the high-  
est possible encomiums may be passed  
upon the display of Zonal Pelargoniums  
from the Cottage Gardens, Queens, L. I.,  
there are between thirty and forty vari-  
eties in this group. W. A. Manda makes  
an exhibit of fancy-leaved Caladiums.  
The F. R. Pierson Co. has the only ex-  
hibit of Dutch bulbs.

Novelties in plants are but few, and  
those of but mediocre quality. Nothing  
sensational.

Greenhouse heating and building is  
represented by Hitchings & Co., New  
York; A. T. Sterns, Boston; Plenty &  
Co., Jersey City; E. A. Ormsby, Melrose,  
Mass.; The Herendeen Co., Geneva, N. Y.;  
The Lockland Lumber Co., Lockland,  
Ohio; E. Hippard, Youngstown, Ohio;  
Smith & Thayer Co., Boston; John A.  
Scollay, Brooklyn, N. Y.

Among the prominent gardeners no-  
ticed are: S. Henshaw, New York; W. R.  
Smith, Washington, D. C.; A. MacLellan,  
Newport; A. Herrington, Madison, N. J.;  
J. Logan, Purchase, N. Y.; J. F. Sibson,  
Germantown, Pa.; Carl Blomberg, North  
Easton, Mass.; E. A. Roy Converse,  
Malden, Mass.; P. J. Donoghue, Lenox,  
Mass.; J. Lovelace, Lenox, Mass.; Max  
Krauss, Glen Island, N. Y., and G. Thom-  
son, Lenox, Mass.

Carl Blomberg makes a grand exhibit  
of Water Lilies, his best being sanzibar-  
ensis, eastoniensis, Robinsoniana. Lay-  
deker's varieties, and odorata carolin-  
iana.

A. MacLellan exhibits a beautiful plant  
of Lomaria blechnoides.

**Chicago, Ill.**

The commissioners of Lincoln Park  
have advertised and offer \$150 for plans  
for the laying out of a 20-acre park at  
Chicago avenue, from lands made from  
accretions from the lake.

The new palm houses at Washington  
Park are now glazed, the glass being  
ribbed inside, and the outer surface  
ground. Mr. Kants believes there is  
now no fear of burning, nor need of  
whitewashing, and yet abundance of  
light will be afforded. The plant house,  
covering a space of 125x140 feet, is also  
fast nearing completion. All will be  
heated with steam, and ventilated with  
the Evans ventilator.

**Madison, N. J.**

The regular monthly meeting of the  
Morris County Gardeners' and Florists'  
Society was held in Masonic Hall Wed-  
nesday, August 11, when thirteen new mem-  
bers were elected and two more pro-  
posed, two recent popular acquisitions to  
this society being H. A. Bunyard and J. E.  
Lager. A draft copy of the schedule for  
the fall show was read, and the president  
announced that it would be ready for dis-  
tribution in a few days. The essayist of  
the evening was Mr. Charles H. Totty,  
who read a short practical paper on the  
Chrysanthemum.

**Springfield, Mass. Sweet Pea Show.**

The annual Sweet Pea Exhibition of  
the Hampden County Horticultural So-  
ciety which had been postponed from the  
date originally fixed on account of the  
unusual rainfall, was held August 11 and  
12. The fine weather for a few days just  
previous brought out the flowers, in  
many instances in abundance and of fine  
quality. The majority of exhibitors are  
amateurs, and several entered for the  
Eckford Challenge Cup, which was  
awarded C. M. Hartzell of Holyoke. Mr.  
Hartzell also got the set of 21 books  
offered by W. Atlee Burpee & Co. Rev.  
Mr. Hutchins was unable to enter a  
single variety, his entire crop having been  
destroyed by the "blight."

The best local grower of Sweet Peas  
to-day is W. J. Eldred of West Spring-  
field. His flowers are superb; his 50 of  
Aurora were the wonder of all beholders.  
The flowers were of wonderful size, great  
substance, long and stiff stems. Mr. El-  
dred took twelve first prizes, three  
seconds, two thirds and a diploma. He  
also has several seedlings that promise  
well, beside the one to which the society  
granted a diploma.

Mrs. H. A. Jones of Worcester made a  
fine exhibit in several classes, her entry in  
class 1 would have taken first had the  
varieties been named, as demanded by  
the rules of the society; the failing of  
some exhibitors to comply with this ac-  
counts for the judges' rulings in several  
cases. Mrs. Jones' Royal Rose in class  
10 was a fine lot, also the vase of double  
flowering blossoms; her entry for largest  
blossoms was also Royal Rose.

E. A. Weeks of Worcester was a large  
exhibitor, entering in many classes, and  
taking his share of the prizes. Addison  
H. Smith of West Springfield made sev-  
eral fine exhibits, his Cupids being  
awarded the Burpee prize. F. A. Blake,  
of Rochdale sent his gardener with several  
entries of finely-grown flowers; his Red  
Riding Hood was well grown, and so  
were his 50 sprays each of twelve vari-  
eties. Mr. Blake also exhibited 30 vases  
with foliage which were very effective. E. C.  
Fenn of Ware was obliged to withdraw a  
number of his entries on account of a  
heavy rain that passed over his grounds  
the day before. Yet he took several first  
prizes, Katherine Tracy being one of his  
best efforts.

Mr. L. D. Robinson has been drowned  
out several times, therefore he could not  
make his customary display. He took  
first for 12 varieties, 50 sprays each;—  
they included Firefly, Venus, Mrs. Eckford,  
Blanche Burpee, Blushing Bride, Extra  
Early Blanche Ferry, Lottie Eckford, Mrs.  
Sankey, Apple Blossom, Emily Eckford.

Mr. George Smith, Manchester, Vt.,  
had several vases of Sweet Peas and  
other flowers. R. H. Houston and Mrs.  
Day Chadwick of Holyoke, Mrs. Dexter  
Snow of Chicopee, Mrs. H. S. Hyde of  
West Springfield, Mr. Shephard and H.  
Wilson Smith of Mittineague were also  
exhibitors of Sweet Peas.

The Botanic Gardens of Smith College, Northampton (L. J. Canning, gardener), made a most excellent showing of hardy flowers and exotics filling over 250 vases.

Mr. Alex. Parks of Northampton made a good showing of tuberous-rooted Begonias and Sweet Peas; Mr. Schlatter & Son a table of well-grown tuberous Begonias in pots, also Palms and Ferns, clean and healthy.

The following was the result of the competition for named varieties; we give only the names of the winning sorts:

Best white, Blanche Burpee first and second; Emily Henderson, third.

Best light pink, Katharine Tracy, first and third; Lovely, second. Lovely shown in a bunch is surely the handsomest sweet pea in the way of pinks; Katharine Tracy is fine, but its drawback lies in having only two flowers to a stem.

Best mauve, Celestial, first; Golden Gate, second; Dorothy Tennant, third.

Best red, Firefly, first; Cardinal, second and third.

Best variegated, Aurora, first; Senator, second; Purple Bronze Stripe, third. Coronet did not show up so well as Aurora; its stem is short, and Aurora bunches better.

Best new variety, not catalogued before 1897, Royal Rose, California, and Queen Victoria. In the order named. Royal Rose was in elegant shape.

Best ten stems with largest blossoms, Royal Rose, a mixed lot, and Senator.

## Roses Under Glass.

With the advent of August we most generally get very warm days and cool nights, and the days, too, become more perceptibly shorter, thus compelling us to reverse our methods of growing from Spring and early Summer to those of early Fall. Instead of syringing or watering the houses now early in the morning to keep them as cool as possible, and induce a more congenial growing atmosphere, we find it almost 9 A. M. before the sun begins to warm the houses up consistent with watering, or, in other words, we should not water until the day disperses the cool night atmosphere. From now on one daily watering and syringing, if the weather be fine, will be sufficient, unless we have an extremely hot spell, with a drying air, when a light syringing and damping down in the afternoon will be most beneficial. Of course, where houses have cement walks they should be wetted down more frequently than those with walks of ashes or such like material.

Speaking of cement walks for rose houses, I have been asked lately by young beginners if such walks were the most desirable. As these parties were going into the business to make money, and had but a very limited capital on hand, my advice to them was to invest their money in a good reliable ventilating apparatus rather than cement walks. While cement walks are very clean (when kept so), and pleasing to the eye, I, myself, prefer those composed of ashes, as they help keep a more uniform moisture in the houses. Especially is this the case when hard firing has to be done in Winter. One of the most necessary things in a rose house is a good ventilating machine; but how many devices do we see used to take its place, which are not only a nuisance, but in the course of a year the extra labor needed to work them adds up to more than the first cost of a good apparatus.

Don't overlook stirring or rubbing over with the hand the surface of the beds. Some soils are more liable to turn green and cake than others, and if this happens it takes quite a long time before the soil gets into proper condition again.

Last spring, in one of my notes, I mentioned the great benefits derived by syringing from different directions once in a while, such as from the narrow center walk which we see in a good many houses. This is one of the little items that should not be lost sight of now, as spraying will have to be greatly curtailed as the season advances, leaving a possible opening for red spider; so when we do syringe now, do it thoroughly by reaching every part of the plants. Cleanliness should be ob-

served at all times in our houses, by keeping all dead leaves and other rubbish that may accumulate, cleaned up; not only on the top of the tables, but underneath as well. Without this a pure sweet air, in which a rose delights to thrive, cannot be obtained.

It is no unusual occurrence for us to get some very cool nights toward the end of this month, sometimes more so than in the first half of September, the thermometer hanging around the 50° mark. On no account during these periods should the ventilators be closed, or the evil resulting will be greatly augmented. Instead, reduce the air to within 3 or 4 inches and run heat around one pipe. This will keep condensation out, and give a good circulation, which is very desirable. It does not seem long since I was harping on the same string, and, it is very true, our boilers do not get a very long rest. If any have neglected going over, cleaning and getting their heating apparatus into order, they should do the work at once. It often happens while building and repairing benches, that some of the coils of pipes get out of their original level, consequently the proper and easy circulation of either steam or hot water is seriously interfered with. H. H.

## How's This!

We offer One Hundred Dollars Reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

F. J. CHENEY & CO., Props., Toledo, O.

We the undersigned, have known F. J. Cheney for the last 15 years, and believe him perfectly honorable in all business transactions and financially able to carry out any obligation made by their firm.

## HENS AND EGGS

fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25**.

**POULTRY MONTHLY** is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend **Poultry Monthly** as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

## A WONDERFUL OFFER!

American Gardening (Weekly), \$1.00 } Both \$1.25  
Poultry Monthly, - - - 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.

Address **AMERICAN GARDENING**, P. O. Box 1697, New York City.

## WHOLESALE MARKETS.

### New York.

The cut flower business is in a most depressed condition and shipments are hardly clearing express charges. Asters are a glut and sell for \$1.25 to \$2.50 per 100 bunches. Gladioli are greatly in excess of requirements, consequently many go unsold; prices range from \$2 to \$5 per 1,000.

Fortunately, there is a better tone in the fruit and vegetable markets and stock is clearing up well. Buyers are not spending much time beating about, but buy straight away unless extreme fancy prices are asked; there is then, however, quite a kick.

Hothouse grapes remain as quoted last week.

Hothouse nectarines are swamped by the competition of Californian stock.

Messrs. Archdeacon & Co. are handling some fine hothouse figs and are realizing fairly well upon them. They come packed in small cups containing six fruits each, and sell at figures varying from 8c. to 5c. each, and are usually sold at dozen rates.

Southern peaches are nearly over. Shipments from Maryland and Delaware are large, the Jersey supply is increasing, and up-state peaches may be expected in quantities next week. Prices at present time are erratic, owing to a like condition of supply and quality.

Pears are in heavy supply, high quality Bartletts are moving in favor of the seller, and \$4 has been reached.

Fancy melons have improved in price, but quality is not of the best. The top notch figures reached for Jersey Gems and Jenny Linds is \$1.50 to \$1.75, Hackensacks \$2 to \$2.50 per barrel.

The potato market still remains steady with prices ruling from \$1.87 to \$2.25

per barrel; \$1.10 may be taken as the average top figure.

Apples—Alexander, hand-picked, per d.-h. barrel, \$2@2.50; Duchess of Oldenburg, hand-picked, d.-h. barrel, \$2@2.50; Gravenstein, hand-picked, per d.-h. barrel, \$2@2.50; Nyack Pippin, hand-picked, per d.-h. barrel, \$1.50@2; twenty ounce Pippin, hand-picked, d.-h. barrel, \$1.75@2; Codling, hand-picked, per d.-h. barrel, \$1.75@2; Orange Pippin, hand-picked, per d.-h. barrel, \$1.25@1.50; Astrachan, hand-picked, per d.-h. barrel, \$2@2.50; open heads, large fruit, hand-picked, barrel \$1.25; open heads, small and drops, 75c.@\$1.

Peaches—Missouri, fancy, per carrier, \$2.25; Maryland and Delaware, per carrier, \$1@1.75; Maryland and Delaware, extra yellow, per basket, \$1; Maryland and Delaware, extra red, per basket, \$1; Maryland and Delaware, prime, per basket, 70@80c.; Maryland and Delaware, common to fair, per basket, 40@60c.; Jersey, extra, per basket, 80@90c.; Jersey, prime, per basket, 60@70c.; Jersey, common to fair, per basket, 40@50c.; Jersey, culls, per basket, 25@30c.

Pears—Bartlett, Jersey, large, clean per barrel, \$2.75@3.25; Bartlett, Jersey, poor to fair per barrel, \$1.50@2.50; Bartlett, upriver, per barrel, \$1.50@2.50; Clapp's, upriver, per barrel, \$2@2.50; Clapp's, upriver, per keg, \$1@1.12; Bell, nearby, fair to prime, per barrel, \$1.50@1.75; other kinds, per barrel, \$1.25@1.75; common cooking, per barrel, \$1@1.50.

Grapes—Delaware, North Carolina, fancy, per 24-pound case, \$2@2.50; Delaware, North Carolina, common, per 24-pound case, 75c.@\$1.25; Niagara, North Carolina, fancy, per 24-pound case, \$1.50; Niagara, North Carolina, common, per 24-pound case, 75c.@\$1; Moore's Early, North Carolina, per 24-pound case, 75c.@\$1.25.

Plums—Damson, per quart, 4@5; Wild Goose, per quart, 4@5c.; Wild Goose, per

10-pound basket, 20@30c.; Botan, per quart, 5@8c.; Green, state, per 10-pound basket, 18@20c.

Blackberries—Fancy, large, per quart 7@8c.; small and ordinary, per quart, 4@6c.

Huckleberries—Shawangunk Mountains, per quart, 6@7c.; Pennsylvania, large, dry, per quart, 7c.; Pennsylvania, ordinary, per quart, 5@6c.; Jersey, per quart, 4@6c.

Watermelons—Watermelons, usual qualities, per car, \$75@1.75; watermelons, prime, per 100, \$12@14; watermelons, small to medium, per 100, \$6@10.

Muskmelons—Hackensack, Nutmeg, per barrel, \$2@2.50; Monmouth County, Nutmeg, per barrel, \$1; Monmouth Co., Jenny Lind, per barrel, \$1.25@1.75; south Jersey, Gem and J. Lind, fancy, per barrel, \$1.50; south Jersey, Gem and J. Lind, ordinary, 75c.@\$1.25; Maryland and Delaware, Gem and J. Lind, per carrier, 40@75c.; Baltimore, Cantaloupe, per barrel, 75c.@\$1; Baltimore, Gem and J. Lind, per basket, 35@40c.; Norfolk, Christina, per barrel, 75c.@\$1; Norfolk, Gem and Jenny Lind, per barrel, 60@75c.; Norfolk, ordinary kinds, per barrel, 50@75c.

Celery—Choice, large, per dozen, 35@40c.; fair to prime, per dozen, 20@30c.; small and poor, per dozen, 10@15c. Corn—Hackensack, per 100, \$1.50@2; other Jersey, per 100, \$1.25@1.75.

Cabbage—Jersey and Long Island, per 100, \$2@2.50.

Cucumbers—Jersey, per barrel, 50c.@\$1.25; per bushel box, 25@40c.; Long Island, per 100, 60@75c.; pickles, state, per 1,000, \$2@3; pickles, Long Island, per 1,000, \$1@2.25; pickles, Jersey, per 1,000, \$1@1.75.

Egg plants—Monmouth Co., Jersey, per barrel, \$1@1.25; south Jersey, per barrel, 90c.@\$1; per one-half barrel package, 50@65c.

Green peas—Western New York, per bag, 50c.@\$1.25.

NOW READY.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

This work will contain nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo. Price, \$1.50.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present increasing popularity of the Water Garden is largely due, is intended to serve as a **SOUND, PRACTICAL CULTURAL HANDBOOK** for amateur and professional alike.

The work should find a place in every library and in the home of all gentlemen interested in gardening; it will prove indispensable to the private gardener, whether he is at present cultivating an aquatic garden or with a view of preparing himself to take charge of one at any moment. It is scarcely necessary to dwell on the value of the book to the commercial man; every one in trade will require it.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A full descriptive list of Nymphæas and all other water plants, as well as of all trees, shrubs, etc., adapted for marginal effects, is included.

— ORDERS RECEIVED NOW. —

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

Lima beans—Jersey, Potato, per bag, \$2@2.50; flat, per bag, 75c.@\$1.25; southern, flat, one-half barrel basket, \$1@1.50.

Onions—Jersey, white, per barrel, \$2.50@3.50; other kinds, per barrel, \$1.50@1.75; Orange County, red, per bag, \$1@1.75; yellow, per bag, \$1.25@1.50; white, per bag, \$1.50@2.75; Long Island, yellow, per barrel, \$1.25@1.75; state and Pennsylvania, yellow per barrel, \$1.50@1.75; eastern, white, per barrel, \$3@3.50; eastern red, per barrel, \$2; Peppers—Jersey, per barrel, 75c.@\$1. Squash—Marrow, per barrel, crate, 75c.@\$1; Hubbard, per barrel, \$1.25@1.50; yellow crook-neck, per barrel, 50c.@\$1; white, per barrel crate, \$1@1.50. String beans—Long Island, per bag, 75c.; western New York, wax per bag, 60c.@\$1.

Tomatoes—Monmouth County, Acme, per box, 40@75c.; Monmouth Co., ordinary, per box, 25@40c.

Turnips—Russia, per barrel, 50@75c.

### Boston.

Watermelons still continue at a range of price from 12c. to 16c.; takes something fancy to bring 16c.; cantaloupes arrive in very poor condition, selling much lower than last week, 75c.@\$1.50 a crate; barrels same; Montreal melons selling slowly at lower prices.

No change in green corn; green peppers doing no better, \$1 a carrier; mushrooms, no change.

Elberta peaches selling \$2.50@3; stock very much better. This price is for six basket carrier. California stock, \$1@1.50.

Blueberries, very poor, selling 5@10c. a quart.

Celery, \$1.25@1.50; stock, extra fine; radishes same as last week, 10@20c. a dozen bunches. Beets, turnips, white flats and rutabagas are all dull.

No improvement in the summer squash market, but marrows are in good demand at \$2.25 a barrel.

Portland peas arriving in excellent condition, selling \$3@4 a barrel; string beans show no change; shell beans little lower, \$1.25.

Potato market is about \$2.50, quite firm; sweets worth \$2.25@2.50; some very fancy, \$2.75.

Cucumbers, \$1.50@2 a bushel; egg plant dull as usual.

Cauliflowers, very poor; demand for good ones fair; cabbage doing little better about 4@5c. each.

Illinois tomatoes, dull; about all gone for the season; hothouse stock, 5@10c. a pound; bushels, native home-grown, \$1@1.50.

New stock of parsnips selling 75c.@\$1 dozen bunches; carrots 3@5c. a bunch.

Onions doing no better from last week, selling 85c. a bushel.

Astrachan apples about out of the market; Gravensteins worth \$2.50@3 a barrel; Williams, \$3@4 a barrel; Pippins, \$2@2.50; Sweet Boughs all done; Orange Sweets selling \$2.25 a barrel. Some marks sell lower when quality is not so good.

Pineapples still continue coming in a limited way, selling at 40@50c. with good demand.

Parsley, dull at \$1.25 a bushel; mint, 35c. a dozen bunches.

Blackberries arriving in poor condition, selling 5@8c. a quart.

Clapp's Favorite pears selling \$1@1.50 a bushel, homegrown; Bartletts selling about the same as last week, \$1@1.50 a crate.

Little Gem melons, 50@75c. a basket; Jenny Linds about the same variety as Little Gems and selling at the same price.

Fair demand for grapes; eight basket carriers of Delawares selling \$1@1.75; Niagaras \$1@1.25; Concord, 12 basket carriers, \$1.50@1.75; five-pound baskets, 12@18c. each.

### Philadelphia.

The market has been very good during the past week. Shipments as a general thing have not been quite so heavy, but the market has cleaned up well on nearly every day; in fact, it was like old times

**P**RACTICAL painters everywhere use and recommend Pure White Lead (see list of brands which are genuine) and Pure Linseed Oil because they make not only the cheapest but by far the best paint. In fact you cannot afford to use anything else.

**FREE** By using National Lead Co.'s Pure White Lead Tinting Colors, any desired shade is readily obtained. Pamphlet giving valuable information and card showing samples of colors free; also cards showing pictures of twelve houses of different designs painted in various styles or combinations of shades forwarded upon application to those intending to paint.

*National Lead Co., 1 Broadway, New York.*

Mention American Gardening when you write.

to find the commission houses closing up by 1 to 2 P. M.

So far very few peaches are arriving; those coming in are from Maryland and are only fair to good, realizing from 80c. to \$1.50 per basket; no heavy shipments are looked for for ten days or two weeks. Dealers who have returned from the peach district of upper Maryland and upper New Jersey, report heavy crops in both these localities, but on account of the scarcity in Delaware, the market will be short for a week or so yet.

Tomatoes still continue to arrive in poor condition, owing to continued rains, and although many canneries are ready for work, they won't buy while the fruit is so watery.

Apples—Astrachan, hand-picked, per barrel, \$1@1.50; Jersey, hand-picked, per barrel, 75c.@\$1; Jersey, windfall, per barrel, 40@60c.; Maryland, per bushel box, 60@70c.

Pears—Bartlett, Jersey, per barrel, \$1.25@1.50; southern, per barrel, \$1.50@1.75.

Grapes—There have been several shipments from Maryland this past week,

mostly in 10-pound baskets which have sold at from 25@40c.

Plums—Table varieties per 8-pound baskets, 25@40c.

Blackberries—Are now about over; there were several lots of cultivated Jersey berries in from Jersey this past week, which sold from \$1.50@2 per crate.

Celery—Fair to good, per dozen, 35@50c.

Egg plant—Jersey, choice, per five-eighths basket, 75c.@\$1.25.

Lima beans—Jersey, per basket, 50@75c.; Maryland, per one-half barrel basket, \$1.50@2.50.

Onions—Maryland, white, one-half barrel basket, 80c.@\$1.25; Jersey, per barrel, \$2.50@3, per five-eighths basket, 50@75c.

Peppers—Jersey, per basket, 60@80c.

Squash—White, per barrel, 50@80c.; marrow, per barrel, 50@70c.

Tomatoes—Jersey, choice, 50@75c. per five-eighths basket; fair to good, 20@40c.; green, per basket, 5@10c.

Potatoes—Per five-eighths basket, 40@60c. per barrel, \$2.50@3.25 with the market firm.

## Catalogues . . . .

Will be issued in greater abundance this Fall than ever; every live firm issues one or more, wholesale or retail.

### Are You Planning Yours?

We would be pleased to furnish you with an estimate as to the expenses of printing same.

Our facilities are unexcelled; our staff familiar with the work; our presses of the finest; our prices reasonable and our product good.

### Printing of Every Description.

Cards, Billheads, Letterheads, Envelopes, Circulars, Price Lists, Pamphlets, &c., at lowest prices and best workmanship.

### Trade Marks, &c., Our Specialty.

We furnish illustrations of plants, flowers or designs, which may be copyrighted for your exclusive use, to serve as trade marks, symbols, &c., for use on all forms of printed matter.

## AGENTS WANTED.

Read this partial description of the best book of the kind for women which has ever been published, then write us for terms and territory.

## HOUSE PLANTS

AND  
HOW TO SUCCEED WITH THEM.

BY  
LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when noting with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to be far beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"HOUSE PLANTS" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "House Plants" will take its position second only to the much prized and everhandy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fail.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done if my instructions are followed."

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. Those silent monitors, the flowers, are not dumb, but speak to us through the delicacy of their scents, their intricate shapes, complex habits, and the glorious penciling of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

## ALL ABOUT THE HOME PLOT

POPULAR NOTES FOR THE SUCCESSFUL  
AMATEUR.

### Lilliums Harrisi and Longiflorum.

Virtually the same, some claim, while others insist that *Harrisi* is a marked improvement upon the other. *Ether* can be bought for ten cents and upward, according to size, and it is a little better to get strong bulbs, paying a slight advance over the lowest rates. It may be mere chance that the writer's experience has seemed to show *longiflorum* to be a trifle better for the window garden. It is well to procure the bulbs early, and to pot them carefully in a good compost, deep in the pot, so that the tops may be well covered, and yet leave room for filling in with rich earth for the benefit of the stem roots, to be made some time after growth starts. It is much better to use a fairly moist soil, and bury the pots in moist earth, so that there may be no need for saturation with water during the rooting period. But if the pots are heavily watered at first, they should be allowed to drain for a day before being buried. Excessive moisture causes rot; too little moisture hinders the free formation of roots, so necessary to strong flowering. It is the happy medium that brings success with *Lillies*; the medium in soil, in water, and also in heat. Sunshine, during the cool months, they will take in all available quantity.

### Keeping Plants in Show Condition.

Show condition means, of course, at the best or near it. Few, indeed, are the plants that can be kept in such condition all the year, and there are times with almost any plant, except, perhaps, those of the true decorative sort—when it is better out of sight. Midsummer and midwinter are the two most difficult portions of the year. Heat and drought frustrate our efforts after beauty during the summer; chills and over-watering and lack of air perform the same ill office in winter. Good attention and good conditions are both very necessary factors for keeping plants in good "condition."

### Color in Dracenas.

Perhaps no plant holds its color better than the *Dracena*, when we have had patience to wait for its final attainment. But conditions make a difference in the coloring of the plants, even after they have attained sufficient age to be well colored. A plant of *Dracena terminalis rosea* which has been throwing pure rose colored leaves for many months, is now, under the stimulus of stronger sunlight and a little bone meal, giving leaves of increased size, which in coloring are almost pure green.

### Bush Allamandas.

Two natural forms of these, viz., *A. Williamsii* and *A. nerifolia* have been already mentioned in these columns. Those who have a little more room may get more magnificent bloom by growing some of the climbing sorts in bush form. *A. Hendersonii*, with great yellow velvet flowers, showing bells three inches in diameter, does very well in bush form, though perhaps *A. grandiflora* is better. *Allamandas* will stand a great deal of sunshine, even under glass. They are heavy feeders, taking rich soil, plenty of root room, and rather frequent shifting. Toward autumn, water is to be withheld gradually, and during the last months of the year the plants may stand still, resting in a temperature of about 60 degrees. Very early in the following year they are to be cut back to good ripe wood and repotted. They make very satisfactory plants for those who are satisfied with summer bloom.

### New Rose Coronet.

For the present, at least, nothing in the Rose line has the attracting power of the hybrid tea. This seems to apply, both to the commercial grower and the amateur. The new American hybrid tea, known as *Coronet*, starts with several good points in its favor, aside from its own merits. Other things being equal, American sorts should have the inside

track, and the originators of this have hitherto put out a number of good and satisfactory things. The *Rose* is a cross between *Paul Neyron* and *Bon Silene*. It has been called the sweetest, and decidedly the largest and freest hybrid tea in cultivation. It is claimed to be also a strong, healthy grower, fine for the open ground, entirely hardy, beginning to bloom when but a few inches high, and continuously, and having great fragrance also. One fervid woman writer affirms that to her mind *Coronet* has reached the zenith of perfection, in pink hybrid tea *Roses*. When the same fervid writer adds that the "full, deep, and wonderfully double" flowers, when entirely open do not look unlike *Paeonies*, we are at a loss to know whether or not she has added to the merit of the *Rose* as instanced in the foregoing description.

### Seedling Freesias.

Some one says that *Freesia* seeds should be sown as soon as they are ripe, when in about a year's time they will be ready to pot for winter bloom. We have not yet found *Freesia* seed willing to germinate as soon as ripe. It is a very easy matter to grow and ripen one's own seed, hybridizing, if desirable. But in every instance that has as yet come to our knowledge, the seed refused to grow until it had been dry for two or three months. The *Freesia* seed bought last spring germinated quickly and freely, but the bulbs, grown outside, during the summer, have not as yet attained blooming size. Others, however, may have had better success.

### The New Bougainvillea.

Given a new plant, a woman ignorant, an introducer's description, and real often misplaced, what is the value of? Now "x," to our mind, is the unknown quantity representing results, and in a good many cases its value seems to be 0. Here is this dazling beautiful *Bougainvillea glabra Sanderiana*, which the introducer tells us is laden with bloom even in thumb-pots and produces its flowers in amazing profusion in the smallest pots, and under all conditions. We know an instance where the conditions are that a plant was bought in March, and has grown with reasonable thrift ever since. But the long wreathing sprays show only green, with no signs of the promised bloom. The question is now, whether by resting the plant slightly toward fall it can be thrown into bloom for early winter, or whether it is better to pinch the growths and thus get a broader foundation for another year. In any case, the introducer's dazling description fails utterly to tally with the behavior of the plant. What shall we think? What shall we do?

[This *Bougainvillea* will do all that the introducer has claimed for it; success or failure here, as in so many other instances, depends on the cultivator. *Bougainvilleas* can be made to flower by restricting the root space—in other words, ripen it and starve it.—Ed.]

### Potting up Carnations.

One of the best *Carnation* growers of the country suggest to window gardeners that they keep pinching the *Carnations* wanted for winter bloom, as the growths elongate, until early autumn. They are then to be transferred to the pots just before, instead of after, the crop of buds is set. If pushed thereafter in a sunny window, they will soon bud, and continue in bloom throughout the winter.

MYRA V. NORRIS.

Manhattan (Kansas) Horticultural Society held its July meeting at the home of Mr. William Baxter. After hearing the reports of standing committees, Mrs. R. H. Kimball read an interesting paper on "Kansas Gardening," which was followed by a lively discussion. Mr. Baxter's grounds were in very good condition, well filled with fruit and ornamental trees, shrubs and flowers, also small fruits. He has a wind-mill and tank and has irrigated his strawberries the past season, and they have yielded wonderfully well.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is an index of our subscribers' interest in the paper.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call to push circulation. Understanding thoroughly the value of the paper to every one interested in gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER

## PREMIUMS

## SUMMER

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us **AT LEAST** one new subscriber before the close of the season.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only seven new subscriptions at \$1.00 each.

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Beautifying Country Homes.** By J. WEIDEMANN. A handbook of landscape gardening. This is the most elegant and useful work on the subject ever issued in this country. It is beautifully illustrated with numerous fine wood engravings, and with 17 full-page and 7 double-page colored lithographs of places already improved. It contains general directions for lawns, roads and drives, walks, hedges, trees and shrubs, gardens, ornamental grounds, hints on burial lots, etc., etc. The beautifully colored plans of improved places are accompanied by descriptions giving the names and positions of the various trees and shrubs employed in planting, thus providing a complete planting map. Cloth, 4to. Reduced from \$15.00 to \$10.00.

*Given for 20 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse.) By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. Handsomely illustrated, cloth, 12mo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Canning and Preserving Fruits and Vegetables, and Preparing Fruit Pastes and Syrups.** By ERMERTINE YOUNG. This work gives a full account of the best methods by which the surplus fruits may well be saved for home use and for the large market demand, and a handsome profit accrues

to the home workers. A practical chapter on evaporation of fruits is embodied in the book. Paper, 20 cents.

*Given for 1 new subscription at \$1.00 each*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliot's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases, dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo., cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STRONG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit and Fruit Trees of America,** or the culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. By A. J. DOWNING. Second revision and correction, with large additions. By CHARLES DOWNING. This work has no equal in the country, and deserves a place in the library of every pomologist. It gives descriptions of all the finest varieties of fruit, native and foreign, cultivated in America, and contains the names and synonyms of over 10,000 varieties. Over 1100 pp., with several hundred outline engravings, including supplements. 8vo., cloth. \$5.00.

*Given for 12 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

# Potash.

Too little Potash in the fertilizer used produces a "scrubby" crop, just as a lack of sufficient grain fed

to stock means a "scrubby" animal.

## Free

An illustrated book which tells what Potash is, how it should be used, and how much Potash a well-balanced fertilizer should contain, is sent free to all applicants. Send your address.

GERMAN KALI WORKS, 93 Nassau St., New York.

Mention American Gardening when you write.

## "JADOO" FIBRE.

A New Potting Material.  
A Perfect Substitute for Earth.

Concentrated "Jadoo" Liquid. BOTH MEAT AND DRINK TO PLANTS.

Revives Drooping Plants, strengthens the weak and nourishes the strong; above all, it increases the size, causes greater profusion of bloom, and heightens the Color of all Flowers.

SIMPLY INVALUABLE IN POT CULTURE.

For Prices and Testimonials, Address **THE AMERICAN JADOO CO.**

813 Fairmount Avenue, PHILADELPHIA, PENN.

Mention American Gardening when you write.

## Diplomas and Certificates

HORTICULTURAL SOCIETIES,  
FOR FAIRS, INSTITUTES,  
GARDENERS' CLUBS, ETC.

These should be selected well in advance of the time needed, and secretaries of above should send now. The set of five, postpaid, \$1.00; money refunded on return of samples, or placed to credit of order, as directed. One single sample sent free on application if the writer will explain the exact purpose for which it is wanted.

**A. T. De La Mare Ptg. & Pub. Co., P.O. Box 1697, New York.**

HEADQUARTERS FOR ALL PRINTED SUPPLIES.

## LORD & BURNHAM CO.,

Horticultural Architects and Builders Steam and Hot Water Heating Engineers.

(Established 1856.)

Plans and estimates furnished on application for Greenhouses, Conservatories, and all kinds of Horticultural Buildings, erected complete with our patent iron construction; or for material only, ready for erection.

Largest Builders of Greenhouse Structures. Plans and construction embrace latest improvements. Six highest awards at the World's Fair.

Send four cents postage to New York office for latest catalogue.

## Fruit and Vegetable Growers Organize.

The fruit and vegetable raisers of the gulf coast have perfected an organization to assist them in marketing the products of their toil. They complain that in the past they have had considerable trouble in getting the products to market. They desire to ship to Northern and Eastern markets, but have found it unprofitable for a number of reasons: (1) good and bad products were packed together, and the good suffered; (2) shipments were so long in transit that the products perished; (3) freight rates were so high that the business would not bring a revenue, and (4) individual shipments could not have sufficient influence to bring about a reduction or fast service.

In May last, through the instrumentality of Captain B. F. Johnson of Arcadia, a meeting was held and the Gulf Coast Horticultural Association was organized. There had been a number of local organizations, but these were without strength to achieve the results desired, and Captain Johnson conceived the idea of organizing a monster association to include in its membership all the growers of the gulf coast. This organization was formed at a meeting at Alvin, Tex., May 29. Those eligible to membership are persons engaged in growing fruits and vegetables, not in any wise connected with commission or transportation companies.

The object of the association, as stated by the constitution, is "to consider all matters relating to the growing of fruits and vegetables, and the proper and best methods of cultivating, fertilizing, handling, and shipping to market." The organization was formed and a large number joined. The recent meeting was the second held, and there were a number of the local organizations which have been in existence represented, and joined the larger body. It is now the intention of the organization to confer with the railroads and secure by the combined influence of the entire population of growers a cheaper rate on their products; to secure a faster shipment to market, and in packing and loading the products to have a committee of two men present at each place to see that only good products are picked and that the packing and loading is properly done. There are, of course, selfish men who will, if not watched, put in the boxes decaying fruit or vegetables, and this is to the detriment of other products in the same car. It brings about a decaying condition in the car, and the presence of bad fruit or vegetables in the car at the terminus causes a low appraisal of the shipment, and there are instances where the shippers have not realized enough to pay the freight, and it has resulted in the shippers of good fruit paying for the shipment of another grower's bad product.

By organization this is to be prevented. By organization the products of all growers will be ready and sent to the same market by the same train, thus securing a special train of from six to twelve cars, being allowed a fast schedule and a cheap train rate. The inspectors will see that only good products go in the cars, and prevent a loss in this way.

The meeting held at League City, Tex., on August 7, was called to order by Captain Johnson, the president, the following officers being present: C. E. Hall, Webster, vice-president; W. E. Davis, Alvin, secretary, W. H. Stoughton, Webster, treasurer.

Routine business was disposed of, and a number admitted to membership. Secretary Davis then addressed the meeting. He had just returned from a trip to Kansas City and Chicago, where he accompanied a shipment of products, going via the Gulf, Colorado and Santa Fé Railway. He had learned much by the trip he had made, and he wanted to say that the growers must become acquainted with facts before they would be successful. In the first place, the shipment was not properly packed. The gulf coast produce is as good as can be had anywhere, but it is not properly packed. The ship-

ment was not a success because of the packing and because of the long time in transit, and the rate was too high to allow of a proper margin of profit even if it had reached its destination in first-class order.

R. T. Wheeler of Hitchcock made an earnest plea to the farmers to keep up an organization and secure for themselves those rights which other lines of business obtain by that method. Every industry and every interest has its organization except the farmer and the fruit grower of the coast country, and the prospects for a combination in that direction were good. He urged them to combine, and by the weight of organized influence secure those concessions from the transportation companies which are necessary to a profitable business.

P. H. Goodwin of the general freight department of the Gulf, Colorado and Santa Fé, was next introduced. Mr. Goodwin said he had no speech to make. He was simply present to show the interest of the Santa Fé Railroad in the farmers of the coast country, and if there are abuses, to learn what they are, so they can be corrected. He said good transportation is not the only necessity to make the business successful. Goods of the same character as those produced on the coast of Texas are brought from California, being in transit six or seven days, and are yet in good condition. He then said he would answer any question asked.

Mr. Stringfellow of Galveston—We must get better rates or go out of the business. Why is it the fruit industry is forced to 100 per cent. higher rates than the vegetable industry. One of the great industries of this country is that of the pear. If we are not able to market the crop it will be the worst blow this country has ever received.

Mr. Goodwin, in reply—I did not consider that I had come here for a discussion of rates. There are a thousand elements entering into the making of rates which cannot be explained here. It would require too much time. As I understand it, the growers want better transportation, not lower rates.

Mr. Goodwin continued, saying the rates from Louisiana to the same markets reached by Texas growers are higher than the Texas rates, and the growers of that state must find the business profitable, as they continue in it.

Mr. Stringfellow—Please explain why it is that the potato which sells for \$3 per barrel should have a 35-cent rate and the pear which has been selling at \$1 per barrel should be charged a rate of 85 cents. This was not answered.

Mr. Wheeler—Can you give any promise in the future of a cheaper rate and better transportation?

Mr. Goodwin—Better rates, no; better transportation, yes.

Mr. Stringfellow—Your road ought to do something for the growers. When I started my pear orchard here it was not getting anything out of this country, and now it is getting thousands of dollars annually.

Mr. Goodwin—The railroads cannot live without the support of the farming communities. We want your support if we can deserve it. We are neither of us here for our health. Unless we can get together in harmony, we can do no business together. If you cannot do business at the present rate it will be reduced to a point where you can do business, and we can furnish you transportation and each have a margin of profit.

Mr. Aubrey Maguire, travelling freight agent of the Missouri, Kansas and Texas Railway, who was then called on, urged the farmers to raise as much as they could. He said the companies can handle all that is to go to market, and the more there is the better the rate.

The grape crop in the Lake Keuka region will be one of the largest ever harvested. The Delaware is about two weeks behind other years, as is also the Catawba and Concord varieties. The Catawba grapes will be the largest ever harvested, providing the frosts do not come too early. It is generally believed that the price of grapes will be somewhat higher than of recent years.

## The Vegetable Garden.

**Mushrooms.**—Anyone desiring these for October, should now make preparations, by collecting fresh horse droppings and fixing on a suitable place in which to make the beds. Wherever the beds are made, whether in cellars or outbuildings, under greenhouse benches, or in properly constructed mushroom houses, the following considerations should be remembered:

Mushrooms will not grow unless the building is clean and sweet. It must be free from any draughts, and an even temperature of 55 to 60 degrees maintained. The place should not be infested with vermin, or they will burrow the beds, and as mushroom beds should always be made compact, nothing should be allowed to disturb them after spawning is done.

Wood-lice are very annoying in the vicinity of beds; the best way to destroy them that I have ever tried is by the use of a little sugar just colored with Paris green thoroughly mixed, and left in saucers near their habitations.

In the preparation of the manure, care is to be taken to use only fresh manure from healthy horses that are fed grain and hay only, any other cannot be depended upon for the successful growing of mushrooms. The manure should be protected from sun and rain, turned over frequently to sweeten and prevent fire fang; when half decayed, of a nice brown color, and neither dry nor wet, it is then in fine condition to make into beds. For further directions see former numbers of this paper.

**Potatoes.**—As soon as ripe, they should be dug and kept in an airy dry dark cellar, and looked over once a week to see if any are rotting. Potatoes will, after the unusual wet season we have experienced, rot badly. In many places the potato blight was prevalent, when such was the case, the tubers should not be kept for seed for another year, as the spores will be retained on the tubers all winter. Whenever potatoes rot badly, after having been dry, it is a good plan to sprinkle them with air slacked lime.

**Melons.**—This year the melons will be very watery and tasteless; if the ripest are picked daily, and placed on a dry shelf in the greenhouse, or wherever plenty of sun and air will reach them, for two days, before being taken to the house, they will be found to give better satisfaction than if used directly from the vines.

**Onions** will now be ripening; as soon as tops begin to die down, it is time to pull them up. This is rather wet weather to thoroughly dry them, and if rain continues, they should be taken under shelter, preferably where plenty of both sun and air can reach them, an unused greenhouse bench is admirable for the purpose. They must be well dried before storing them, otherwise they will not keep.

W. M. EDWARDS, Conn.

## The Canning Industry.

The Year Book gives the statement that the total value of canned fruits and vegetables in the United States in 1890 was nearly \$30,000,000, and adds: "The capital employed in this industry was only \$701,388 less than was employed in the creamery business, while the value of the products exceeded the combined value of all the windmills, clocks, watches, fire arms, mirrors, mats and matting, linen fabrics, and enameled goods manufactured in the United States that year."

The fruit prospects of Missouri for the year 1897 has been thus far a grand, good one and the fruit yet to ripen promises an abundant yield as well as profitable returns. Especially is this true of the apple crop for packing, writes L. A. Goodman, secretary of the Horticultural Society. Reports from nearly every county of the state give the crop ranging from 50 per cent. to 100 per cent., making an average of about 75 per cent. for the state. The grape crop will be so abundant that we cannot expect anything but low prices.

### Beautifying a Limited Area.

In the plan presented in fig. 171 is shown how a very small area of ground may be effectively developed along natural lines.

The fixed points which had to be considered were: the house was already constructed, the clothes-reel was placed, and the grape arbor planted. The house is on a bank some few feet above the roadway, hence the two entrances are not connected; if such communication be desired, steps should be made on the

south of the piazza. The lot adjoining the house on the south is reserved for future building, and so was not available in developing the land; it is for the present to be used as a vegetable garden in the rear, the front is put to grass and affords a pleasing prospect from the windows of the house; the detail can, of course, be altered to suit circumstances. The nine bushes shown here are intended to be *Rhododendrons*, which can be easily moved, no matter what their size when the new building goes up.

It is well in spaces of small area not to put a collection of different species, as can be done on a larger place. The same impression cannot be made by a host of miscellaneous shrubs as can be by using a sufficient quantity of one suitable thing. Some degree of grandeur will thus be had instead of the spottiness often seen.

The chief difficulty presented in this lot

is the placing of the shade trees which are an artistic adjunct to any house. Here they must be put on the extreme lines of the ground, eight *Limes* being suggested as shown (1). The smaller trees (2) are *Pinus larico* to give an evergreen effect, this species is selected as most suitable to the place, because its habit is not spreading but narrow. The terminus of the view on the south side is made by a *Silver Cut-leaf Birch*; this, being of a white color, will add distance to the view, a feature much to be desired. (3)

The general planting of the ground is to be done by hardy plants so that once done it is done for ever, and beyond a little annual care and attention nothing is needed.

The back border could be very effective if made of *Rosa rugosa* (red and white varieties) mixed with *Sweetbrier*. A few rough growing herbaceous plants, such as *Sunflowers*, could be interspersed to give color in late summer and fall. The bushes marked 4 could be *Deutzia crenata*, tall growing plants, very valuable to block out the rear of the building; they will grow almost anywhere.

The three beds on the south side and close to the house are in a warm situation; they can well be devoted to *China Roses*, which will afford flower throughout the entire summer and can easily be given a slight protection in winter.

On the other side of the walk are four

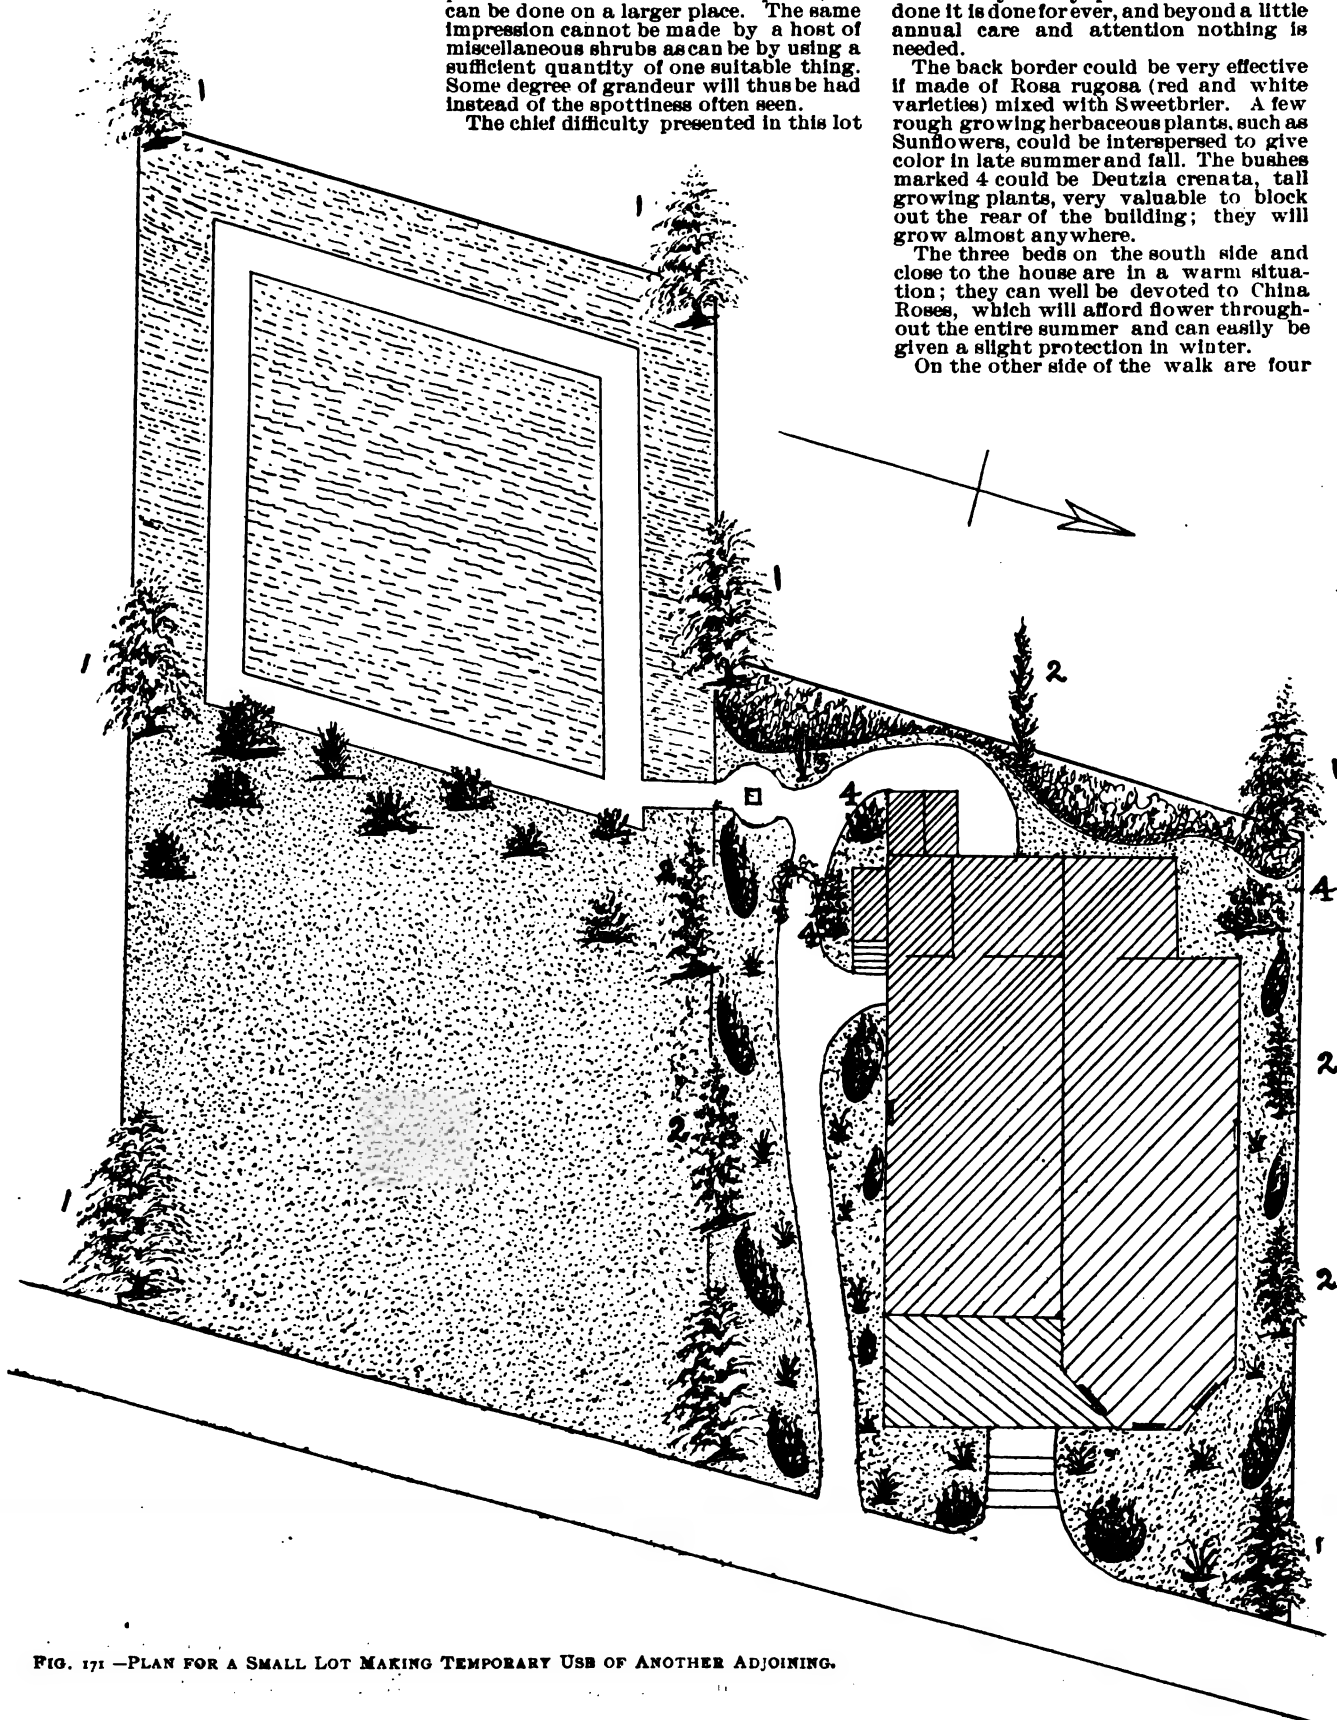

FIG. 171.—PLAN FOR A SMALL LOT MAKING TEMPORARY USE OF ANOTHER ADJOINING.

beds; that at the back can be put to hybrid perpetual Roses, as when out of flower the bushes would not here be obtrusive; the two middle beds here are one each for Lilies and Perennial Phlox; the bed to the front should be put to evergreens to give a continuous effect; creeping or dwarf Juniper could be used. Somewhat similar treatment should be afforded to each of the two beds in the front of the house; these should have a certain tone and distinctness, such as could be obtained by planting Golden Creeping Juniper, two feet apart, in a carpet of *Daphne cneorum* over all the bed. This effect would be very striking and original.

On the north side the three beds shown could be allotted to Ferns, and two specimen Ferns could be utilized on the grass. The six specimens on the front plot of grass could be *Yucca filamentosa*, evergreen, and very striking when in flower, moreover, they give no trouble in cultivation. The seven specimen plants on the long view must be all one thing, *Eulalia gracillima* suggesting itself as pre-eminently suitable. The space at command is not large enough for a mixed planting.

For spring effect all the beds should be edged with *Crocus*, one color to each bed; *Scilla siberica*, however, to be planted on the evergreen beds, it is so very graceful. Snowdrops, too, should be lavishly planted in every bed.

### Variety Tests on Forcing Tomatoes.

For the purpose of this test, I selected eight varieties, in order, if possible, to arrive at some conclusion as to which was the best variety for indoor forcing, and planted eight plants of each, growing them to one stem in the same manner as is adopted in the greenhouse for winter forcing.

The seed was sown March 1; March 15 the plants were removed into 2-inch pots; April 1 they were ready for another shift, when they were given 4-inch pots; and April 21 they were put into 6-inch pots; and the final shift was on May 18. This time they were put into fruiting quarters which consisted of wooden boxes 12 inches wide and 10 inches deep, placing them at the foot of a south wall.

The following list shows the results as to weight, etc., from first of picking to Aug. 15. The weather proved unfavorable, being cold and wet, had it been different, the set of fruit would undoubtedly have been better.

The conclusion arrived at after the test is this; that this coming winter I shall grow Sutton's Best of All as the main crop; some Conference, and a few plants of the yellow variety, Prince of Wales.

NAME	FIRST PICKING	NO OF FRUITS	WEIGHT
Earliest of All.....	June 28	174	84 lbs.
Conference.....	July 1	158	30 "
Best of All.....	July 5	162	38 "
Prince of Wales.....	July 1	188	26 "
Peachblow.....	July 12	178	36 "
Tender and True.....	July 12	166	35 "
Lorillard.....	July 12	91	18 "
Aristocrat.....	July 8	110	25 "

Earliest of All is a weak grower, very subject to mildew and the fruit, though of good flavor, is very uneven and corrugated; very early.

Conference resembles Best of All, but the plant grows taller and is longer jointed.

Best of All I have found to be all that its name implies; it is A 1 in color, form, and flavor; very productive.

Prince of Wales is a small round yellow tomato of excellent flavor and a good cropper.

Peach blow.—Heavy cropper and of good flavor; but soft and would be almost useless for shipping.

Tender and True is a soft fruit, of good flavor, but so subject to mildew that I cannot recommend it.

All the foregoing varieties are from England.

Lorillard, though claimed by many growers to be one of the best, is too tall and long-jointed for me. It does not pay, and I will not grow it again.

Aristocrat is very productive, but for winter forcing the foliage is too heavy, necessitating the cutting away of much of it to insure the setting of the fruit; it is also very subject to spot or fungus.

WM. ANDERSON.

### A Year's Progress in Rose Growing.

Since the last essay on the rose by Mr. Isaac Kennedy of Philadelphia, which was read at Pittsburgh, Pa., new and valuable additions have been made to the rose family, both for indoor forcing and hardy garden varieties.

In the hybrid teas we are getting a new class or race of practically ever-blooming roses, a great boon to all lovers of the Queen of Flowers.

We have also added to the list of hybrid perpetuals which I shall refer to later.

In 1895 a new variety of the hardy hybrid tea was disseminated by Messrs. Pernet-Ducher of France, named the Souvenir du President Carnot. It is a seedling from Lady Mary Fitzwilliam, and that is all we know about it so far as parentage is concerned. Last Fall it was exhibited at several exhibitions and received many certificates of merit, silver medals, etc. It created a great sensation when sent out as being a grand forcing rose, a good grower and superb flower. It produces a long bud, large and full, color rosy flesh, shaded white at edges of petals. It certainly is a valuable addition to our hardy, ever-blooming varieties, and may prove an excellent variety for forcing, by further trial, although some are in doubt.

We have also Maman Cochet, one of the best and hardest in its class. Color carmine, mingled with salmon-yellow, large and full, superb. A grand garden rose.

Another valuable variety is Madame Abele Chatenay, sent out by Pernet-Ducher, which blooms constantly, bud fine, opening spirally; flowers full; color carmine-rose, shaded with salmon.

In addition to the above-named varieties, we have Caroline Testout, which has practically displaced La France. Kaiserin Augusta Victoria, an excellent variety for forcing, or as a garden rose; a beautiful primrose color; raised by Peter Lambert of Germany.

Now, Mr. President, I come to the most pleasant part of this subject, a year's progress in roses.

Real progress! By that I mean new and improved varieties of American origin, of which Mr. John Cook of Baltimore, Md., has added one to the above list, Mrs. Robert Garrett, which has received flattering notice in Baltimore notes in the American Florist. It is a most lovely flower; soft pink color, flowers large, foliage fine. It is said to be a grand forcing rose, and bids fair to lead all the pink varieties. From its parentage, Sombreuil and Caroline Testout, it should be an acquisition to the hardy teas. Mr. Cook is the originator of Souvenir de Wootton, Marion Dingee, and other good roses.

Extract from Baltimore letter in American Florist, page 803, issue of March 27, 1897, says:

"The exhibit of Mr. John Cook was a departure from the rest, as it was a vase of roses, but such roses! They towered above the carnations on strong stems clothed with heavy foliage, and were as large as American Beauties, but of a beautiful clear pink, almost light enough to be called a shell pink. The name is Mrs. Robert Garrett, and it will get a first-class certificate, the chairman of the committee saying that it is conceded to be the finest rose ever raised in this country. It is a cross between Sombreuil and Mme. C. Testout, and forms a valuable addition to the class of large roses, which is represented almost entirely by American Beauty, and which will probably supplant the small flowered ones, as has happened in the chrysanthemum, and is happening in the carnation."

There is also a new white hybrid tea, Lillian Nordica, a seedling from that grand rose Margaret Dickson by Madame Hoste. In color it is pure white, long buds, large flower of good substance, on long stiff stems, forces well, has dark rich foliage, and is very fragrant. At the

Boston Rose Show last June, it received the society's silver medal, and in June, 1898, a first-class certificate of merit. It is considered a valuable addition to the hardy, ever-blooming varieties of American origin.

The above-named varieties I consider improvements on existing varieties, and in the line of progression, but, we must not be content to rest here, we must strive to add to the above list. The improvements to be effected in the above list are:

To obtain new reds, maroons, and creams, possessing vigor, freedom of blood, and hardiness. Then this race of roses will be universally admired as garden roses, growing in ordinary soils.

We have a large and unlimited field in which to experiment and improve. The art of hybridization is simple; so easy and responsive, we should all make an effort to improve and continue in the good work, for there is no limit to the improvements in the several classes or families of roses.

In the hybrid perpetual class, a new rose has been sent out last spring by the well-known firm of Messrs. Peter Henderson & Co., New York. It is named the Jubilee. It was awarded the Massachusetts Horticultural Society's gold medal in 1895, the highest award in the gift of the society, and I am informed the first gold medal ever awarded a rose of American origin in this country. It was awarded a first-class certificate in 1893. It is from Prince Camille de Rohan by Louis van Houtte, and is one of the most vigorous growers on its own roots.

It had been exhibited three years in succession at the Massachusetts Horticultural Society when the committee decided to inspect it growing in the ground, which they did. The following is a copy of their award:

"Dear Sir:—Since the visit of the committee on flowers of the Massachusetts Horticultural Society to Wood's Holl, and inspection of your seedling rose Jubilee, they have discussed the merits of the variety, and are unanimous in pronouncing it the finest American-raised rose that is known to them, and the equal of any European rose of its class. Its magnificent color, united with a beautiful form, large size, and grand foliage and vigorous habit, they believe make it of great value and worthy of the highest award given by the society.

"We therefore award you the society's gold medal.

"(Signed) A. H. Fewkes, chairman."

Mr. F. Schuyler Matthews, the artist, and leading expert on colors in this country, says: "I have never seen a rose of such intense and dark color. The rose contains the darkest color combined with pure color of which nature is capable."

In hybrid perpetual roses, Mrs. R. G. Sharman Crawford is the best of all the light-colored varieties. Clio is a grand flower, also Helen Keller. Mavourneen, one of Messrs. Alex. Dickson & Sons' productions of 1895, is valuable as a climber or a cut-back; color a delicate silvery flesh-white, shaded rose at base of petals which are of excellent shape and substance. Marchioness of Devonshire is a grand rose of a beautiful satin-pink color. There is also in commerce in this country, a hybrid tea, Clara Watson, raised by Mr. Prince in England in 1894. Described as a salmon-tinted pink, and a good rose.

Of the hybrid polyanthas, Marie Faive is by far the best of all, blooming freely through the season, and is valuable for florists' work, producing good clusters of good-sized pure white flowers.

I am pleased to note improvements by hybridizing in the Wichuriana class. The credit is due to Mr. Manda of New Jersey, who has raised some valuable additions to this class.

It is gratifying to note progress in the past year, and if we would continue to advance in the future, we must interest ourselves in the raising of roses suitable for our climate in the garden, as well as varieties for the florist in the rose house. It is sometimes said our life is too short to wait to raise roses, but it proves long enough to wait to see others raise them.

\*Paper by M. H. Walsh, Woods Holl, Mass., before the Society of American Florists.

## Destructive Insects and Methods for Controlling Them.—IX.

PROF. W. G. JOHNSON.

### The Fruit Bark Beetle.

This insect is a newcomer in the United States, having been known in this country less than 25 years. In Germany it has been known to seriously injure fruit trees for over fifty years. It was first discovered on American soil in 1877 in an orchard near Elmira, New York, and has gradually spread, especially to the south and central west. It was observed in large numbers in orchards in South Carolina in 1885-86. Two years later it was found in Indiana and is now well established throughout the central Mississippi valley.

My attention has been called to it several times this season in Maryland, and the Editor of this journal has referred a query from a subscriber regarding the same pest. I have observed it lately in several orchards and some nurseries. It rarely ever does serious injury in nurseries and attacks only trees whose vitality has been reduced by being broken by plowing or injured in some other way. It does not confine its attacks to fruit trees, but is found working on shade and ornamental trees as well; usually the Maple, Elm, and Mountain Ash.

The beetle will attack perfectly healthy trees, but has a decided preference for weak and sickly ones. A tree infested with this insect can be easily detected by a little careful observation. The trunk and larger branches are usually peppered full of little round holes about the size of a pin-head, see fig. 172. In many instances the gummy exudation from these punctures is very conspicuous, standing out in bead-like masses or running down the branches and trunk. I have seen many trees, especially cherry, in this condition, the present season.

The little beetle responsible for this mischief is about one-tenth of an inch in length and one-third as wide. It is nearly black in color, somewhat cylindrical in general form, and under a glass of moderate power, shows a clothing of yellowish hairs on the head and wing covers. The head is vertical and the jaws are short and stout. The beetle is shown in our figure very much enlarged (after Forbes).

The adult beetle, after making a hole in the tree, deposits her eggs in little grooves made in the inner bark. The young that hatch from these eggs feed upon the inner bark and sapwood, making long channels running in all directions from the central groove, as shown in lower right corner. These young worms frequently become so numerous as to completely girdle the branch or trunk, as the case may be. The young have no feet, and are white, with small brown heads of the general shape shown in the illustration. They transform in these channels, and in due time the adults eat their way out, thus making more openings similar to the ones made by the female when depositing her eggs. There are probably two broods each year. One brood deposits its eggs in September and the insect passes the winter as larvæ or worms under the bark. These transform in the spring, and begin to emerge as adults as early as the middle of March. I have also found full-grown larvæ the last of July.

#### Remedies.

The fact that the fall brood passes the winter in the larval state, the first remedy that suggests itself is the cutting down and destruction by burning of all infected trees during the winter. I would recommend this procedure only in extreme cases or where the trees are of no special value. An attempt of extermination would mean the absolute destruction of every tree showing the least attack.

Experimentation with various sprays and washes for controlling this pest has not been carried forward very rapidly. Trees sprayed with a strong solution of Bordeaux mixture and Paris green combined, at about double the strength which is generally used, have given very promising results. The first

application should be made about April 1 and the second two weeks later. In order to be most effectual, the spraying should be done before any of the characteristic marks of the insect are found upon the trees, as it will be much easier to prevent the attack than to destroy the beetles after they have once entered the tree.

### Chrysanthemums.

**Mulching at this season.**—A good mulch of cow manure on pots and benches will be found very beneficial. It is surprising how soon the manure brings the roots up to the surface where they get more benefit from the feeding with manure water.

**Nitrate of soda.**—If some of the plants are looking pale and sickly a dose or two of this—just a little—say about an ounce in a four-gallon can of water will soon bring back the color.

**Buds.**—Take these now as they appear; the plants should be looked over every day to catch the bud in its earliest stage. We believe in the crown bud, as we think

FIG. 172.—THE FRUIT BARK BEETLE AND ITS WORK.

much of the trouble from weak neck is the result of taking the terminal. The plants have an extra growth to ripen, and when they are not kept cool enough to allow it to do so, the stem is weak, the flower flops over, and the grower finds, in the language of the politician, that "it is a condition and not a theory that confronts him."

**Exhibition schedules** that bar out flowers having artificial support are on the right track. It seems ridiculous to me to see a bloom held up by a wire or piece of cane. I like a flower to hold its head up, no matter in what company it may be, then the admirer realizes to the full why the Chrysanthemum is called the Queen of the fall. In real life a queen that cannot hold her head erect does not amount to much.

**Plants in the open ground**, which it is proposed to house, should be cut around with a spade a few days before lifting. The transfer will not then give quite such a check to them. They cannot be taken up too carefully as the object should be to retain the foliage.

**Sprays.**—For this work plants should not be disbudded, but just left to develop all the flowers they will. They will be small blooms certainly, but are a pleasing change from the big ones. Single varieties and all the smaller flowered types are good for this work.

C. TOTTY, N. J.

### Roses in Jadoo.

My experience in growing Roses in Jadoo is an accidental one. I came across a leaflet of Jadoo in the autumn of last year, and, having to stock a new conservatory, I thought I would try it on various plants, bulbs, weeds, and cuttings, so I had one large sack as a sample. I liked the handling of it, and as the plants both in the grounds and the conservatory seemed to pick up a healthy look quickly, I sent for several other sacks, with the result that I do not care to use anything else now, and everyone who has seen my conservatory and has one of his own, complains that his plants are not nearly so healthy, and goes away with a firm determination to try Jadoo.

My experience of Rose growing in it came about through a nurseryman sending me some pot Roses, along with a large consignment of other Roses for outside planting. As these pot Roses had buds upon them, I put them into the conservatory to see if they would open. They were *Perle des Jardins*, *Homer*, *The Bride*, and *Sunset*. There was also two climbers for planting outside and taking the stems through the wall to train in the conservatory. As the buds on the above four plants did not open—because the check given them in their carriage had been too great—and the foliage dying down, I thought I would report them in Jadoo. This I did, cutting them down at the same time. It was not long before the shoot buds began to form and send forth beautiful dark-colored foliage, with stems strong and healthy, having lovely flowers. The growth between leaf and leaf was from three to four and even five inches in length, but as I have only now had the curiosity to measure, some may even have been more.

*Homer* was a most graceful plant; it sent out a shoot from the stem near the soil which I allowed to grow from curiosity, and it grew over three feet in height, ending with a clump of eight blooms. This plant I had in my sitting room for months, but I fancy the electric light forced it too much.

As the blooms went off I cut back again and had a second crop of Roses, and when these were done I cut them back again the third time, and have now new shoots six and seven inches long with flower buds forming. My success would have been greater had not the *Marchal Niel* climber developed mildew, and all the other Rose trees caught it, and it became one perpetual fight to keep it down. I have now turned all the four Roses outside in the border and cut back the climbers.—*Amateur Gardening* (England).

The nurserymen of Danville, N. Y., have united to make war upon the woodchuck. The ten cents bounty heretofore offered for dead woodchucks, while furnishing an active pursuit for a few vagabond hunters, has utterly failed in the grand desideratum sought to be accomplished—the extermination of the pest. Hereafter poisoning will be the tactics.

The Anniston (Ala.) Homestead and Fruit Growers' Association is a corporation with a capital of \$150,000, and controls 8,500 acres of land from which trees have been cut for charcoal. It purposes to operate fruit orchards for non-residents.

The great McNair fruit farm, which consists of 2,036 acres, is located at St. Elmo, near Thayer, Mo. The start was made in June, 1893. One hundred and fifty men were put to work clearing the ground and preparing it for fruit-tree planting. By January 1, 1894, 36,400 trees had been set out. Six hundred and eighty acres will be planted in peaches this fall. On his premises he already has 20,400 Elberta peach trees three years old. There are 20,000 apple and 3,000 peach trees already planted on the farm. By far the most interesting sight on this great fruit farm is a herd of fourteen buffalo. There is only one other herd on the continent. Most of the fruit grown on the farm is marketed in the East and England.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY  
A. T. DELAMARE PTO. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.  
REGISTERED CABLE ADDRESS  
Commercial Cable Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issues. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line, in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

**The Florists and the Others.** THE Thirteenth Annual Convention of the Society of American Florists passed into history, Friday, August 20, after a three days' session, and the fourth given up entirely to pleasure.

It is easy to review the proceedings in their entirety. In the first place then, it is in order to say that attendance was fully equal to that of any previous convention. And the zeal and activity manifested by the delegates proved that the society is very much alive. It was evident all the way through that the business proper of the society was being jealously guarded by young members, and the election for president further proved that youth was in the ascendant, the president-elect W. F. Gude being under thirty years of age. This result very plainly demonstrated good fellowship does not suffice to carry an election; indeed, this very fact, combined with the

desire to have one of themselves, won the day for the Washington florist.

To the readers of American Gardening this will be satisfactory news, for in past years they have stood aloof from the Society of American Florists, owing to the fact that the so-called social element was reputed to predominate, and the meetings generally balanced up in favor of pleasure rather than profit.

The change of name to include "Ornamental Horticulturists" is of great importance to our readers, for it at once brings a large number of them into direct communion with the organization. Hitherto under the name of Society of American Florists, a class distinction was raised which made it appear simply as a gathering of traders and growers of bulbs, plants, and flowers, together with the necessary attendant florists' supplies and implements. The all-around horticulturist was left severely alone. Now, however, under the change of name there is a chance of greater things.

Although the title itself is the reverse of elegant, still it is ample for the purpose of opening the doors for admission to others than traders pure and simple, giving the professional and private gardener, his employer, and better still, the interested amateur, an opportunity to enter.

Now that there is really a substantial national society properly organized with machinery of operation in full swing, the gardener is given a chance to take his position, and we hope that all concerned will take advantage of the invitation and present a united front.

At the same time it may be well at this juncture to remind the powers that be that if their intentions be in accord with the new title, there should be some representation of "ornamental horticulturists" on the next executive committee. Doubtless certain well-intentioned present members allowed their enthusiasm to run away with their judgment when they made disparaging remarks concerning the raising of certain garden crops. If those men know anything at all, they know well that a gardener to be worthy of the name must be able to grow cabbages and to produce them in perfection, both in season and out of season.

**English Varieties.** SOME few months ago an interesting correspondence appeared in our columns regarding English potatoes in America when Mr. H. Pugh of Manitou, Man., had a good word for Myatt's Ashleaf with him. We entered into the arguments and pointed out that the general experience of skilled cultivators was not in favor of the foreign-raised varieties. The conditions of the present year have been remarkably unlike those of ordinary years and if English potatoes will ever do well in America they should have done so this year.

And such indeed has been the case; samples of tubers, chiefly Myatt's Ashleaf, have been submitted by readers and have come through the tests with fairly satisfactory results, but generally the potato had not its true clean flavor.

Mr. Pugh has lately sent samples from his patch, which we were glad to find were of very excellent quality, far superior to any of the same variety grown in the states so far as our experience goes.

The communication appears in another column.

It is a very noteworthy fact that the tomato does not seem to follow the climatic peculiarities of the potato, several English-raised varieties having out-classed some of the native standards as is set forth elsewhere in this issue. This is not the first time that we have had occasion to remark upon this same fact, and our own conclusions that Best of All is really the leader as a forcing tomato are based on careful observations for some time past.

## Disease of China Asters.

We have recently been in almost daily receipt of specimens of China Asters which the senders say have been growing along vigorously, when all of a sudden a collapse takes place. Last year the same trouble was reported to us at this same season, but from all appearances the disease is more widely spread now.

A fungus is the cause and it works in rather a curious way. Usually the plant is attacked near the base of the stem or in the upper portion of the roots; here the fungus gains entrance and soon reaches the vessels which supply the plant with water. These vessels are soon clogged up with the parasite, and as a result the leaves wilt and the plant gradually succumbs.

A similar fungus attacks cotton, water-melons, cabbages, and other plants, causing them to wilt and die, in much the same way as the Asters.

So far as we are aware there is no known remedy for the disease.

The very wet weather that has prevailed has been very favorable to the development of the fungus, and so to a large degree, the untoward season must be held responsible for the present outbreak.

Prof. Galloway of the United States Department of Agriculture, last year wrote in our columns as follows:

"We think it would be advisable to keep the base of the stalks exposed. It is possible that after the diseased plants have been removed and destroyed, the ground cultivated, and the bases of the stems cleared to the top of the roots, that a thorough coating of this portion of the plants with Bordeaux mixture (50 gallon formula) might prevent them from becoming infected. This remedy, however, has not been tried and is simply offered as a suggestion to those who desire to experiment. To any grower who desires to make an experiment, we would suggest that he leave one block of Asters untreated and treat the others in accordance with the suggestions made."

Have any readers profited by the suggestion?

## Peach Crop Estimate.

The following is taken from a circular letter issued by W. N. Britton & Co. of Rochester, N. Y.:

"From correspondence with over 100 dealers, who have personally investigated the growing crop, we make the following estimate: Connecticut 300,000 against a comparative failure last year; New York, 2,000,000, against a failure last year; New Jersey, 3,000,000, against 1,200,000 last year; Pennsylvania, 500,000 against a comparative failure last year; Delaware, 500,000, against 3,000,000 last year; Maryland, 500,000, against 4,000,000 last year; Georgia, 200,000, against 1,500,000 last year; Michigan, 200,000, against 2,000,000 last year; Ohio, 400,000, against 200,000 last year; Arkansas, 3,000,000, against 1,000,000 last year. The above is based on one-half bushel baskets, and shows a total of 10,600,000 against 13,900,000 last year.

Some of western New York growers complain that these figures are low, especially for their own crops.

The Georgia State Horticultural Society is urging the appointment of a state entomologist.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Crops in Washington.**—In looking over your valuable paper, in which I take much pleasure, I find a statement that the Washington peach crop was never better. Let me say that there is no crop. Peaches are almost a total failure this year, and the trees are dying yet from damage done by the frost of November, 1896, and thousands of acres of our orchards are ruined, so many of the trees are half dead and half alive that as long as our present orchards stand they will be made up of cripples, chiefly apples and cherries. But few people realize the damage done. The apple and prune crops are moderate.—GEO. HARDS.

**Myatt's Ashleaf Potatoes.**—I send you herewith six Myatt's Ashleaf just taken up, and if they arrive in good condition I shall be very pleased if you will kindly give them a trial on your table, when I think you will be assured that they possess all the good qualities that I claimed for them. This year the tubers are small in size, but I have counted as many as 25 from one set. I shall be glad to mail to any of my co-subscribers, at regular seed potato price, next month, a limited quantity. Of course the tubers will be sent whole. I also send a photograph of my potato patch and I think you will agree with all who have seen it that it is a grand showing. We grow Carman Nos. 1 and 3 and Pearce's Extra Early which was in full bloom July 27; the other varieties are not sufficiently shown. I am sorry that I did not have a basket of tubers in the photo to show their grand size.—H. PUGH, Manitou, Man.

(See page 602.—Ed.)

**Tomatoes Wanted.**—Will some one please inform me where I can procure Nicholson Hybrid and Eclipse tomatoes. I have tried several of the leading seed stores and cannot get them. I believe they are highly recommended for forcing under glass.—J. C. (See report of tests on page 600.)

**Blue Hydrangeas.**—Can any readers of American Gardening inform me through the columns of that paper how to obtain blue or purple Hydrangeas. I have heard of iron filings being used, but in what quantity.—DAGO.

—We confess we do not see the advisability of tampering with the color of the flowers. It is said that iron produces the blue color, but we have no knowledge of the subject. Iron is present in all soils, but we have noticed that plants on soils specially ferruginous have had blue flowers. Can some readers enlighten our correspondent?

**Wireworms on Carnations.**—What remedy shall I use to destroy wireworms working on roots of Carnations growing outside? The worm is small, dark, about one-half inch long, when disturbed moves quickly, sometimes throws itself in a circle. I have lost several plants, and upon examination find these worms working on the roots. I trust this description will be sufficiently lucid for some one to recognize, and so advise me as to a course of procedure.—F. S. CLARK, Cal.

When the people of Jamaica, L. I., ordered the lowering of sidewalks, extensive preparations for saving the trees were entered into. The Large Tree Company of Brooklyn made a proposition to the board offering to lower the trees at a price ranging from \$5 to \$18, according to the diameter of the tree. The work of lowering the trees will soon be begun.

The Massachusetts Fruit Growers' Association will have its fall meeting and field day in Amherst, on September 7. Special rates for transportation over all routes will be arranged.

## Newport and the S. A. F. Convention.

The Society of American Florists, in the course of its annual pilgrimages, has met with warm and hospitable receptions everywhere, but the welcome has been most cordial and effective where the private gardener was to be met in force. Boston, in 1890, gave the Society a reception never to be forgotten, but Newport, in 1897, has outdone every previous effort by any club or city, and the gardeners and craft of that old town have crowned themselves with glory forever as hosts whose hospitality was unbounded, and whose every intent to please and entertain was carried out without hitch or flaw.

When it became known that the S. A. F. was to meet in Providence, R. I., in August of this year, it was agreed that the fourth or outing day of the Society would be placed in the charge of the gardeners of Newport, and to meet the case a society was formed and named the Florists' and Gardeners' Club and Associates; the leaders in the good work at once placed their shoulders to the wheel and finally, after the struggle and anxiety always attendant upon an effort of this kind, every preparation was completed and all that remained was to pray for a glorious day of sunshine, which, too, was granted.

The committee from the Newport Club, having the reception in charge were: A. K. McMahon, chairman; J. J. Butler, secretary; John Allan, treasurer; Robert Christie, Alderman B. F. Tanner, John Gibson, Richard Gardner, Hermann Lipse, A. MacLellan, Robert Hunnicks, Dr. Bradley, G. B. Reynolds, James Hovey, A. M. Chase, James McLeish, Andrew Melkie, Carl Jurgens, and A. Brandt, and all the members of the club were expected to assist in making the stay of the visitors pleasant. At the tent the ladies of the party were met by a reception committee.

Down the charming Bay of Narragansett came the dandy excursion steamer, Day Star, loaded with visitors, the Providence Florists' Club escorting and caring for the members of the S. A. F. until the pier at Newport was reached. The steamer unloaded 640 people on the dock, including a live band (the Hedley-Lervey) of 24 performers. At this point we were greeted by the committee of the local club; drags, stages, wagonettes, barges, coaches, and private turnouts to the number of 58 met the delegates, and soon in perfect order and good fellowship, under the direction of A. K. McMahon and George P. Lawton, all the conveyances were filled, and the ten or twelve mile drive, the first item on the program, was inaugurated. The route lay through the avenues and streets most renowned for their horticultural interest, and soon as Pelham street was reached the signs of the art which has made Newport famous and many notable illustrations of which were furnished in a recent issue of American Gardening, became conspicuous. The route was on past Spring street, Touro Park, and the Old Stone Mill, along Bellevue, Narragansett and Ochre Point avenues, the entrance to the Cornelius Vanderbilt estate, thence by way of Victoria and Lawrence avenues to Senator Wetmore's estate, driving through the grounds. The route then lay along the Ocean drive to "Indian Well," Mrs. J. R. Rusk's place, where the group was photographed by Mr. Frank H. Child. The principal places passed on the drive were those of:

Gordon Bennett (gr. Luke Fagan); E. J. Berwin (gr. Bruce Butters); Mrs. William F. Welds (gr. Philip Casey); Stuyvesant Fish (gr. William F. Burton); James Stillman (gr. John Gibson); R. T. Wilson (gr. J. F. Dailey); W. R. Travers (gr. William Allan); Robert Goelet (gr. Patrick Carr); Ogden Goelet (gr. J. R. Johnson); H. McKay Twombly (gr. Alex. Fraser); C. Vanderbilt (gr. R. Laurie); John R. Drexel (gr. J. F. Allen); Senator Wetmore (gr. R. Christie); John W. Ellis (gr. Alex. MacLellan); I. Townsend Burden (gr. Andrew S. Nicholl); George S. Scott (gr. William F. Smith); Perry Belmont (gr. Charles Hurn); Theodore Havemeyer (gr. Patrick McCarthy);

Henry Payne Whitney (gr. Michael Murphy); W. S. Wells (gr. Andrew S. Melkie); Charles N. Fay, Esq. (gr. Soren Morgan-son); Mrs. Burke-Roach (gr. James McLeish, Jr.); Mrs. H. M. Brooks (gr. James Hill); Mrs. William Astor (gr. James Boyd); William Waldorf Astor (gr. Hugh Williamson); Frederick Vanderbilt (gr. Robert Hunnicks); Commodore Gerry (gr. Harry Hogan); Mrs. John O'Brien (gr. Patrick Devine); Henry Clews (gr. James Murray); R. M. Cushing (gr. James Buchanan); Theodore M. Davis (gr. Hermann Lipse); Ross R. Winans (gr. Arthur Potter); Professor Agassiz (gr. Thomas Martland); G. M. Hutton (gr. John Donovan); Josiah Q. Low (gr. Daniel E. Sullivan); A. A. Low (gr. G. Mahon); J. W. Auchincloss (gr. Thomas Molden); William F. Burden (gr. William S. Nicholl); Morton Park (supt. Eugene Hughes); J. J. Wy-song (gr. James Kyle.)

The entire Ocean drive was taken in, and the party then drove to the beach, where caterer D. B. Allen had a large tent, 150x90 feet, erected on the lot next to his pavilion, arranged to seat 735 people at the one time. Here a regular Rhode Island clam bake with all the concomitants was served at 3 o'clock. The tent was tastefully decorated with American flags, plants and cut flowers, which, with the grass for a carpet, and the snowy white tent and tablecloths, made a very pretty picture.

On alighting the party was pleasantly surprised to find a committee of ladies awaiting their coming. These were: Miss Amelia J. Tanner, chairman; Mrs. A. K. McMahon, Mrs. J. J. Butler, Mrs. Gardner B. Reynolds, Miss Reynolds, Mrs. James Hovey, Mrs. Alexander MacLellan, Mrs. Thomas Gibson, Mrs. Robert Hunnicks, Mrs. Hermann Lipse, Mrs. John Allan, Mrs. James McLeish, Miss McLeish, Miss Jurgens, Miss Jessie Buchanan, Miss Margie Tanner, Miss Hodgson, Miss Bluck, and Miss Craig.

After the guests had been seated, and before making an onslaught on the tempting viands, the president of the local club, Mr. A. K. McMahon, made a short speech of welcome and direction, in which, amongst other good things, he said:

He was glad to have the S. A. F. visit Newport and the capital of Rhode Island. To provide for this reception they had organized the Florists' and Gardeners' Club and Associates. We have given you the ride through most beautiful places, but to see Newport properly, it would be necessary to spend a week here. He hoped the assemblage would enjoy every moment of time during their stay. President McMahon assured his hearers that the afternoon speeches would be short and few in number, and at the close of these the presentation of prizes won in the shooting and bowling contests would be made. He wished all a pleasant time and that the reception would promote pleasant recollections of Newport and the visitors be glad to come again. The guests then went at the dinner with a hearty good will, after which speeches were in order.

The Mayor of Newport, Hon. Patrick Boyle, was received with great enthusiasm. The Mayor said he could scarcely find words to give expression to his pleasure and delight at this meeting. Newport was the garden of America. It was very opportune for the S. A. F. to meet here and he would have liked to have welcomed the S. A. F. at the gates of the city. He assured his hearers that the people of Newport appreciated the visit of the S. A. F. to that city. Newport people were celebrated for their modesty, consequently he would not take up any more of the time.

Judge Holt was called upon to answer the Mayor's welcome. The judge was in good oratorical humor and made a very taking speech. He said he was called upon to perform a duty pleasant yet severe. Pleasant as receiving the freedom of the city from the Mayor, and severe because he was called upon to make this effort so soon after dinner. He would accept on behalf of the Society the invitation to stay a week given by the Mayor; he was equal to any emergency, when the emergency was one of this nature. Florists liked to be surrounded by

water when they did not have to take it themselves. The trip had proven most enjoyable, nothing could have been better arranged or more thoroughly carried out. The florists were ready to come again, whenever invited, as per the Mayor. In closing, Judge Hoitt thanked each and all who had contributed so largely to the entertainment of the day.

Here President McMahon interposed a word to say that his Society had been heartily supported in their efforts to provide for their guests through the liberality of the citizens of Newport.

The Hon. John P. Sanborn, editor of the Newport Mercury, was then called upon and made a very witty speech. The city of Newport was always glad to have strangers come amongst them. Come again and stay as long as you can and imbibe the breezes from old ocean. Come often and stay long. If the Society would hold its next meeting in Newport, he would guarantee to raise all the funds necessary, and would provide accommodation and entertainment equal to that which any city had ever furnished. In closing he repeated his invitation to come again and stay longer the next time. (The newspaper of which Mr. Sanborn is the present editor, the Newport Mercury, is one of the oldest in the United States, having been established in 1758.)

Many other delightful speeches followed in quick succession. President Graham was handed a gold watch as a token of the esteem in which he was held by his fellow members of the S. A. F., and to his good lady was presented a gold brooch of antique design set with a diamond.

After the speeches and presentations had been concluded, President McMahon closed the great event of the day by wishing all a Godspeed and pleasant journey home. "You are now at liberty to do as you please and go where you please." Three cheers greeted him, and the diners dispersed in the various directions to which their fancies guided them. It was to be regretted that so little time remained in which to visit more of the prominent gardens, the Cliff Walk, and other notable places, but when our convention is held in Newport we intend to take these all in.

At 7:30 P. M. the Providence visitors left, followed by the cheers of several hundred others of the delegates who had gathered to see them off, and "Auld Lang Syne" floated in beautiful harmony across the waters of the quiet bay. At 10:30 the Pilgrim hove in sight and the Southern and Western people made a break for their state rooms.

Then all was quiet in Newport.

The credit of this most successful reception and delightful day must be accorded largely to the untiring efforts of the following gentlemen: Robert Christie, R. Hunnlick, Hermann Lipse, A. MacLellan, J. A. Hovey of Weaver & Son, John Allan, President A. K. McMahon, and Alderman B. F. Tanner and his sister Miss A. Tanner of Newport. Amongst others rendering able assistance were Carl Jurgens, Gibson Bros., Andrew Meikle, Richard Gardner, James McLeish, Robert Laurie, and Charles Stark.

#### Notes in Newport Gardens.

Gardeners and other members of the craft, who with the convention paid a visit to Newport for the first time, were impressed by the beauty of the panoramic view as they were taken along the famous drive. The varied styles of architecture presented an unusual sight and all with expressions of wonder declared they had never before seen Hydrangeas so large or so blue—and truly, they were in remarkably fine condition. The marvelous grass on the lawns, which is a specialty of Newport, came in for liberal notice, as did the hedges and windbreaks of *Rosa rugosa*; the sight that these presented was to a great number of the visitors a revelation. Another novel feature to many was the innumerable and well-kept hedges of Californian and other Privet while here and there exclamations of surprise were to be heard when a postern gate or other prominence was passed, and it was noticed that superbly colored English Ivy was used as the covering.

A favored few were after the ride treated to an inside view of several estab-

lishments. In the grounds of G. P. Wetmore they saw how large *Livistonia chinensis* grows, the specimen on the lawn being fully 30 feet high and more than that number of years old. This is illustrated on page 597 of this issue. Some fine Cannas were also noted, these included one new one, now in commerce, which originated here, viz., Robert Christie. Some remarkably fine cut-leaf Beech trees were admired, also a grand tree of *Pinus nobilis*.

The famous sunken garden of J. Van Allen, lately figured, was a matter of interest to all in the use of fibrous Begonias. It is questionable whether Begonia Vernon and Erfordia have ever been seen in such perfection. Mr. Griffin, the gardener, has by selection secured a lighter colored variety, and used it in alternate beds to great advantage.

In the greenhouses of Ogden Goelet were seen some fine tuberous Begonias, choice exotic and other plants, while on the lawns the visitors were held spellbound by marvels of carpet bedding, and a Philadelphia visitor was heard to exclaim: "We can't touch these places!"

Robert Laurie at the Cornelius Vanderbilt residence had many fine things to show, but proudest of all was he of his Chrysanthemums, which from all appearances are to be heard of at the fall exhibition.

#### The Exhibition.

The trade exhibits were numerically fully equal to those of other conventions; and their nature equally varied, and for quality certainly on a par with any previous event. While it is further safe to say that the representation of plants used generally in the trade, far and away eclipsed the exhibits at previous gatherings, the various firms who deal largely in such stock evidently did their utmost to make a good showing.

The strongest part of the exhibition was undoubtedly with the plants, and the touch of color given to the whole by the wonderful exhibit of highly colored crotons from Robert Craig, Philadelphia, imparted a finish and tone which at once lifted this section into the highest order of merit.

Next to plants, in order of merit, came florists' supplies, which were of superior excellence and very extensively staged. These were closely followed by the displays of hot water and ventilating appliances, with greenhouse constructions. The number of firms represented in this department was very large.

Horticultural requisites, pottery, and sundries ranked next in order, and completed the list.

Absolutely new inventions, or novelties in plants, were scarce and of but average quality; evidently there is a dearth of plant novelties or else the growers are shy in bringing them out.

At the entrance stood a pyramidal group composed of 150 plants of *Adiantum Farleyense*, which deservedly came in for a great amount of attention, but the lion's share of credit and admiration went to Water Lilies. It is very possible that such a representation of these ever popular flowers was never gotten together at any previous convention or exhibition in this country! Commercially, they were represented by the firm of Henry A. Dreer, who had a tank, standing on the floor, in which a daily supply of new plants in flower or newly cut blooms maintained a constant freshness. This unique and beautiful contribution to the show was supplemented by another of a similar nature from Oakes Ames, Esq., of North Easton, Mass. (Carl Blomberg, gardener), which was set up in tubs and made a grand showing.

Coniferous plants were well represented by three exhibitors, each group being very creditable. A special feature attached to one of these was a number of *Azalea mollis* and *Rhododendrons*, which it was stated were raised from seed sown in January, 1894. This exhibit demonstrated that we, in this country, have reached a stage when we shall soon be independent of foreign nurseries in the raising of this class of stock. The size of these plants, and their vigor of growth in so short a space of time, were very remarkable. Commercially,

the convention may have accomplished much by being the means of giving publicity to this achievement. The credit for this educational display belongs to the Swan Point Cemetery Association, of which Timothy McCarthy is superintendent.

A few novelties were scattered around the hall, among these being a plant of *Lomaria Blechnum*, from A. MacLellan, Newport; this was a handsome specimen, and many guesses were ventured by visitors as to what it was, and some, without close observation, gave as their conclusion that it was *Cycas circinalis*.

W. A. Manda made an exhibit of fancy-leaved *Caladiums*, several of which were very highly colored, and one or two were commendable from the size of leaf and brilliancy of marking; for the main part they were under numbers instead of names.

J. C. Vaughan had on view a plant of the new *Canna Yellow Crozy*; it is of dwarf habit and the bloom nearly approaches a pure yellow, but at the time of our inspection, no flower spike was visible.

#### THE TRADE DISPLAY.

##### Section A—Plants.

JUDGES—Samuel Henshaw, New York, John Dingwall, Albany, N. Y.; and Alex. MacLellan, Newport, R. I.

F. R. PIERSON CO., Tarrytown, N. Y., was well represented by a table covering 300 square feet, including a fine lot of Palms, etc. *Pandanus Veitchii* was also noticeably good. In novelties there were *Heliconia illustris rubicaulis rosea*, and *Abutilon Savitci*.—Honorable mention.

From the same exhibitor came an exhibit of *Nephrolepis exaltata Bostoniensis*.—Certificate of Merit.

SIEBRECHT & SON, New Rochelle, N. Y., filled 240 square feet with the following arranged in groups: Ferns, *Dracenas*, Palms and *Araucarias*. Among Palms *Phoenixophorum grandifolium* and *Phoenix rupicola*, were in grand condition. In addition to these was a fine lot of *Nephrolepis cordata compacta*, and having special regard to the last, the judges made their award.—Certificate of Merit.

PITCHER & MANDA, Short Hills, N. J., made a display covering 100 square feet, mainly of Palms; among other plants in this group was a new *Begonia Rex*, named Providence, which, as a larger plant, will, no doubt, prove of great value. The color and habit are good, and it shows evidence of Pres. Carnot parentage.—Honorable mention.

ROBERT CRAIG, Philadelphia, Pa., put up in all 115 square feet; one-third of this space was taken up with superbly colored *Crotons* (some of which had been grown entirely in Jadoo); in all there were about forty varieties of which the most showy were: *albo lineata*, *Hackeri*, *Charmers*, *Czar Alexander*, *Thompsoni*, and *Reedi*. The balance of the exhibit consisted of Palms, etc.—Certificate of Merit for the *Crotons*. Palms and decorative plants.—Highly commended.

THE COTTAGE GARDENS, Queens, L. I., staged between forty and fifty varieties of Zonal *Pelargoniums*. Taking into consideration the season, the judges thought favorably of these.—Certificate of Merit.

L. H. FOSTER, Dorchester, Mass., staged a group of *Nephrolepis exaltata Bostoniensis*.—Highly commended.

H. F. LITTLEFIELD, Worcester, Mass., covered 48 square feet of space with Palms, Ferns, etc.—Highly commended.

CHARLES D. BALL, Holmesburg, Pa., arranged a superb lot of Palms, etc., covering a space of 112 square feet.—Highly commended.

DANIEL B. LONG exhibited *Smilax* plants from Risley flats.—Highly commended.

LEMUEL BALL, Wissinoming, Pa., staged a group of decorative plants which covered 35 square feet, including Palms, etc.—Highly commended.

J. H. COCK, Wyncote, Pa., had 97½ square feet of clean well grown Palms, etc.—Highly commended.

H. A. DREER, Inc., Riverton N. J., covered a space of 175 square feet with a general assortment of commercial plants.—Certificate of Merit.

W. A. MANDA, South Orange, N. J.,

covered 75 square feet of space with decorative plants, Orchids, bulbs, etc.—Honorable mention.

W. A. BOCK, North Cambridge, Mass., had a general assortment of plants.

CARL HAGENBURGER, Mentor, Ohio, sent a new *Coleus* named Klondike.

STORRS & HARRISON CO., Painesville, Ohio, staged to me grown H. P. Rose plants of exceptionally fine growth.—Highly commended.

C. H. JOOSTEN, New York City.—American grown Roses on own roots.—Highly commended.

#### Section B.—Cut Blooms.

JUDGES—John White, Pittsfield, Mass., S. Pentecost, Cleveland, O., J. A. Shellem, Philadelphia, Pa.

The H. A. DREER, Inc., had new French and Italian Cannas in twenty-five varieties, the best being Souv. d'Antoine Crozy, red, edged yellow; Avante Garde, yellow, spotted with red; Ami Jules Chretien, cerise-red, and Vice-President Luizet, bright crimson. Fringed Petunias were also shown in pretty variety here.—Honorable mention.

#### Section C.—Boilers and Heating Apparatus

JUDGES—Fred Burki, Allegheny, Pa.; F. R. Mathieson, Waltham, Mass.; H. A. Hart, Cleveland, Ohio.

HITCHINGS & CO., New York, had No. 57 hot water boiler. Owing to the great surface of water exposed to heat the judges awarded Certificate of Merit.

HERNDEEN MANUFACTURING CO., Geneva, N. Y., steam boiler.—Honorable mention.

JOSEPH PLENTY CO., Jersey City, N. J. The Howatt sectional boiler.—Highly commended.

SMITH & THAYER, Boston, Mass. The Winchester hot water heater.—Highly commended.

JOHN A. SCOLLAY, Brooklyn, Exhibited his invincible hot water boiler, which was highly recommended for its great heating surface and other points of merit.

HEWS & CO., North Cambridge, Mass.—An exhibition of flower pots.—Honorable mention.

#### Competition for the S. A. F. Special Medals.

JUDGES—Edwin Lonsdale, Philadelphia; M. H. Norton, Boston, Mass., and Wm. R. Smith, Washington, D. C.

AQUATIC PLANTS.—Display of cut blooms to be kept in good condition throughout the exhibition.

The first honors, the Society's silver medal, went to the collection from Oakes Ames, North Easton (Carl Blomberg, gardener), filling seven large tubs. This was a superb exhibit from a private col-

lection, the flowers remaining fresh and expanded, enabling their distinctive merits to be seen and appreciated to the full. *Nelumbiums* filled one tub. Tender *Nymphaeas* were well represented, notable among them was a most beautiful form of *N. stellata* named *Eastoniensis*, whilst hardy varieties were represented with as complete a collection as we have ever seen on public exhibition. The newest and most noteworthy to mention among these being *N. Marilacea Robinsoniana* with flowers of a brilliant indescribable shade of copper-red. *Sagittarias*, *Pontederias*, *Limnanthemums*, and other aquatics were included in this most instructive exhibit.

Bronze medal to Henry A. Dreer, River-ton, N. J., who was well represented in this section. His *Lotuses* were especially fine; conspicuous were: *album grandiflorum*, pure snow-white; *Kermesianum*, very large, deep rose-pink; and the exquisite *albastrata* with petals feathered like in a tulip. *Nymphaea O'Mariana* quite dwarfed into pygmies, by comparison, all other *Nymphaeas* in this large collection. It is a flower of immense size and brilliant color, altogether the most remarkable of recent additions to the tender *Nymphaeas*. *N. pulcherrima* and *N. Devonensis* were also well represented in the tender section; in hardy forms, *sulphurea*, *Robinsoniana*, *Illacina* and the pygmaea forms were well shown. The awards were given as above on the first day and without regard to the specification of the schedule.

HARDY CONIFERS IN POTS.—Three groups were in competition. The premier award went to the Swan Cemetery Co., Providence, R. I., for a meritorious collection, silver medal. Sam J. Lewis, Olneyville, R. I., second, bronze medal.

CALADIUMS.—Twelve fancy foliated varieties in pots, one plant of each.

W. A. Manda, South Orange, N. J., was awarded a bronze medal.

DISCRETIONARY AWARDS which were to be given for "any display of plants, showing advancement in culture or of special value to the trade," went as follows:

The Swan Point Cemetery Co., Timothy McCarthy, superintendent, a silver medal for a group of American-grown seedling *Rhododendrons* and *Azaleas*.

Pitcher & Manda, Short Hills, N. J., for a pyramidal stand of *Adiantum Farleyense* 7x7 feet, containing 100 4-inch pots and 50 5-inch, a Certificate of Merit; but the display deserved better recognition.

Alexander MacLellan, Newport, sent three grand specimen plants one each of *Adiantum pentadactylon*, each six feet or more in diameter, and nearly as high; *Anthurium Veitchii*, carrying eight immense leaves; and a superb plant of *Lomaria gibba blechnoides*, proving this last a grand addition to decorative Ferns.—Silver medal.

## The Fruit Garden.

Plan now what you intend to do in the way of planting among the fruits. Look over your back notes for any spring or early summer thoughts on transplanting or moving, for they do not always remain fresh in the mind. When the time for action comes around, quite a gain can be made by moving early in the autumn if the winters are not severe in your locality. It is not necessary to wait until the foliage is down, in fact, by moving early, the trees will endeavor to sustain the foliage by making new roots, which once started will continue until stopped by hard frost.

Trees moved should be heavily mulched, which if of a strawy nature, should be removed before it is covered with snow, otherwise mice are inclined to nest under it and make trouble.

In newly planted places the fruit trees are often planted closer than the regulation distance, and as they grow and each season rolls by, the thought of moving is gone over until it is doubtful if the work can be satisfactorily done. In the first place the moving of large fruit trees is not generally a success; secondly, I think it a mistake to plant other than at the permanent distance. Do that first and then if you are in a hurry for fruit or cramped for ready land on which to plant, use the space between the permanent trees, but always with the determination that the additions shall in no way interfere with the development of the permanent trees, but shall be restricted and eventually cut out. In this way, good results can be obtained. Keep the cultivator or rake moving among the new plantations. J. HOLLOWAY, N. Y.

## Plants Named.

[Specimens of plants for identification must be ample; mere scraps will not do, and no notice can be taken of such.]

(To E. Jaeger).—*Cornussericea*.

(To Ed. Parker).—*A. Chimaphila maculata*; *b. C. umbellata*. The other specimens were not sufficient for identification. As cultivated plants *a* and *b* are very pretty.

(To W. R. Meredith, Canada).—The leaf sent is from Schwendler's maple. The tree would answer for a private drive or roadway, but we think it too round headed for ordinary street planting.

(To L. B.).—*Lagerstromia indica*.

(To Mrs. Dunlop).—*Curcuma australasica*.

(To J. E. Chapman).—*Abelia rupestris*.

NOW READY.

# The Water Garden

BY WILLIAM TRICKER.

PRICE, \$1.50.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

## PRIVATE GARDENERS.

The staff of AMERICAN GARDENING begs to express to the fraternity of Providence and Newport sincere and hearty thanks for the many tokens of good-will and the assistance accorded it in the work of securing the most full and complete report of a convention which has ever yet been given in the columns of this paper.

### Appointments and Doings.

*Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.*

Mr. J. Dexter, lately of the Ogden Mills Establishment, Staatsburg, N. Y., has been engaged with Hon. W. C. Whitney, to take charge of his 6,000-acre estate October Mountain, Lenox, Mass., where Mr. Dexter will have a large scope for the exercise of his abilities. The area is still being added to, and extensive game preserves are being made.

Robert Wright as gardener to Mrs. Agnew, Palisades, N. J.

J. Baurhoffer as gardener to Mr. Poole, Harrison, N. Y.

### Oceanic, N. J.

The regular meeting of the Monmouth County Horticultural Society was held at Oceanic, on Friday, the 20th inst. Owing to the fact of this being the last meeting previous to the public exhibition, a great deal of interest was manifested in same. As is usual in such cases, a great many knotty points relating to the exhibition had to be disposed of, and it was a late hour when the meeting adjourned. All signs point to a successful exhibition.

### Mamaroneck, N. Y.

June 28 last we visited the gardens and greenhouses of J. M. Constable, Mamaroneck, N. Y., and at that date it is pleasing to note that the eleven acres of garden and pleasure ground were in the most perfect condition for cleanliness and neatness. While accustomed to seeing well-kept establishments we recall none that in this respect excels the one under mention; the lawns and shrubs and hardy flowers were in admirable condition; the glass houses were replete with stock of a high order, and included grapes, melons, cucumbers, tomatoes, Roses, Carnations, and a general line of exotic plants.

But for all this we were most interested in the practical tests of imported versus domestic varieties of cucumbers, potatoes, and tomatoes, especially the last.

At that date we found a row of tomatoes planted out against a wall and somewhat nursed and sheltered by a near-by greenhouse running parallel. There were eight kinds, six imported, and two American, eight plants of a kind, all under the same conditions, so that the test was a fair one, and remembering the good results attending Mr. Anderson's first trial with Sutton's Best of All, we immediately engaged him to make careful notes and comparisons for American Gardening. His remarks appear elsewhere in this issue.

### Springfield, Mass.

At a meeting of the Hampden County Horticultural Society directors last week, the following varieties of Sweet Peas were recommended as the best for general culture:

First twelve; Aurora, Blanche Burpee, Blanche Ferry, Burpee's New Countess, Firefly, Golden Gleam, Her Majesty, Lovely, Maid of Honor, Royal Rose, Stanley, Venus.

Second twelve; America, Countess of Aberdeen, Captivation, Dorothy Tennant, Gray Friar, Katherine Tracy, Lady Penzance, Mikado, Mrs. Eckford, Prima Donna, Ramona, Waverly.

Third twelve; Apple Blossom, Brilliant, Coquette, Captain of the Blues, Duke of

Clarence, Emily Lynch, Lottie Eckford, Meteor, Mrs. Joseph Chamberlain, Mars, Ovid, Senator.

The awards that were not made at the time of the recent Sweet Pea show were for Cultural Directions for Sweet Peas and for Criticism of the Sweet Pea Review, the entries in the first case were referred to a committee with power; the award for Criticism was made to W. F. Gale.

Springfield's City Forester has been dismissed for not taking orders from the Superintendent of Streets, under whose care the trees of the city have been placed. The Forester was right in his opinion that to execute his superior's orders was of no use, except to spend the city's money, and the whole affair shows the folly of having in charge of technical work those who have no knowledge of their subject.

### Detroit, Mich.

The Park Board finds itself short of funds and has reduced the salaries of the superintendent and discharged some assistants. R. J. Coryell has been engaged as landscape gardener.

### Boston.

The special aquatic exhibition of the Massachusetts Horticultural Society held last Saturday, August 21, was a disappointment so far as amateurs were concerned; but the untoward season has operated against best results. The chief display of aquatics came from H. A. Dreer, Inc., Riverton, N. J., to whom was given the first prize in the competition and a certificate for new hardy hybrid Nymphaea, named Falconeriana, a flower of the odorata gigantea type, very full, six inches in diameter, deep claret-crimson petals, stamens garnet with golden anthers. This is the finest American hybrid yet introduced. Another seedling shown, but as yet unnamed, has creamy yellow petals tinged rose on the reverse, with yellow stamens; an incurved flower, tender and night blooming. Other fine blooms were Nymphaea O'Marana, Laydekeri varieties, and Sturtevantii, Nelumbium Shieoman, the new giant double white Japanese Lotus. The second place was accorded to Oakes Ames, Esq., (Carl Blomberg, gardener), whose zanzibarenensis and eastonensis among tender, odorata Caroliniana, and chromatella were specially fine.

From the Cambridge Botanic Garden came a large collection of herbaceous plants. New French and Italian Cannas came from H. A. Dreer, a certificate being awarded to Allemania; the segments are yellow, with red center, larger than Italia; and to Gladiolus White Lady from the same source.

### H. P. Roses.

The Horticultural Company, Boskoop, Holland, at their branch in this country, situated at Rutherford, N. J., have planted out 6,000 standard H. P. roses; these recently have made a grand showing, having done remarkably well and flowered profusely. One prime old favorite which has been quite a success and is only now just going out of flower, is Gloire de Dijon.

### How's This!

We offer One Hundred Dollars Reward for any case of Catarrh that cannot be cured by Hall's Catarrh Cure.

F. J. CHENEY & CO., Props., Toledo, O.

We the undersigned, have known F. J. Cheney for the last 15 years, and believe him perfectly honorable in all business transactions and financially able to carry out any obligation made by their firm.

WEST & TRUAX, Wholesale Druggists, Toledo, O.

WALDING, KINNAN & MARVIN, Wholesale Druggists, Toledo, O.

Hall's Catarrh Cure is taken internally, acting directly upon the blood and mucous surfaces of the system. Price 75c. per bottle. Sold by all Druggists. Testimonials free.

## W. & D's.

### Celebrated Sure Crop.

MUSHROOM SPAWN. 8 lbs.  
FOR \$1.00.

Lilium Harrisii, Roman Hyacinths, Frezias, Paper White Narcissus, Callas, Etc., Etc.

Special PRICES on application.

### WEEBER & DON,

Seed Merchants and Growers.

114 Chambers St., N. Y. CITY.

Mention American Gardening when you write

MacDONALD & McMANUS, Wholesale Florists and dealers in Cut Flowers

50 West 30th St., NEW YORK CITY.

Solicit Shipments of Cut Flowers on Commission. Best market prices guaranteed.

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

WANTED—A position as gardener and florist either private or commercial place. English, married, small family. Several years' experience in both America and Europe, best of references. Address G. R. Mahood, Box 330, Olmhurst, Ill.

WANTED position as gardener, English, married, age 41, life experience in the culture of store and greenhouse plants, forcing grapes, mushrooms, etc., and the routine of flower and kitchen garden; excellent references. Apply Florist and Gardener, Post Office, Bridgeport, Conn.

SITUATION wanted. — Gardener, experienced greenhouse hand, well up in agriculture and landscape gardening, wishes head position on gentleman's estate under improvements, or assistant in greenhouses; references. Address General, care American Gardening.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advt., and each initial, or a number, counts as one word. No cuts or display type allowed.

GLASS at wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 454 W. Broadway, New York

EGYPTIAN ONION sets, for immediate delivery if wanted, \$1.00 per bus. F. O. B. Streator, La Salle Co., Ill. Address R. D. Kline.

EGYPTIAN ONION sets, fine stock ready for shipping. Write for special low prices on any quantity you wish. W. W. Thompson & Sons, Station D, Milwaukee, Wis., Box 24.

L. C. BOBBINK, Rutherford, N. J.—Dutch Bulbs, Clematis, Magnolias, Rhododendrons, Azaleas, etc. Branch of the Horticultural Company, Boskoop, Holland.

DO YOU WANT the best flower pots? If so, send address to The Whilldin Pottery Co., 713 Wharton St., Philadelphia. Three shipping points, can save you freight.

DIRECT from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

### Business Cards.

C. D. Zimmermann, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1607, New York City

## AGENTS WANTED.

Read this partial description of the best book of the kind for women which has ever been published, then write us for terms and territory.

## HOUSE PLANTS

AND

HOW TO SUCCEED WITH THEM.

BY

LIZZIE PAGE HILLHOUSE.

Scores of books have been written on flowers and their cultivation, but it has been reserved to Mrs. Hillhouse to cover a field of highest interest to women hitherto untouched, and to provide a reference book and complete guide for all her sisters who, loving plants, would ever be surrounded by them did they but know where to turn for such advice as to their preservation and instruction in their culture as would be open to them to follow, easily understood, yet thoroughly practical.

"I have bought book after book," the author says, "in a vain search for that knowledge which would enlighten me as to how to prolong the lives of my precious pets, when nothing with alarm their distressed appearance, only to find them all a delusion and a snare, so technical or ambiguous as to baffle beyond my reach or apprehension. Therefore, for the benefit of fellow sufferers, I have determined to put down what little I have found out from bitter experience, knowing it will be practical and true, as far as it goes."

"HOUSE PLANTS" has been written by a woman for the countless thousands of women who have no conservatory or hothouse, and are compelled to grow their plants in the home, and it gives freely of the knowledge which the author has been gathering through many years of observation.

Recognizing the fact that no book adequately covering the subject has ever been published, Mrs. Hillhouse has undertaken to fill the deficiency, and most ably and effectively has she accomplished the task. The result is a book of information and instruction, written in simple language, which will be prized and consulted by every woman so fortunate as to become its possessor. Of all books of reference issued for domesticated women, "House Plants" will take its position second only to the much prized and ever handy family cook book.

The amateur will be both surprised and delighted with the great range of plants which this book tells us it is possible to successfully raise in the house. Chapters are devoted to Bulbs, Cacti, Ferns, Flowering Plants, Foliage Plants, Lilies, Palms, Shrubs, Vines, Creepers and Basket Plants, and one on plants unclassified. A separate chapter on the propagation of plants is extremely interesting, as it is here so many fail.

Again quoting from the author, "In writing this little book, I have endeavored to keep strictly within the lines of my personal experience, and to select for description and suggestion as to treatment only those plants which I knew could be grown successfully in our living rooms or houses. This, undoubtedly, may be done if my instructions are followed.

"How little most people—bright people, too—know of the marvelous and amazing creations of the plant world. Those silent monitors, the flowers, are not dumb, but speak to us through the delicacy of their scents, their intricate shapes, complex habits, and the glorious penciling of their heavenly colors, that no human artist can command."

HOUSE PLANTS, 12mo., 220 pages, cloth, profusely illustrated, and with complete and ready reference index to all plants mentioned. Price \$1.00. A. T. De La Mare Ptg. and Pub. Co., 2 to 8 Duane St., New York, publishers.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Fittonias for Variety.

Among low-growing plants which may add considerable beauty and also much variety to a collection of plants, are the Fittonias. The foliage is netted much like that of our native Orchid, the Goodyears. The latter plant, however, cannot give us the exquisite pink netting that appears in some of the Fittonias, and which forms such a delightful contrast with the dark green groundwork of the leaves. The plants are classed with Begonias and Crotons, as requiring a rather high temperature.

#### Are the Eggs All Fresh?

Your hens lay fresh eggs, do they not? An odd question, perhaps, but that a certain would-be funny writer claims that some hens do not. At least, he says, several men of his acquaintance who bring their eggs to market every week do not always bring fresh eggs. Only by constant, daily care, and by throwing out any eggs that one may not be sure of, can any one dare guarantee as fresh, eggs from hens running at large. If the fowls are confined to small yards and houses the matter becomes much simplified but even then the best of care is necessary. And it is never safe to use added eggs for nest eggs.

#### The Various Solanums.

Is it not a pity that some of the plant dealers and catalogue makers should be so color blind? Solanum Wendlandii, they have told us, is of a most beautiful pale blue. Solanum Rantonetti is described as of deepest sky blue. This last is in bud with us, but we dare not expect it to be sky blue, because all of the other so called blue Solanums have been tinged with lavender or purple, and with not a hint of real blue about them. Wendlandii makes a handsome truss of very large flowers, but they are not blue, by any means. One of the best English authorities affirms that the white sort, Solanum jasminoides, is the most charming species of the family. So far as our own experience goes, we might say that the various "blue" Solanums have little more charm for us than the old deadly Nightshade that grew in a neglected corner. An exception might be made in favor of Wendlandii, however, because of the size and compactness of the truss, and the unusual size of the flowers.

#### The Otahelto Orange.

"We have seen a plant in a common window that was but 15 inches high, and had 23 oranges on it. With good sunlight they are never out of fruit, and at least two-thirds of the time are in flower also." The hundreds who fall with this plant should notice the clause, "with good sunlight," but it is to be feared that even this would never give us compact sprays of bloom such as the pictures show.

#### Common Names for Common People.

The Seaforthtias and Kentias and Latantias certainly seem to have more character, and to be better worth their price when appearing under their botanical names. Florists use these names altogether, and under these such plants are generally sold. Yet the demand for a common name for each plant for everyday use is almost universal, and a recognition of this demand appears in a prominent dealers' catalogue. A certain collection for the window, comprising decorative plants of seven different species, bears, in addition to the botanic names, names as follows: the Ostrich Feather Palm, the Fountain plant, the Fan Palm, the Giant Palm, the Silk Oak, the Curly Palm, the Umbrella plant.

#### Madame Bruant Fuchsia.

Is there any one who would not be tempted by the offer of a Fuchsia giving flowers "of a grandeur never before seen," and all for 20 cents? After this manner is described the new Fuchsia, Madame Bruant, which has pendant flowers of great size, with bright red

sepals, and corolla of lilac-mauve, veined with rose. It is endorsed by some of the best growers in this country, but has yet to make its record in the window garden. It makes a nice-looking and fairly thrifty plant, which has not so far bloomed for us.

#### Buying Potting Soils.

Many of those who do not have access to garden and fertilizer heap, or even to the rich mould of the woodland, may be uncertain how to obtain soil for potting the plants. Fertilizers of all sorts, they know, can be procured of the seedsmen, but it is not so well known that many of the large dealers will supply potting soils in almost any desired quantity. Rich compost, mingled so as to best suit the majority of plants, pure leaf mould, and other combinations, are available in desired quantities. Peats, fibers, and mosses, for Orchid growing, can be obtained from the dealers in these plants, not to mention the new Jadoo fibre that is to surpass all else as potting material.

#### Good-by Defender.

As the season advanced, the double white Petunia, Defender, was transferred to the garden for a test of its capabilities there. Weakened by being allowed to bloom while very small, buffeted by wind and storm, burned by fierce sun heat, and drowned by volumes of water, it has found the problem of existence much too difficult, and has given up the struggle. We bid it good-bye with regret, for there is a place in the winter window which it ought to have graced.

#### Value of Poultry Manure.

Questions as to this value are constantly coming up from those newly interested. A late editorial reply "guesses" it to be 25 cents per hen each year. If poultry manure bears a fair relation to commercial manure, this seems low. One pound of droppings a week, on the roosts only, is surely not a large estimate for a fair-sized hen. Commercial fertilizer at \$30 a ton is worth a cent and a half a pound. If we could figure the same for poultry manure, the value per hen would be more than three times 25 cents per hen, for the year, and for night work alone. Those who properly care for their yards and houses secure also, a large proportion of the value of excrement voided during the day. Now, possibly, these are large figures. It certainly seems large to count the manure from a hundred fowls as having an actual value of well towards \$100 a year. But it may stir up thought and give somebody a chance to throw stones. So much depends upon the fowls. If a hen produce one pound weekly, and if a pound is worth one and one-half cents, the rest follows without controversy.

#### Trees as Poultry Roosts.

The evils of trees as roosts are not difficult to see. They consist chiefly of exposure to the elements, and exposure to marauders of various sorts. Many are convinced that it is an unmitigated evil, a carelessness on the part of the owner, to allow the poultry such roosting privileges. "Privileges" they certainly are, as it is almost impossible to keep the young stock out of the trees; and the choice as to handling, may be considered as, at best, a choice of evils for none other of the young stock thrives so well as that which is allowed to have its own wilful way, with a swaying branch for perch, and the whole earth for a roosting platform.

#### A Point for Poultry Beginners.

When the size of a single fowl is considered, the amount of refuse from even a small flock is hardly credible to the uninitiated. The platforms can be cleared, but a large half of the refuse is deposited in the daytime, in the yards, where it is mainly uncared for. It is this fact which works havoc in the poultry business so often, rendering the second year less profitable than the first, while the third may be a failure. Let those who are beginners be careful that the yards are kept clean and sweet by spading, by fresh earth, and by cheap disinfectants, such as lime and gypsum.

MYRA V. NORRIS.

## WHOLESALE MARKETS.

### New York.

Fruits and vegetables continue to move fairly well, as far as clearing is concerned, but prices are rather more inclined to weaken than otherwise.

Supply of all kinds continues to get heavier, consequently there is a greater amount of inferior stock to be disposed of which has a tendency to reduce values very considerably. This is especially true of fruits; pears and peaches feel it perhaps more than any other; prices on these are very irregular and are difficult to quote intelligently. Some peaches make only 20c. per basket while others make 75c. and \$1.

Pears vary from \$1 per barrel to \$2.50 while state Bartlett's, very fine, in bushel baskets make \$2.50 each; such is the disparity in prices owing to the condition.

Tomatoes have improved in quality considerably, but it is too late to catch anything like remunerative figures. Prime fruit of the Acme type makes from 40c. to 75c. per bushel, others vary from 25c. to 35c. only. The continued spells of wet weather interfere with the melon crop and prevent prices from being anything like what they might be, owing largely to the inferior flavor of the fruit.

Potatoes are falling in value; the top price for Long Islands is about \$1.87 and New Jersey \$1.50 to \$1.75. Hot house grapes are plentiful and range from 50c. to 75c. per pound.

Apples—Alexander, hand-picked, per d.-h. barrel, \$2@2.50; Duchess of Oldenburg, hand-picked, d.-h. barrel, \$2@2.25; Gravenstein, hand-picked, per d.-h. barrel, \$1.50@2.50; Holland Pippin, hand-picked, d.-h. barrel, \$1.50@2; twenty ounce Pippin, hand-picked, d.-h. barrel, \$1.50@2; Codling, hand-picked, per d.-h. barrel, \$1.50@2; Orange Pippin, hand-picked, per d.-h. barrel, \$1.25@1.50; open heads, red fruit, per barrel, \$1.50@1.75; open heads, large green fruit, hand picked, per barrel, \$1.25; open heads, small and drops, 75c.@\$1.

Peaches—Missouri, per carrier, \$1.25@2; Maryland and Delaware, per carrier, \$1@1.50; extra yellow, per basket —; extra red, per basket, —; prime, per basket, 50@70c.; common to fair, per basket, 30@40c.; Jersey, extra, per basket, 60@70c.; prime, per basket, 40@50c.; common to fair, per basket, 30@40c.; culls, per basket, 15@25c.

Pears—Bartlett, Jersey, large clean, per barrel, \$2.25@2.50; poor to fair, per barrel, \$1@2; open heads, common, 75c.@\$1; up-river, per barrel, \$1.25@2; Clapps' up-river, per barrel, \$1.25@1.75; per keg, \$1; Bell, near by, fair to prime, per barrel, \$1.25@1.50; common kinds, per barrel, 50c.@\$1.

Grapes—Delaware, North Carolina, fancy, per 24-pound case, \$2@2.25; common, per 24-pound case, 50c.@\$1; Delaware, up-river, per 24-pound case, \$1.25@1.75; Niagara, North Carolina, fancy, per 24-pound case, —; common, per 24-pound case, 50@75c.; up-river, per 24-pound case, 50c.@\$1; Moore's Early Maryland and Delaware, 24-pound case, 50@75c.; upriver, 24-pound case, 75c.@\$1; Champion, up-river, per 24-pound case, 50@65c.

Plums—Damson, per quart, 4@5c.; Botan, per quart, 5@6c.; Green, state, per 10-pound basket, 20@30c.; table varieties, state, 10-pound basket, 30@40c.

Huckleberries—Shawangunk Mountains, per quart, 5@6c.; Pennsylvania, large, dry, per quart, 5@6c.; Pennsylvania, ordinary, per quart, 4@5c.; Jersey, per quart, 4@5c.

Watermelons—Usual qualities, per car, \$75@150; extra large, per 100, —.

### Boston.

The market is fairly well supplied with peaches, mostly from Missouri, no Delaware to any amount having arrived. Six basket carriers of Missouri stock selling \$1.85@2.25. Demand is very fair and fruit very good. Six basket Jerseys selling 50c. @ \$1.

Fair demand for home-grown tomatoes; others are not wanted.

Apple market firm; Astrachans and Williams all done; Codlins selling \$2.50 per barrel; Nyack Pippins \$2.50; other inferior grades selling \$1 per barrel.

Pear market very dull. Bartlett's selling \$1.25@1.50 a crate, same as last week. Clapp's Favorites about 50c. a bushel.

Watermelons are a little better demand, selling 12@18c. One commission man had on exhibition on the sidewalk one of the "Darkies' Favorites," weighing 50 pounds. He also had a load counting only 78 melons to the load!

Cantaloupes selling in crates at 75c.; barrels \$1.25.

Montreal melons moving quite freely \$7@10 a basket.

Green corn market unchanged; green peppers very dull; mushrooms \$1 a pound; blueberries 5@10c. a quart.

Celery \$1@1.25 a dozen bunches.

Marrow squash, good demand, about \$1.75 a barrel; homegrown stock is very nice.

Portland peas about all done coming; shell beans \$1.25@1.50.

Potato market strong with stock selling \$2.50, fancy \$2.75.

Sweet potatoes in small barrels, \$1.75; large barrels, \$2.

Cucumbers \$1.

Cauliflower market unchanged, stock very poor; cabbage same as last week, 4@5c.

Carrots 2@3c. a bunch.

Onions still losing strength, 75c. a bushel.

Pineapples unchanged from last week.

Parsley worth about 75c. a bushel; mint 40c. a dozen bunches.

Blackberries 8@10c. a quart.

Big crop of plums, California putting a good many into this market. Fine eating stock selling in 8-pound baskets, 35@50c.; cooking stock 25@35c.

Quite heavy receipts of grapes. Georgias in 5-pound baskets selling 12c. for Concord, 13c. for Agawams, 15c. for Niagaras, 12-basket carriers \$1.50.

The apple crop in Columbia County, N. Y., will be fully up to the average. Greenings will be a large crop, while Baldwins will fall far below the average yield. Pears, according to a Stockport shipper, will be an immense crop.

Southern Missouri is reaping a rich harvest this year from the peach crop. The scarcity of peaches in other large peach-growing sections and an increasing foreign demand have made the prices unusually good. Indeed, Missouri is enjoying the almost phenomenal combination of a big crop and high prices.

WHATEVER is worth doing, is worth doing well. Painting can only be done well by having the best materials—Pure White Lead and Pure Linseed Oil, properly applied. There is nothing else "just as good." Avoid "mixtures" and unknown brands of White Lead—the "sold-for-less-money" sort. (See list of the genuine brands.)

**FREE**

By using National Lead Co.'s Pure White Lead Tinting Colors, any desired shade is readily obtained. Pamphlet giving valuable information and card showing samples of colors free; also cards showing pictures of twelve houses of different designs painted in various styles or combinations of shades forwarded upon application.

National Lead Co., 1 Broadway, New York.

Mention American Gardening when you write.

### Fruit Growers Combine.

According to press report articles of incorporation are to be filed at Grand Rapids, Mich., for the Farmers' and Fruit Growers' National League, the mission of which is protection against unscrupulous salesmen.

In general the plan is that there shall be located in the markets of the country, first in the large cities, approved agents under bond, who will handle the shipments of the members of the association. The association will deal with the railroads, secure the best possible rates, see that all claims for damages to produce in transit are collected, and in general look after the interests of the shipper. It will be provided that there shall be no controlling interests in the corporation, so as to preclude the possibility of any one being given preference over another. It is expected that there will be a fair profit for the members in the difference between local and carload rates, the league being recognized as one shipper.

California crops.—The apricot yield is estimated at three-quarters, and is being shipped East at about seven carloads per diem. Plums and peaches over average; pears, under; grapes, largest on record.

I always find each number of American Gardening useful and interesting.—VOLNEY ROGERS, Park Commissioner, Youngstown, O.

## HENS AND EGGS

Undoubtedly there are many readers of AMERICAN GARDENING who keep hens who do not take a poultry paper; possibly some take the wrong one. Gardening, fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of POULTRY MONTHLY, to offer that journal in club with AMERICAN GARDENING, for the coming subscription season, both journals postpaid, one year, for the SMALL SUM OF \$1.25.

POULTRY MONTHLY Is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of AMERICAN GARDENING recommend Poultry Monthly as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

### A WONDERFUL OFFER!

American Gardening (Weekly), \$1.00 } Both \$1.25  
Poultry Monthly, - - - 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.  
Address AMERICAN GARDENING, P. O. Box 1697, New York City.

**We Believe** every reader of AMERICAN GARDENING feels proud of his paper and the practical, uplifting work it is engaged in; it is raising the standard of Gardening, and maintains the dignity of all engaged in the profession.

**We Believe** the cause of good Gardening to be eminently a missionary one; from which it follows that the circulation of AMERICAN GARDENING can most readily be enlarged through the efforts of its subscribers. Our circulation, therefore, is an index of our subscribers' interest in the paper.

**We Believe** our readers are anxious to see AMERICAN GARDENING reach the highest possible development in its work of horticultural education. The legitimate aim of a class paper is to increase its influence through an extension of its circulation.

**American Gardening** is the most successful of all, and has the largest circulation of any weekly Journal devoted to Gardening and Fruit Culture, but has scope and the disposition to add to its list tens of thousands of patrons. "Come with us and we will do you good," is a living truth in our case; all our new friends are loud in their praise of the value of the paper to them. The cause of "AMERICAN GARDENING" is the cause of American Horticulture.

**We Believe** that our friends are the ones on whom to call to push circulation. Understanding thoroughly the value of the paper to every one interested in gardening, they can best express its spirit and comprehensiveness and succeed in making subscribers.

**With a View** to obtaining the assistance of our friends in the propaganda for new subscriptions, and in order that they may have something tangible whereby to remember their successful efforts, we have compiled the following list of

## SUMMER

## PREMIUMS

## SUMMER

To which we invite your attention in the hope that each and every reader of the paper will endeavor to send us AT LEAST one new subscriber before the close of the season.

**American Gardening for 1896.** Containing 832 pages of text and illustrations, with complete index. The most full, complete, and desirable volume on Gardening, Fruit Growing, and kindred subjects ever issued. Few works on horticulture can compare with this in value to the student or the practical man. *Handsomely bound in cloth, with leather back and edges.*

This most desirable volume will be forwarded, express paid, to any address, for only seven new subscriptions at \$1.00 each.

**American Carnation Culture.** By L. L. LAMBORN. A work on the Classification, History, Propagation, Varieties, Care, Culture, etc., of the Divine Flower. Nothing has been left unsaid from which any practical benefit could be obtained. Illustrated. Third edition. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Beautifying Country Homes.** By J. WEIDEMANN. A handbook of landscape gardening. This is the most elegant and useful work on the subject ever issued in this country. It is beautifully illustrated with numerous fine wood engravings, and with 17 full-page and 7 double-page colored lithographs of places already improved. It contains general directions for lawns, roads and drives, walks, hedges, trees and shrubs, gardens, ornamental grounds, hints on burial lots, etc., etc. The beautifully colored plans of improved places are accompanied by descriptions giving the names and positions of the various trees and shrubs employed in planting, thus providing a complete planting map. Cloth, 4to. Reduced from \$15.00 to \$10.00.

*Given for 20 new subscriptions at \$1.00 each.*

**Bulb Culture (Henderson's).** By PETER HENDERSON. Contains special cultural directions for over 200 varieties of Bulbs. Compiled with great care, and its information is accurate, reliable and up to the latest. 25 cents.

*Given for 1 new subscription at \$1.00 each.*

**Bulbs and Tuberous-Rooted Plants.** (Their History, Description, Methods of Propagation and Complete Directions for their Successful Culture in the Garden, Dwelling and Greenhouse). By C. L. ALLEN. The author of this book has for many years made bulb growing a specialty, and is a recognized authority on their cultivation and management. He has taken the initiative to make bulb growing a special industry in this country, and writes from his own long and extensive experience. The subject is treated in a very exhaustive manner. Handsomely illustrated, cloth, 12mo. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**Canning and Preserving Fruits and Vegetables, and Preparing Fruit Pastes and Syrups.** By ERMENTINE YOUNG. This work gives a full account of the best methods by which the surplus fruits may well be saved for home use and for the large market demand, and a handsome profit accrues

to the home workers. A practical chapter on evaporation of fruits is embodied in the book. Paper, 20 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemums and Their Culture.** By EDWIN MOLYNEUX. Sixth Edition. By far the best practical work yet written on this subject. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Chrysanthemum Culture for America.** By JAMES MORTON. This is the only 'Mum book published for American use, and is an excellent and thorough work; especially adapted to the culture of Chrysanthemums in America. The field is fully covered. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Elliott's Practical Handbook of Landscape Gardening.** By F. R. ELLIOTT. Designed for city and suburban residences and country schoolhouses, containing designs for lots and grounds, from a lot 30x100 feet, to a 40 acre plat. Cloth, 8vo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Ferns and Fern Culture.** By J. BIRKENHEAD, F. R. H. S. How to grow Ferns, with selections for stove, warm, cool and cold greenhouses; for baskets, walls, Wardian cases, dwelling houses, etc. A thorough and complete work by a renowned specialist. 128 pp., thoroughly illustrated, 16mo., cloth. 75 cents.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit Culture, and The Laying Out and Management of a Country Home.** By W. C. STORNG, ex-president of the Massachusetts Horticultural Society, and vice-president of the American Pomological Society. Illustrated. New revised edition, with many new additions, making it the latest and freshest book on the subject. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Fruit and Fruit Trees of America,** or the culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. By A. J. DOWNING. Second revision and correction, with large additions. By CHARLES DOWNING. This work has no equal in the country, and deserves a place in the library of every pomologist. It gives descriptions of all the finest varieties of fruit, native and foreign, cultivated in America, and contains the names and synonyms of over 10,000 varieties. Over 1100 pp., with several hundred outline engravings, including supplements. 8vo., cloth. \$5.00.

*Given for 12 new subscriptions at \$1.00 each.*

**Grape Culturist.** By A. S. FULLER. New and revised edition, 1894. One of the best works on the culture of hardy grapes, with full directions for all departments of propagation, culture, etc. Illus., cloth, 12mo., \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Grape Growers' Manual.** (The Bushberg). An exhaustive work on the cultivation of the grape, with accounts of diseases, insects, etc., by specialists. The descriptive list of varieties is specially useful and complete; the typographical method of designating importance of varieties is a feature. Pp., 200. Royal 8vo. Illustrated. Cloth, \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Gardening for Pleasure.** By PETER HENDERSON. New and enlarged edition. A Guide to the Amateur in the Fruit, Vegetable and Flower Garden, with full directions for the Greenhouse, Conservatory and Window Garden. This is a complete encyclopedia of horticultural information, treating on soils, fertilizers, the lawn, garden designs, culture and care of plants, greenhouse building, heating, cottage and window gardening, the orchard, and many other important subjects. A monthly calendar of operations is also appended, which will act as a first-class guide to the amateur horticulturist. Illus., cloth, 12mo. \$2.00.

*Given for 4 new subscriptions at \$1.00 each.*

**Gardening for Profit.** By PETER HENDERSON. A guide to the successful culture of the Market and Family garden, profusely illustrated. Although written mainly for the market gardener, the amateur interested in vegetables or fruits can easily adapt its teachings to the smallest requirements. Cloth, 12mo. \$2.00.

*Given for 4 new subscriptions at \$1.00 each.*

**Greenhouse Construction.** By PROF. L. R. TAFT. A complete treatise on Greenhouse structures and arrangements of the various forms and styles of Plant Houses for professional florists as well as amateurs. All the best and most approved structures are so fully and clearly described that anyone who desires to build a greenhouse will have no difficulty in determining the kind best suited to his purpose. The modern and most successful methods of heating and ventilating are fully treated upon. Special chapters are devoted to houses used for the growing of one kind of plants exclusively. The construction of hotbeds and frames receive appropriate attention. Over one hundred excellent illustrations, specially engraved for this work, make every point clear to the reader and add considerably to the artistic appearance of the book. Cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**How to Grow Cut Flowers.** By M. A. HUNT. A thoroughly practical treatise on the cultivation of the Rose and other flowering plants for cut flowers. \$2.00.

*Given for 5 new subscriptions at \$1.00 each.*

**How to Know the Wild Flowers.** By MRS. WILLIAM STARR DANA. A guide to the names, haunts, and habits of our common wild flowers. The most handy and easy reference book for amateurs. With 100 illustrations by Marion Satterlee. 12mo. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**Henderson's Handbook of Plants and General Horticulture.** By PETER HENDERSON. This has long been acknowledged as the standard American work on general horticulture, giving history geographical distribution and cultural directions for all cultivated fruits and flowers. Illustrated. Cloth, 8vo. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Insects Injurious to Fruit.** By PROF. WM. SAUNDERS. A work of great value to all fruit growers, written by a man of science as well as a practical agriculturist, and the result of careful and minute observations and experience. It treats, under separate chapters, of the injurious insects which prey upon our fruit trees, vines and bushes, together with their mode of operation, and contains careful directions as to the best means of destroying them. With over 400 pages, 440 illustrations. 12 mo. Cloth. \$2.00.

*Given for 5 new subscriptions at \$2.00 each.*

**Johnson's Gardener's Dictionary.** This is a new and revised edition, greatly enlarged, of "Johnson's Cottage Gardener's Dictionary," first published in 1846; containing a full and reliable list of every plant in cultivation, names printed in bold type, rendering reference easy. An important feature of the work is the placing of synonyms alongside the correct name, instead of in a separate list. The habitat of each variety is given along with the date of its introduction. The cultural directions are brief and to the point. Insect foes, diseases and their remedies are fully described, and figures of some of the former have been given. Handsomely bound in one volume. \$4.00.

*Given for 9 new subscriptions at \$1.00 each.*

**Landscape Gardening or How to Lay out a Garden.** By EDWARD KEMP. Intended as a guide in choosing, forming or improving an estate (from a quarter of an acre to a hundred acres in extent), with reference to both design and execution, with numerous fine wood engravings. Cloth, 12mo. \$2.50.

*Given for 6 new subscriptions at \$1.00 each.*

**Parsons on the Rose.** By SAMUEL B. PARSONS. New and revised. A treatise on the propagation, culture, and history of the Rose. Illustrated. \$1.00.

*Given for 3 new subscriptions at \$1.00 each.*

**Peach Culture.** By JAMES ALEX. FULTON. New, revised, and enlarged edition. The only practical guide to Peach Culture as followed on the Delaware Peninsula, but essential to those cultivating this fruit in any other part in the United States. Fine cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Popular Flowers and How to Cultivate Them.** By E. S. RAND, JR. Illustrated. New edition, with appendix, revised and enlarged. Crown, 8vo. \$2.00

*Given for 5 new subscriptions at \$1.00 each.*

**Poultry Culture.** By K. FELCH. How to raise, manage, mate and judge thoroughbred Fowls. Cloth, 12mo. \$1.50.

*Given for 3 new subscriptions at \$1.00 each.*

**Practical Floriculture.** By PETER HENDERSON. A guide to the successful propagation and cultivation of Florists' Plants. As in every work from this gifted author's pen nothing has been left unsaid that bears on the subject. Illustrated. Cloth, 12mo. \$1.50.

*Given for 4 new subscriptions at \$1.00 each.*

**Profits in Poultry.** Useful and ornamental breeds and their profitable management. This excellent work contains the combined experience of a number of practical men in all departments of poultry raising. It is profusely illustrated and forms a unique and important addition to our poultry literature. Cloth, 12mo. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**Secrets of Rose Culture.** By W. J. HATTON. In this neat volume are described all the newest and most improved designs for building rose houses, heating, ventilation, management, and much other valuable information on rose culture. The latest and best varieties of roses for every purpose and condition are named, and their special values pointed out. 162 pp. Illustrated, 12mo., paper. 50 cents.

*Given for 1 new subscription at \$1.00 each.*

**Strawberry Culturist.** By A. S. FULLER. Containing the history, sexuality, field and garden culture of strawberries, forcing or pot culture, etc., fully illustrated. Flexible cloth, 12mo. 25 cts.

*Given for 1 new subscription at \$1.00 each.*

**Success in Market Gardening.** By W. W. RAWSON. Illustrated. This work is written by one of the most successful market gardeners in New England, who gives here the results of his life-long experience in the growing of vegetables out-of-doors and under glass, with special adaptation to the climate of New England. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

**The Art of Propagation.** By J. JENKINS. A concise, practical treatise on the rapid multiplication of vines, plants, trees, etc., detailing the management in propagation of seeds, bulbs, cuttings, etc., and the manner of operating in grafting, budding, inarching, etc. Ample illustrated. 30 cents.

*Given for 1 new subscription at \$1.00 each.*

**The Amateur Orchid Cultivators' Guide Book.** By H. A. BURBERRY, F. R. H. S., orchid grower to the Right Hon. Jos. Chamberlain, M. P. Tells how to grow Orchids, in cool, intermediate, or warm houses, successfully. There is a calendar of operations for each month, and full information as to the treatment required by all orchids mentioned in the book. Just published. New edition, colored plates. \$1.75.

*Given for 5 new subscriptions at \$1.00 each.*

**The Nursery Book.** By PROF. L. H. BAILEY. This is a complete handbook of propagation of plants treating on seedage, separation and division, layerage, cuttage, graftage, including grafting, budding, inarching, etc. It tells plainly and briefly what everyone who sows a seed, makes a cutting, sets a graft, or wants to know. \$1.00.

*Given for 2 new subscriptions at \$1.00 each.*

# Potash

is one of the three important ingredients of a complete fertilizer; the others are phosphoric acid and nitrogen. Too little Potash is sure to result in a partial crop failure.

## Free

An illustrated book which tells what Potash is, how it should be used, and how much Potash a well-balanced fertilizer should contain, is sent free to all applicants. Send your address.

GERMAN KALI WORKS, 93 Nassau St., New York.

Mention American Gardening when you write.

## Diplomas and Certificates

HORTICULTURAL SOCIETIES,  
FOR FAIRS, INSTITUTES, : :  
GARDENERS' CLUBS, ETC.

These should be selected well in advance of the date needed, and secretaries of above should send now for our set of samples, all of which have been especially designed by first-class artists and engravers for the purpose. Owing to the wide demand for these samples and their expensiveness, we will mail the set of five, postpaid, for \$1.00; money refunded on return of samples, or placed to credit of order, as directed. One single sample sent free on application if the writer will explain the exact purpose for which it is needed.

FIG. 173.—VIEW OF THE VICTORIA POND IN THE SHAW BOTANICAL GARDEN, ST. LOUIS, MO.

The view presented above shows Mr. J. Gurney the head gardener standing upon one of the leaves of the plant. The pond was constructed in 1894. A great work is being done by the directors of the garden which according to the last report had 301 named species of trees, 561 shrubs, 1129 hardy perennial herbaceous flowering plants, 39 hardy ferns, and 35 named species and varieties of aquatic and marsh flowering plants. The total number of species, other than annuals, grown numbers about 4000.

## The Cost of Producing Some Garden Crops.

During the last few years I have kept an account of what it has cost me to produce and place on the market some garden crops. The results are now valuable to me—and perhaps they will be so to others also—for from them I can now decide which crops are the most profitable for me to grow if I am obliged to place them on the wholesale market. About the only crops that I have been able to grow with a profit for other than the local market are small fruits, celery, and cauliflower.

Among the small fruits there is the greatest expense for fertilizers and labor in producing strawberries. My records of the last three years have shown what it has cost me to produce a quart of berries when I have obtained a yield of 700 bushels per acre. When I get larger crops the cost of production is of course much less.

My items of expense in growing an acre of strawberries run about as follows: Interest on money invested in land at 5 per cent., \$10; fertilizers, including mulching material, \$50; plowing, harrowing, and marking, \$5; transplanting, \$10; keeping up stock of crates, \$10; cultivation, \$85; picking 3,200 at 1½ cents, \$48; making a total of \$168. This gives us about 5 cents per quart as the cost of production. Thus, with an average crop of strawberries, one must obtain more than 5 cents per quart to get a margin above the cost of labor, fertilizers, etc., at their market value. Of course if one can do a part of the work himself, or obtain fertilizer more cheaply, so much can be deducted from the expense account.

If a yield of 200 bushels per acre be obtained, the figures show that the cost of production will not be above 3 cents per quart, and if by using more fertilizers and doing more work, a still larger yield is obtained, the cost of product will be less in proportion as the yield is increased.

The records show that raspberries can be produced at a less cost per quart, usually at 3 to 4 cents; currants 2 to 3 cents. The other small fruits I have grown in only small quantities, so have not kept an account of expenses as yet with them.

Among the vegetables my main money crop is celery, and on this I have been able to figure closely as to cost per 1,000 plants. I can grow good celery by the method I use—which is a modification of the "new" celery culture—at a cost of about \$6 per 1,000 plants. The expenses may be briefly itemized as follows: For fertilizers preparing the ground, and interest on investment, \$1.50; growing the plants and transplanting, \$1; cultivating until ready for blanching, \$1.50; placing the blanching boards, 50c.; (the celery is in double rows, so one-half of the work is saved); distributing the water in irrigation estimated at 50c.; trimming and packing for market, \$1; making a total of \$6 per 1,000.

In estimating the market value of the 1,000 plants, one must take in consideration that 25 per cent. or more may be culls, so that it will cost \$7 to \$8 per 1,000 to grow marketable bunches, and by the methods of culture usually practiced, considerably more.

We see from these figures that if one knows how to grow and market celery, he will not lose, if the price in the wholesale or general market for medium celery drops to \$10 per 1,000 or one cent per bunch; also that larger profits are made by producing a superior article.

It has cost me about \$2 per 1,000 to grow marketable cabbages, and from \$3 to \$4 to grow cauliflowers that are marketable; for often there are a good many culls among the latter. In growing these the largest item of expense is for fertilizers, for no other crop require so much feeding.

While keeping these records I have also noted the quotations in the city markets, so that I can now figure pretty closely on the margins in growing these crops when the fertilizers are all purchased and the work paid for.

Some gardeners like to grow crops for me by contract, i. e., I furnish land, fertil-

izers, horses, and tools, while they do all the work. These records show me how much I can afford to pay them for their crops.

About \$5 per 1,000 can be paid for marketable bunches of celery, and everything needed to grow except labor furnished. The cost of producing crops, of course, varies under different conditions, and the inexperienced in growing those crops extensively would probably fail to obtain any margin for profit.

W. H. JENKINS, Delaware Co., N. Y.

## Root Galls of Cultivated Plants.\*

Galls, that is unusual malformations of small portions of a plant, occur upon leaves, stems and roots, and may be induced by insects or other animals, fungi, etc. The time limits of this paper will not even permit the briefest outline of the various forms of galls of leaves or stems, and the subject assigned me is at once taken in hand.

Root galls are many and equally various as to their origin. A cabbage or turnip plant, for example, is making a death struggle, and upon removing its roots from the ground, they are found malformed beyond what the imagination would picture. The English truckers call it "finger and toes" in an attempt to describe in the name the strange combination of roots. We called it "club-root," or "clump foot," but by whatever name it is known, the fact remains that the root system has been wonderfully malformed, and instead of the ordinary fibrous roots, there are presented a multitude of ill-shaped nodules strung together in a mass.

This galling of the turnip, cabbage and allied plants is due to a minute fungus that makes its attack upon the plant, while it is quite young, and the roots are small and tender. The germs are in the soil and remain there for years feeding upon the roots of weeds or other plants belonging to the cabbage group of plants. Thus the mustards, shepherd's purse, pepper grasses, and similar weedy plants, all harbor the club-root fungus. This fact of the wide range of the turnip club-root pest is brought out to show how plants related to the crop infested may be the means of preserving the enemy and even increasing the germs in a soil, while the field is devoted to some other crop, simply because the weeds as nurse plants of the fungus are permitted to grow.

Instead of a cabbage, one pulls up a vigorous bean plant. Upon its branching roots are a score or more of nearly spherical bodies half the size of small peas. These are the so-called tubercles, and consist of a wall of normal bean root tissue; but within this the cell contents consist of innumerable bacteria-like cells.

The following is Tübeuf's description of these galls as translated by Smith in the large book upon "Diseases of Plants," issued during the present year: "The short-red-shaped microbe forces its way into a root hair or epidermal cell, multiplies there, and is conducted to the inner cortical cells by plasma threads continuous through the cell-walls. A rapid division of the inner cortical cells is set up, till a tubercle is formed. The bacteria multiply simultaneously, and are transferred into new cells where a great change comes over most of them; they enlarge very much and become club-shaped or dichotomously branched bodies without power of division. The great importance of the tubercles of leguminosae is that the plants bearing them are capable of taking up free nitrogen from the atmosphere and utilizing it."

This somewhat lengthy quotation has been made because the finding of these galls upon the roots of clover and other leguminosae by some growers of roses and other ornamental plants had led to some discussion in the public press. The galls common to the clover roots and those of peas, beans and many other plants are not due to the same cause as those met with upon the roots of many ornamental plants, and the finding of them upon the clover growing in a certain soil should be

in no way used as a reason for discarding that soil for greenhouse purposes. In like manner the galls produced in the roots of any clover or clover-like plants in a bed devoted to roses is no index whatsoever that there is danger of the roses becoming galled.

The subject of tubercles and the peculiar relation that they bear in the economy of the plant bearing them forms one of the most interesting chapters in modern vegetable nutrition. In case of the galls upon the cabbage roots, they are a positive injury, and sooner or later the plant loses the power of root absorption and wilts and dies; the roots in the meantime becoming rotten and foul smelling. With the tubercles of the leguminosae there is increased vigor given to the plant that bears them, and the advantage of their development is a well-recognized fact which is taking practical shape in the artificial propagation of the tubercle germs and their being sown where there may be otherwise a lack of them in the soil.

In the third place, let us consider the nature of the root gall of the roses. These are not due to fungi or the organisms that produce the tubercles of the leguminosae plants, but result from the attack of microscopic worms that are known as nematodes. These creatures are in form like that of an ordinary eel, and under the microscope are easily recognized by their almost constant wiggling, thus giving them the common name of eel-worms. The general appearance of rose roots when infested with the nematode worms is not unlike that of a lupine or a sweet clover plant. The galls of the one might easily be mistaken for those of the other until the microscope is brought to the rescue when the differences become so remarkable that the wonder is that causes so widely separated should produce results that to the naked eye are so similar.

The galls of the rose vary much in size and shape, but usually are but a small fraction of an inch in diameter and consist of enlargements of the fibres of the root system.

These nematode galls are much more abundant upon the roots than generally known, and because of their being underground, they remain unnoticed until the infested plants show unmistakable signs of decline, when an investigation results in the discovery of the root galls. They are much more abundant in warm climates than elsewhere, and that is one reason why they are especially prevalent in the greenhouse.

In looking up the subject of a tomato blight in Mississippi, a few years ago, the writer was impressed with the fact that nearly every tomato plant was affected with root galls due to nematodes. In the North the freezing of the soil thoroughly and deeply during the winter tends to keep these roots' enemies in check, and from experience, it is a fact that they are more abundant in seasons that follow mild winters.

In this there is a practical suggestion, namely, the long, hard freezing of a soil that is to be afterwards employed in the greenhouse for the growths of plants like roses and violets that are very liable to attack from the nematodes. These worms propagate with great rapidity where conditions favor them, and it is better to take all precautions in keeping them out of the bed at the outset than to leave the work of eradication until after they are well established in the plants.

This leads directly to a consideration of precautionary measures. In the first place, the plants should be free from the worms—the most difficult end to reach, as it means a removal of the earth and a careful examination of the roots with the rejection of all plants that are infested. The eel-worms may come in with the earth, and, as before stated, they infest the roots of many plants, there is difficulty in making a selection and feel at all certain of freedom from the worms. Soil that has been used for growing a previous crop should be discarded, especially if the plants lacked in vigor, due to inroads upon them made by the nematodes. Freezing, as before stated, is a cleansing process for the soil. On the other hand, a high temperature is also inimical to them. The heating of the soil

\*Paper by Dr. B. D. Halsted read before S. A. F. Convention at Providence, R. I.

either baking or steaming, is probably the more valuable of the two treatments, and has been resorted to by some growers with cheering results. If manure should be the chief vehicle for the entrance of the worms, it may be possible to either heat it, or else resort to plant food added in the form of commercial fertilizers. It is also possible that some substance may be put upon the soil, that while harmless to the plants, may kill the worms that are not already in the roots of the plants. Lime is such a substance, which when sprinkled over the surface, will at each watering, yield a lime wash that is destructive to the worms it reaches. Kainit, one of the leading commercial fertilizers, has proved effective in combating insects that work through the soil, and it is not unlikely that this substance may prove of value in the greenhouse.

In conclusion, it has been the attempt in this brief paper to call attention to three classes of root galls by citing one case of each. First, those malformations of roots like the club-root of the cabbage due to a low form of mold, the germs of which enter from the soil, and when in sufficient number, destroy the affected plant.

Secondly, the root galls of clover and

referred to the remedy suggested in Henderson's "Gardening for Profit," for club root, (which was simply an enlargement of the root glands, stopping the flow of sap drawn up by the mouth of the feeding roots, thus checking the development of the plant), and that was lime. Lime is an almost insoluble substance. It takes about 1,000 pounds of water to dissolve one pound of lime. In the application of lime water to greenhouse plants the calculation should always be made that the soil is being put in a semi-tropical condition. It is never subjected to a frost-cleansing influence, unless the soil is thrown out. Mr. May has an expensive plant for sterilizing the soil to destroy all life that was in it, but this would not be practicable on places of smaller extent than his. The speaker advised the use of 100 pounds of lime, thoroughly slacked until it is fine, to which should be added three pounds of nitrate of soda, dried by exposure until it has lost a goodly portion of its crystallization—none of the vital part of the chemical is lost thereby, only a little of the weight; reduce it to a fine powder either by a rolling-pin or by stamping it underfoot. Mix thoroughly with the soil that is to be put in the benches. Or the powder may be applied on the soil after the roses are set, by a

## Pond's Seedling Plum.

The accompanying figure shows Pond's seedling Plum, seven years planted, with its third crop of fruit, as growing on nursery grounds of M. J. Henry, Vancouver, British Columbia, Canada.

"This variety," that gentleman writes, "has proved to be one of our very best late market Plums for the Pacific Coast, ripening September 1 to 15, directly after the Bradshaw and Columbia; fruit large, egg-shaped, flesh color, selected specimens have weighed three to the pound."

## The Vegetable Garden.

**Spinach.**—Any vacant piece of ground may be utilized now for spinach to stand over winter, and be available for early spring use. The ground having been first prepared by manuring and digging over, seeds should be sown in drills 15 to 18 inches apart. Before hard frost give a slight protection of salt hay or light strawy manure, not covering too thickly before settled hard frost. When this protection is carefully removed in the early spring, the spinach will soon commence to grow, and come in quite early. It should not be sown on any but light dry soils, where surface water quickly escapes.

**Cabbage and Cauliflower.**—Hoe these after every rain. If they are coming in too early, they may be checked by cutting away one-half of the roots by the use of the spade on one side only of the plants. The green worms are liable to appear at this season in great numbers, and if not checked and destroyed, will soon skeletonize all the leaves, making the plants useless. The plants should be watched every day, and as soon as any worms make their appearance, dust with hebebores or slug shot; these substances, however, should not be used if the plants are heading, and instead a little alum water sprinkled on will be an effective check.

**Lettuce.**—A good supply of lettuce sown now will come in very usefully later to transplant into the cold frames, and if then properly protected from frost, will give a constant supply until quite late in the winter. The most satisfactory all round variety for this purpose, we find in the Curled Simpson.

**The Weeds** have of late been growing very rapidly in the garden, owing to the unprecedented wet season. The days are quite infrequent when hoeing can be done with advantage, but every opportunity should be taken to hoe, as weeds look bad and take not a little nourishment out of the ground. It is best in such weather after hoeing to take a coarse rake and gather whatever weeds and rubbish possible and cart them entirely away, taking care not to allow any to remain on the walks. At this season of the year the garden will contain old vegetation, as blighted potato and tomato vines, peas, onions, that harbor fungous spores or insects, or weed seeds. Some part of the premises should be selected where all such could be put, and when it gets dry enough, burn every atom, thus destroying, instead of preserving, many of the causes of blight and insects, that will surely attack the crops another year, if all be dumped into the manure pile, to be in all probability again carted into the garden. This is the only method by which these foes can be kept at bay.

**Herbs.**—Those desiring to dry any herbs for winter use, should now cut what they want, tying in small bunches and hanging either under a shed or under a tree to dry. If dried in the sun, they become brittle, and are not so useful. Sage, Thyme, Summer Savory and others are useful for this purpose.

W. M. EDWARDS, Conn.

The states of Missouri, Kansas, Nebraska, Iowa, Minnesota, Wisconsin, and Illinois will join in making a gigantic fruit display at the Omaha Exposition next year. The representatives of the societies met recently and further arranged for a grand apple parade and carnival to be given in October, 1898.

FIG. 174.—TREE OF POND'S SEEDLING PLUM.

clover-like plants which are produced by bacterial germs, but instead of inducing decay, promote the life of the plant in which they are lodged. Between the clover and the tubercle germ there exists, so to say, a mutual understanding, and their life processes are united for the benefit of both.

Lastly, a third class of root galls is considered, namely, those most abundant upon the roots of greenhouse plants, and much dreaded by florists. These are produced by microscopic worms that, thriving in the tissue of the abnormally swollen roots, check the activity of the plant, and ultimately may cause it to sicken and die.

For the eradication of these microscopic eel-worms, there are certain precautionary measures that may well be borne in mind, namely, the examination of all that are galled; the cleansing of the soil in all its constituents by freezing, baking, or steaming; the use of lime-water while the crop is growing, and possibly that of kainit or some other commercial fertilizer, bearing in mind always that sick plants are unprofitable, and good management means watchfulness from the start and always.

Benjamin Hammond, Fishkill, N. Y.,

"duster," such as is used for the application of Paris green. The mixture should be spread on top of the soil until there is a white dust all over it. The experiment could be tried in a house where there are two or three benches, and the results could then be noted.

In answer to Mr. Cushman, of Euclid, O., as to the part played by nitrate of soda in the mixture, Mr. Hammond stated that it gave a rapid and vigorous growth to the plants, and the more vigorous they are, the more roots the plants would have to feed them and keep them going.

The fruit-growers of Chattanooga, Tenn., are not altogether satisfied over their crops this year. One of them said recently that the fruit crop was of an inferior grade and the prices were exceedingly low this season. There was an abundance of fruit, but a great deal of it was unfit for shipping purposes. More was realized on the strawberry crop than on anything else.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send us stamp for our new catalogue.

## The Missouri Botanical Garden.

To the Editor of American Gardening.

The writer regrets that space will not permit him to give as lengthy description of this noted garden as he would like. The Missouri Botanical Garden was founded and endowed by Henry Shaw, an Englishman, who amassed a fortune in St. Louis, at the hardware trade. His estate was in the suburbs of St. Louis, or now the Botanical Garden. At first the grounds about his country home were planted and laid off with care, as a means of making his home beautiful. But as they began to attract the public and the public began to be interested in them, they were made welcome.

In 1858, their proprietor conceived and began a plan for converting them into a scientific institution, after the model of the gardens at Kew, England. He secured a legislative act from the state to place the garden, during his lifetime or by will, under management of a board of trustees.

Mr. Shaw left a fine endowment for the garden. The board of trustees, according to Mr. Shaw's will, consists of fifteen members, ten of whom are designated by name, while five act as trustees because of their office: the Mayor of St. Louis, the Bishop of the Episcopal Diocese of Missouri, the president of the Academy of Science, the president of the Public School Board, and the Chancellor of Washington University of St. Louis.

In forming the Botanical Garden, Mr. Shaw contemplated providing pleasure with incidental instruction for the public and training gardeners and botanists. The first of these wishes is met by maintaining the garden and greenhouses in as attractive and instructive a manner as the means at the disposal of the trustees permit. For the second he endowed a school of botany as a department of Washington University, in connection with which institution the laboratories are located. The trustees have also established a course of study and manual work for such garden pupils, and have created six scholarships of four years duration for such pupils, who are paid a sufficient sum to cover their board, and in addition are given rooms in the lodge at the northwest corner of Tower Grove and Magnolia avenues, where they have the use of a reading room containing the principal text-books on gardening, and the best of the current horticultural periodicals.

The director of the garden is Dr. William Trelease of Washington University. The director and his assistants, with such special students as are able to do advanced work, are continually occupied with a study of scientific investigation of matters connected with botany and kindred subjects, the results of which are published in a series of annual reports and elsewhere.

There is an herbarium building which contains the herbarium and library of the institution. It is open only to students or investigators and persons having business with the director, whose office is located in it. The herbarium contains the large collection of the late Dr. George Engelmann, consisting of about 100,000 specimens, and a general collection of about the same size, including the herbarium of Professor Bernhardt.

There is also a good library of about 12,000 volumes, some of which are pamphlets. But in the reading room and elsewhere on the first floor, current accessions and works of the most general character are kept. The books most likely to be consulted in connection with the herbarium are distributed through rooms where the specimens of plants are kept. The horticultural library is kept about the offices of the horticultural assistant.

While the library and herbarium are closed to the general public, visitors competent to use them are always welcomed and given every facility for study.

The main greenhouse contains a variety of specimen plants, a large specimen of Mauritian Screw Pine, the Traveler's tree

of Madagascar (*Ravenala Madagascariensis*); also a large collection of Cacti, including the Giant Cactus of Arizona, Agaves, and Yuccas. There is also a nice collection of economic plants.

You also will see in the garden a large specimen of *Pritchardia Gaudichaudiana*, presented by Dr. Asa Gray; the Southern Palmetto, *Kentia Belmoreana*, *Scaevola elegans*. Directly in front of the gate and before the main greenhouse is the parterre, a sunken space in which bedding plants are massed during the summer season, while at both sides of the entrance way the larger Cacti and Yuccas are generally grouped.

Near the parterre are several ponds, where some of the more ornamental Water Lilies are grown.

W. L. MOORE, Tex.

## Chrysanthemums.

**Feeding.**—September is the month when feeding occupies a large share of the time, and feeding, like everything else, needs a little care. Many a man has gone around rubbing his hands with glee as he saw his plants running up and making great stems and looking as though they were going to produce a flower big enough to "knock the spots off the sun,"

FIG. 175.—VERTICAL SECTION OF LORD & BURNHAM'S STANDARD BOILER. (See page 617.)

and (incidentally) his rivals, and later wondered why somebody else with a comparatively insignificant looking lot of plants produced flowers just as good as his. Plants can get a surfeit of good living just as easily as a man can. Natural manures as horse, cow or sheep manure seem to be of more use to the Chrysanthemum than artificial ones, changing off from week to week from one to the other, and not forgetting every little while to stop and give some clear water to wash down the manures and sweeten things out a little.

**Well Ripened Wood** is the only secret of high-grade flowers. Back in the summer in these notes I said that the less manure was used in soil the better. The plants should make in summer good healthy wood without being rank; then when fall comes, such wood ripens well, with little pith in the center, stands with impunity lots of feeding, and does credit all round. The crown bud is swelling rapidly, and the stem is hardening and thickening down in a manner that gladdens the heart of the grower; such wood is easily ripened, but where the bud has not yet appeared run easy on the feeding till it shows itself.

**Syringing** should be eased up as the days get shorter, and the house should

be pretty well dry before nightfall; a spray over in the morning and after dinner on sunny days is ample. When the weather is dull, run dry, and mildew will not make its appearance on your premises.

The Army Worm must be closely watched for now. In the day he bores in the soil at the foot of the plant; at night he varies it by boring the buds; and the poor grower he bores all the time.

C. TOTTY, N. J.

## The Fruit Garden.

**Blackberries.**—Cut out the old canes and tie the new wood to the supporters, if any. The growth being rather refractory to handle, it would be better if some inconspicuous yet convenient part of the ground could be given up to them where they could enjoy a heavy mulching all summer that would also keep down small weeds. I am not sure that pruning of the blackberry is necessary other than to cut away weak growths and old canes. My experience this summer has again convinced me that double the quantity of berries and those of as fine a quality can be obtained from the unpruned bushes, as from those pruned in the orthodox style, providing plenty of mulching or water can be had.

**Grapes.**—Where the fruit is within 18 inches of the ground, a light mulching will keep all clean even if bagged. They will look more respectable to the visitor too.

**Supporting Fruit Trees.**—This will be necessary work if the owner takes any pride in his garden. It is not always convenient to obtain the right kind of stake for the purpose, and when such is the case it is possible to get along fairly well by using binder twine. A peach tree, for instance, seldom has a main central branch, so we tie two of the central opposite branches together, near the top, then tie another pair or two opposite in the same way, making thus four or six starting points and continue on outward and downward to the bottom or lower branches where needed, forming, if you like, a crude spider's web, lacking acenter. Taking care that all ties or loops are loose about the branches, and start from just below the loop from above.

A more convenient way, if a long strong pole is at hand, is to put it in the ground six inches, and bind it to the trunk and start the tying from that. By using a little time at this work, there are no unexpected splits and regrets about your best peach and plum trees.

Looking around, I don't see a more handsome tree in sight just now than a small one of *Wealthy*, trunk 2½ inches in diameter, height 10 feet, fairly weighted down with glowing dark red fruit, rather flat in shape, 2½ by 3½ inches; by the way, this apple is described as being in season from December to February; queer that now they are practically ripe here.

**We Have Now** in use for table, *Rivers* and *York peach*, *Bartlett* and *Buffum pears*, *Gravenstein apple*, and *Imperial Green Gage plums*. *Doyenne Boussock* pear makes a fine one for market, and cooking purposes and is one of the trees that bear well every year.

JAMES HOLLOWAY, N. Y.

Investigations made by the Department of Agriculture show that the pith of the Sunflower stem is the lightest substance known, with a specific gravity of 0.028, as compared with 0.09 elder pith, which has heretofore been considered the lightest of all materials. The specific gravity of reindeer hair is 0.1, and of cork 0.24. Cork has a buoyancy of 1 to 5 in its use in life-saving apparatus at sea, and reindeer hair is rated at 1 to 10. The world's visible supply of reindeer is limited. The demand on the cork tree, too, is rapidly increasing, owing to the development of the world's thirst. Thus it is that the discovery that the buoyancy of sunflower pith is as 1 to 35 is of some consequence. There is no scarcity of sunflowers.

## Some New Boilers.

Greenhouse heating is perhaps the most perplexing of the many problems that confront the practical and amateur gardener, because without adequate heating power during wintry weather, all knowledge and skill in plant growing amounts to naught. Therefore a talk about boilers and heating now, at the time when all who have glass erections, are, or should be, making their preparations for the coming winter, is seasonable.

American Gardening opens the subject with illustrations and remarks from the most expert manufacturers in the line, and introduces views and descriptions of some new patterns from the famous Irvington firm, whose reputation for more than 20 years has been of such a nature that further comment is unnecessary.

The Lord & Burnham Company of Irvington, N. Y., and 160 Fifth Avenue, New York City, is bringing out some new boilers adapted for heating greenhouses and residences. The Standard boiler has been on the market for 20 years, but recent improvements to increase its efficacy have led to the construction of an entirely new set of patterns, in which an increased fire surface is provided, as well as a fire travel which is designed to extract the principal heat from the pro-

Another new boiler of the sectional type is shown in fig. 177, which is a broken view showing the construction, the fire travel, and the arrangement of the heating surface. The sections are united by means of a machine-finished surface, into which small grooves are milled, which are brought up tight against asbestos gaskets by means of a long tie rod running through the sections, as shown, which, it is said, secures a perfectly tight joint with little labor. The intermediate sections consist of a water leg forming the side of the ash pit and fire chamber, and at a sufficient distance above the fire line to permit of an ample combustion chamber, and three slanting waterways, one above the other, the bottom one being the smallest and the others increasing in size, run from the side water legs and connect with a central column which runs to the top of the boiler. This construction permits of an unrestricted upward circulation and an internal circulation. It also permits the direct impingement of the fire on all of the slanting waterways, and has the effect of increasing the size of the combustion chamber so that the gases may be thoroughly ignited and consumed, all of which tends to increase the power of the boiler. At the back of the boiler a diving flue is formed by two solid

## Forest Lands as Parks.

Where you have the natural forest, every move made to smooth and clean up the grounds means the death of more or less of the trees. It is only a question of time when you will lose all that portion from which the underbrush has been removed. To prevent such calamity, constant attention should be given to introducing young trees in with the older ones, which must surely die. To keep up a plantation requires constant renewal, some being replaced every year or two, or five or ten, or fifty, or one hundred years. We suppose this ground is to be kept for this purpose forever, and it will be a constant renewal of material there.

The history of the forest is the same everywhere. In almost any primeval forest on flat or slightly rolling land, the melting snows make the grounds swamps every spring. The accumulation of leaf mould retains that moisture at the surface. The roots lie near the surface, giving practically surface trees. All leaves that fall should, therefore, be left upon the ground; there is nothing else that can take the place of that mulch of leaves or similar material. To cover the roots of many of our trees with soil is to kill them.

The Beech is particularly susceptible

FIG. 176.—LONGITUDINAL SECTION OF STANDARD BOILER.

FIG. 177.—BROKEN VIEW OF NEW SECTIONAL BOILER.

ducts of combustion previous to their exit. Fig. 175 shows a vertical section of the boiler, looking towards the front, from which it will be seen that a large surface is exposed to the direct radiation from the fire. In fig. 176 the fire travel is shown, the gases rising from the fire at the front of the boiler, and passing under a thin, flat, horizontal water chamber to the back of the boiler, where they rise again and pass under the dome of the boiler to the smoke outlet at the front. This construction provides an ample combustion chamber and a sufficient depth of fire chamber to permit of a sufficient body of fuel to carry a fire through long winter nights. The flow and return connections are made by means of flange joints, so that the heater may be readily disconnected for making changes. The grate is of a construction to be readily operated and at the same time promote combustion by permitting a free entrance of air to the fire. The boiler is made in four sizes, presenting respectively 2, 2½, 3¼, and 5¼ square feet of grate surface, and rated to carry, 450, 650, 1,050, and 1,850 feet of 4-inch pipe, which is approximately equal to the same number of square feet of surface in the form of radiators. Two larger sizes of the heaters are arranged to be set in pairs, when they are rated to heat from 2,100, 2,700, and 3,800 feet of 4-inch pipe.

water sections, a flue and damper being placed in the rear section so that a direct draft may be effected to facilitate starting the fire. On closing this damper the products of combustion must dive to the bottom of the boiler before they can rise and reach the smoke outlet at the rear. It is pointed out that the boiler presents a large amount of direct heating surface in proportion to grate surface provided. Large doors are provided in the boiler for removing any accumulation that may form on the surfaces of the boiler. A grate is provided of the labor-saving type. The pipe mains may be connected at either or both ends of the heater, as desired, by means of flanged elbows. It is pointed out that the boilers may be used successfully with any kind of fuel. They are made in four sizes, composed of 9, 10, 11, and 12 sections, and have respectively 10, 12, 14, and 16 square feet of grate surface, rated to carry 3,500, 4,200, 4,900, and 5,600 feet of 4-inch pipe. Where large capacities are required the boilers are adapted for double connections, when they are estimated to heat double the amount of surface given above. An eight-page circular giving full descriptions, illustrations, dimensions, and ratings can be secured on application.

Our publishers will supply any book wanted. Send your orders.

to such treatment. The root grows along with half of its diameter out of the ground and under an old Beech tree you are continually tripping over the roots. Wherever there is a break there will be a sprout. The breaking of the roots seems to be like the breaking of the trunk, and it is probably for that reason it will not bear covering.

I do not think that even where people are passing it is well to protect the roots with a covering of sand, but that leaves are all that is necessary; or in their absence a straw or straw manure could be used. I do not think the bruising with shoes is as bad as covering with soil. It is injurious, I suppose, to have people stamping around, but I think of the two it is less harmful than covering the roots. It is like putting an impervious plaster on a man's skin. The underbrush and trees in any part are mutually essential. —J. F. COWELL, Buffalo, N. Y.

## Peach Diseased.

(To F. A. T.)—The specimens are affected with brown rot (Monilla) for which the only known remedy is the destruction of all diseased fruit.

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1904.

PUBLISHED BY

A. T. DELAMARE PTO. & PUB. CO. LTD.

ROSE AND DUANE STS.

RHINELANDER BUILDING, NEW YORK.

Telephone, 3154 Cortlandt.

P. O. Box 1697.

REGISTERED CABLE ADDRESS

Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

\* \* It is earnestly requested that all correspondence arising from articles appearing in our columns be addressed to THE EDITOR at the office of this paper and NOT to the authors or signatories concerned. A matter that will interest one person, so that he will desire further information, will doubtless interest others. Our columns are open for discussions.

**BY** the title Village Square The Village Square is meant a space which is to be treated as an ornamental garden or small park area, and as such could with equal propriety be named a city or town square. It is in fact a development of the building scheme of the place, and if properly carried out, serves to very greatly enhance adjoining property values. This is a material gain not to be forgotten, but there is another equally important feature that applies strongly in the more densely populated areas, that of affording a breathing space in the midst of the conglomeration of brick and stone.

The work of beautifying a town is too often neglected by the governing authorities, and except when an energetic Improvement Association is operating, posterity has to lament the selfish greed of its ancestors, in that for a fancied immediate gain in dollars and cents the aesthetics of town construction have been

sacrificed, or so placed that their recovery is attended with great difficulty, and sometimes enormous expense.

It is a healthy sign in the majority of rising townships of to-day that provision is being made for small park areas, as they are called. For our own part we would prefer to confine the term park to the larger tracts of land, designating these smaller spaces as town or village squares.

The possibilities of treatment which these two areas offer to the landscape gardener are entirely different, and more skill is requisite for the proper handling of the smaller area. The restricted area usually offers no great natural effects that can be seized upon by the artist, as is often the case in large parks. In the city square the effect has to be made absolutely; it is a creation. The mere dotting of trees here and there, displaying chiefly their trunks even with gracefully winding walks, is not enough. Again, the common error of outlining the whole with a bank or solid mass of greenery, however designed, is to be severely condemned.

A city square is a part of the town itself, and as well as serving as an open area for repose of the weary, should present from all the surrounding streets and buildings pictorial effects equally as beautiful as those that can be seen from the inside. With this object in view, the plantings should be blended into those that are on the streets in the form of shade trees. How to arrive at this result is beyond our present province, the matter is best demonstrated by a plan, and in our next issue we intend to give such an one which has been specially prepared for American Gardening by Mr. J. Forsyth Johnson. This plan will show a village or city square, in which provision is made for a pavilion, band-stand, Water Lily pond, and promenade. The plantings will be designed to be of a permanent nature, with no "bedding out," thus avoiding what is always a very heavy drain on the finances of a small community. If such planting be desired, however, there is ample space where it may be indulged.

The plan to be given will prove of great value to all improvement associations and can be easily adapted to suit any situation or condition.

## Big

### Strawberries.

Many have tried to do so, and the majority have failed. A man who for a score of years has produced the best berries sent to the New York market is certainly capable of teaching others, and we have therefore great pleasure in announcing that Mr. Jerolaman, who has this enviable record, has contracted to write for American Gardening exclusively, his methods of culture and begins this week by giving the first part of an autobiography.

A letter from Mr. Jerolaman in a recent issue of American Gardening has caused the strawberry experts of the country to enter into correspondence, and the interest evinced has resulted in the present series of articles. Mr. Jerolaman has been frequently sought before for information, but never yet have his methods been laid before the public.

## Fruits Received.

**A New Plum.**—Samples of a seedling plum were lately received from M. J. Graham, Riverside Nursery, Adel, Iowa, who writes concerning it as follows:

"The new plum of which samples are sent you, originated with Henry Hunt of Dallas County, Iowa, some ten or twelve years ago. These specimens are not over two-thirds normal size, as they have ripened during a protracted drought, and the trees stand in hard ground without mulch or cultivation.

"It was grown from seed of the Wild Goose plum, supposed to have been pollenized by the Lombard, as a tree of the last-named variety stood quite near the tree of Wild Goose, from which the seed was taken.

"In the same vicinity also grew a tree of a large native plum brought from the woods, the fruit of which closely resembles the De Soto plum in size and quality. This is a true *Prunus americana*, and it is possible that the new plum is the result of a cross between the wild plum and the Wild Goose. The fruit of the new plum averages larger than the Wild Goose when grown under same conditions, and is far superior in quality.

"The tree is perfectly hardy, is very productive, and does not split down like the Wild Goose tree.

"The fruit ripens soon after the Wild Goose, and before the *americanas*, thus coming on the market when it is bare of really good fruit.

"Mr. Hunt has heretofore called my attention to this plum, but not until he brought me a jar of the canned fruit did I fully appreciate its work. 'The proof of the pudding is in the eating,' and for culinary use we claim this plum superior to any heretofore introduced."

The fruit, as seen by us, is roundish oval, 1½ inches in length; cavity, shallow; suture, very shallow and distinct; apex, slightly elevated; skin, red, with slight bloom, covered with numerous dots; flesh, yellow, tender, juicy; stone, flat, 1x½ inch; flavor, sweet. A very pleasant eating plum.

**Champion Peach.**—Fruits of this have been sent by C. A. Baird, Baird, N. J. The fruit is heavy, of fair size, yellow, flushed red. Flesh white, juicy, flavor sweet, not aromatic; a refreshing peach for eating out of the hand.

## Lime Wash for Scale, Etc.

I have tried common lime-wash, and tried it so successfully for the past forty years that I have not tried anything else, says William Saunders, superintendent of the grounds of the Department of Agriculture, Washington, D. C., and not only for fruit trees, but for all sorts of trees; for instance, trees in cities frequently become somewhat stunted in growth and covered with the bark-scale. When a case of this kind is encountered the trees are headed back during the fall, and small twigs removed and the whole body and branches covered with lime-wash, which effectually cleans them. Orange trees when attacked are treated in the same way, and with the same result.

A grapevine becoming infested with mealy bug had, after pruning, the entire wood, old and young, covered with the wash, and the bugs were exterminated. Last fall I came across an old *Opuntia* in an out-of-the-way corner, which was entirely covered with scale. It was completely covered with the wash, and is now perfectly clean. The wash flakes off and the scale insects with it, smothered to death. In fact, any plant with bark-scale is cleaned and cured in this way, so that a boy with a bucket of whitewash is our cure-all for scale.

One effect of the new tariff will be to increase the cutting of native forests, the Canadian timber being practically excluded by the duty of \$2 per 1,000. This is protection of a wrong kind. Preservation of the forests is a national necessity.

## Big Berries for All.

Being the Cultural Methods of Henry Jerolaman, the Strawberry King. Preceded by an Autobiography.

I will first give you a short sketch of my life in order that your readers may know something as to what manner of man it is that attempts to instruct them in strawberry culture. Commencing with the records, I find in our old family Bible, that I was born on the 14th day of November, 1834, at Peapack, Somerset County, N. J., in the center of a lime stone district, not because of any particular desire on my part at that time to be born in the center of a limestone district, but as I have always believed it was entirely owing to the fact that I happened to be there at that time.

Let me here state that lime stone or lime is one of the very best materials to sweeten wet, sour, and heavy lands; also a word about the above record. In after years, in trying to find out on what day I was born, being afraid it was on Friday, I spoke to my father about this record. His reply was: "Henry, I never bothered about putting down any little thing. I waited until I had a whole lot, then I got at it, and put you all down together; it might have been three or five years after when I set it down. I know I figured you all out; there was about two years between you all and I guess I got you down about right." From this it will be seen that my father had a method—most farmers have!

Being very young at the time I was born, my father had no use for me, and my grandmother took me to live with her, and when I was old enough, she sent me to the Old Stone school house that stood upon the bank of the mill race on one corner of her farm. In the old stone school house I received a very common and unfair education, for my grandmother said that she paid out \$3 per quarter for my schooling, and could never see the worth of her money in me.

When about ten or eleven years of age, I began to play what the boys now call "hooky," that is, would get off very early in the morning for school, then slipping off to some of the farmers, plant or hoe corn all day for 50 cents. The teacher going to see my grandmother in order to find out why I was absent from school, found out all about it, and told my father, who as soon as he saw that I was getting useful, moved me to his farm, which was midway between Mendham and Peapack, in Morris County. My father was a very good and kind father, if you let him have his own way—much better than the general run of fathers that get themselves into the newspapers, and of whom you read. He was known throughout as the man that owned one of the largest (about 300 acres) and the rockiest farm in the country; and also as the man who always planted 60 acres of corn, 60 acres of oats, and 60 acres each of wheat and rye, not having fertilizers enough for a single 10-acre lot. He also was famous for keeping just enough old horses to eat up nearly all that he did grow. My father ran a great many things all at once, or a good many things ran him, I never could find out which way it was. He had a grist mill, a saw mill, a cider mill, and still house, and I do not remember his ever finishing anything that he ever undertook. Yet he was always very happy and had plenty of time for fishing, hunting, etc.

Working very hard on this rocky, worn-out old farm until I was about 15 years of age, getting up in winter each night about 12 o'clock (midnight). In order to drive to Newark, good 25 miles each way from the farm to sell a load of oats or corn or what little grain we had to sell, arriving in Newark about sunrise, selling the load, resting the old horse at Doyle's Hotel, foot of Market street, at near noon hour I would start for home, arriving there each day about sundown, making the 50 miles each day and night. For every other load I took a fresh pair of old horses, and even this was pretty tough on the horses, but my father never gave me a thought. This was kept up for three or four years or until I was 15 years of age, when finding out through

my mother that my father never made or laid up over \$100 per year after he paid all his debts, I set to thinking.

One day one of our neighbors, a Mr. Ballantine, calling to see my father, drove under the wagon house on one side of which was a corn crib. I happened to be present, and thought I had a good chance then to give my father some advice. I began by saying: "Father, why do you not do as Mr. Ballantine does, plant only 10 or 12 acres of corn, feed it well, and have two cribs full of corn instead of only (pointing to our crib) one crib half full of nubbins?" Mr. Ballantine laughing angered my father, and as I did not charge father anything for this advice, he charged me with an old black horsewhip. I got out first and jumping over the fence into an old peach orchard I made good time for the other side, my father being a close second. Arriving at an old worn fence, I caught it before I got to the top, but when I did get out of reach I shouted, "Father, I will live to see the day when I will get more off a single acre than you get from your old 300 acre farm," and I am happy to state that my father too lived to see the prophecy fulfilled, and was pleased to acknowledge it to me.

After and for the past 24 years, I have made more from a single half-acre than my father did, as he afterward told me, in any one single year from his whole farm.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multiplicity of counsel there is wisdom and safety. Write us often.

**Use of Hydrocyanic Acid.**—I was much interested in the article of B. T. Galloway in *American Gardening* of August 21, page 585, on "Injury to Violet Leaves." Will Prof. Galloway please state through *American Gardening*, how he prepares and uses the hydrocyanic acid gas? And will it injure any other plants?—THOS. L. CONE.

**Crops in Oklahoma.**—The grape crop of Oklahoma is now about harvested, and the yield has been the largest on record with correspondingly low prices. Excellent Grapes could be had in wagon-load lots at 1½ to 2 cents per pound; much wine has been made where good shipping facilities did not exist. At the Oklahoma Experiment Station where more than 200 species and varieties are being tested, the crop was very satisfactory.

Shipments of Peaches have been larger than ever before, large consignments being made daily from Oklahoma City. The yield has been enormous and part of it is being worked into brandy by a recently established distillery at Guthrie. Prices varied from "if you pick them, you may have them" to a dollar per bushel.

Oklahoma watermelons bring special prices in Western markets. Lawrie is the principal shipping station where about 2,000 acres in the sandy ridges along the Cimarron River are planted almost exclusively to watermelons and cantaloupes, the soil being especially adapted to them. The industry, however, is an important one all over the territory.—JOHN FIELDS.

**Tomatoes Eclipse and Nicholson's Hybrid.**—Replying to J. C. who asks in your last issue (page 603) where he can obtain seed of Eclipse and Nicholson Hybrid Tomatoes, I would say that he can procure the last-named sort from R. and J. Farquhar & Co., seed merchants, Boston, Mass., who are the only firm cataloging it so far as I am aware. Eclipse originated with a Glasgow (Scotland) firm, and cannot be procured here. If "J. C." will forward me his address, I will, however, be pleased to send him a few seeds of this variety and of Comet, another first-class imported tomato.—W. N. CRAIG, Taunton, Mass.

## Jadoo Fibre and Liquid.

To the Editor of *American Gardening*.

The workings of the human mind are similar among all the sons (and daughters) of Adam. We read an advertisement for months, for years perhaps, without taking in its full signification. Suddenly we are seized with the temptation to prove the merits of the advertised article, and we send our order forthwith. The above bit of philosophy is introductory to the story of an amateur's experience with Jadoo fibre and Jadoo liquid.

The word "Jadoo" was graven on my mind from having seen it in this paper every week for months. In the early part of July the thought struck me suddenly that I ought to give it a trial. I sent for a 120-pound bale of the fibre and a 2-gallon can of the liquid. Just at the time I received them, I also received from Costa Rica some tubers of fancy Caladiums, which a friend sent me, thinking they were something indigenous to that country. Packed in wet sphagnum, they had made during their two or three weeks' journey a frail, sickly growth of about three or four inches. Two of the tubers were planted in rich soil and four in the Jadoo fibre. Those planted in the fibre immediately grew, the sickly white growth changing quickly to healthy green, handsomely spotted leaves. Those in the soil made no additional growth, and finally died down entirely. I thought they were dead, but they sprouted again, and are now growing well, but not so freely as those in the fibre.

A *Latania borbonica* had been perishing for years from inanition, or some other occult cause, until it had dwindled down to nothing, and naught but a single point of green could be discovered. On shaking it out of the soil, I found that every trace of root was gone. I immediately potted it in the fibre. It picked up from that moment, and while the improvement is so slow as to be almost imperceptible, yet it really has made a new growth of at least two or three inches. My hired man is exceedingly pleased with it as a potted medium for Ferns.

The cost of the fibre renders its use impossible in the open border, although I wrapped the roots of some *Crotons* and *Geraniums* in it and planted them in the ground in the same bed as others. I cannot say that I notice any advantage in so doing.

The Jadoo liquid appears to be remarkably concentrated, and it must be diluted with water forty-eight times. This I have used about twice a week for plants in the open ground, in tubs, and in pots.

Conditions vary so much in gardening, that it is impossible to attribute to any one cause given results. My opinion is that for *Roses* in open ground this liquid is very beneficial. For soft wooded plants and those grown in pots or tubs, there seems a possibility of its turning some of the lower leaves yellow, even diluted as freely as above. Whether that result with tuberous *Begonias*, *Abutilons*, and some other plants, was due to the use of the liquid or to other causes, I cannot positively say, however.

My feelings in the matter may be summed up as follows: Every plant that I have in the house this winter shall be potted in Jadoo fibre. It is clean to handle, light in weight, and will no doubt obviate bringing into the house many eggs of insects found in garden soil. Retaining moisture, it obviates the necessity of watering so often. As it never bakes or gets matted, all my seeds shall be sown in it in the spring in boxes. For this purpose it is necessary to sift it. Amateurs should give it a trial. Perhaps more anon on this subject.

L. C. L. JORDON, N. J.

A movement is on foot for the reorganization of the old Larimer Co. (Colo.) Horticultural Association, which for a number of years was very successful. A meeting of Larimer County fruit growers was held on August 21 in the District Court room, Fort Collins, for the perfection of the organization.

## Diseases of Shade and Ornamental Trees.\*

By B. T. GALLOWAY AND ALBERT F. WOODS.

(Continued from page 573.)

### GASES AND OTHER POISONOUS SUBSTANCES IN THE SOIL.

Asphyxiation of the roots of trees is sometimes produced by illuminating gas which has escaped from some nearby gas main. It probably also acts as a direct poison. Diseases produced by other poisonous substances in the soil or by too great concentration of substances not poisonous are too rare to warrant their treatment here. The injuries from escaping gas can be remedied only by stopping the leak, and after removing as much of the old soil as possible filling in with fresh, rich earth.

### DISEASES DUE TO ATMOSPHERIC CONDITIONS

As already pointed out, no sharp line can be drawn between the diseases due to conditions of the soil and of the air. As a matter of fact, a weakened state of the tree, due to certain conditions of the soil, will make it all the more liable to succumb to atmospheric influences. Again, it may happen that very favorable conditions of the soil may start growth at a time when it might be injured by cold or other conditions of the atmosphere.

#### DESICCATION, OR DRYING OUT.

Young leaves and sometimes tender shoots which have pushed out during a spell of cold or cloudy, moist weather frequently wither and die when suddenly exposed to bright, hot sun. This is ordinarily called sun scald. It is not, however, a true scalding of the tissues, but is due to the fact that the latter lose water more rapidly than they can obtain it, and so wilt and dry out beyond the power of recovery. The excessive loss of water is brought about mainly by the leaves produced in very moist air not being adapted to resist excessive evaporation, even when there is an abundant supply of water in the soil and in the main parts of the plant. The trouble occurs more often in spring, when growth is rapid, and cloudy, moist days are followed by hot, dry ones. Later in the season the death of the margins and tips of the leaves of a great variety of trees, shrubs, and other plants is often observed. This is especially noticeable when a rather moist spring, favorable to growth, is followed by dry and very hot weather. Trees making a poor, stunted growth, suffer most, although any tree is liable to injury if the right conditions prevail. In parts of the West and Southwest the disease described is produced in a very short time by hot, dry winds, which sometimes sweep over the country. Frequently the leaves are literally cooked, but oftener the edges wilt, turn red or pale yellow, and then dry up.

Desiccation may also occur in the winter; in such cases parts of the tree or even the entire tree may be killed. Evergreens, especially Pines, are frequently seriously injured from this cause. A few warm days, occurring at a time when the roots are frozen or when the ground is so cold that it hinders root action, cause the needles to turn reddish yellow and to fall. Frequently only the tips of the needles at the ends of the branches are affected, and again young and exposed trees may be thoroughly dried out and killed. Cold, dry winds may bring about the same effects as warm ones with sunshine. Any condition, in fact, which will cause a more rapid evaporation of water than the roots can supply, will, if continued a sufficient length of time, eventually result in the injuries described.

Preventive measures.—In cases such as have been referred to it would be difficult to carry out remedial measures. In most instances the injuries are done before any steps are taken to prevent them, and of course it is then too late to save the tree or the parts of it that may have been injured. The efforts of growers, therefore, should be largely toward keeping the trees in such condition that the

injuries may be prevented. The means of preventing summer desiccation, while simple in themselves, are not always easily carried out. In cases where the injury results from imperfect root action owing to soil conditions, the latter may be changed by drainage, by cultivation, and in other ways by which more air is given to the roots. If the soil is too dry, as is often the case, its water-holding capacity may be improved by proper cultivation, by the addition of organic matter or humus, by mulching, etc. Top-pruning in dry seasons will often check the excessive demand for water and thus prevent injuries to the remainder of the tree. At present there seems to be no practical way of preventing the sudden damage which may be done by hot winds, except by copious watering of the soil, and even this may not always prevent serious injury, owing to the rapid evaporation at such times.

In the matter of preventing the winter "blighting," or drying out, of evergreens, every effort should be made to keep the roots in such condition that they can respond when a demand for water is made upon them. It is evident that if the soil is well dried out when winter sets in injury will result whenever the conditions already described prevail. When practicable, therefore, liberal applications of water to the soil may enable the trees to successfully pass through winters which, if such precautions were not taken, might prove injurious. Liberal mulching with straw or manure may also prove beneficial both as a conservator of the moisture and as a means of preventing the ground from freezing too deep and hard.

The most trying time for the trees is when they are young and small, that is, before the roots have extended very deeply into the soil. At very little expense, however, such trees may be protected from both wind and sun by straw.

#### EXCESS OF ATMOSPHERIC MOISTURE.

During periods of long-continued rains or fog, evaporation from the leaves of trees is slow, and as a result the entire plant becomes charged with water. One of the results of this is an unusual mechanical stimulation of growth, and this growth is increased by changes in the cell contents, which give the cell in question an abnormal attractive power for water. Under these conditions nutrition is interfered with and the growth produced is thin-walled, unhealthy, easily dried up, and a ready prey for insects and fungi. Older parts of the plant are affected by these conditions in various ways, one being the production of little warts and swellings by the abnormal growth of cells, as described above. These may appear on leaves or stems, the tissues of which still possess some power of growth.

It often happens that leaves in the diseased condition described become water-logged in spots. This is especially common where two leaves are stuck together with a film of water, instances of which have been observed this year on the Norway, the hard and the soft Maples, as well as on various other trees and shrubs. The close contact of the water with the cells of the leaf is very favorable to its absorption. Wet, translucent spots appear, especially around any little injury like the puncture of an insect or tear in the leaf surface. The presence of this water between these cells cuts off their supply of oxygen, and consequently they soon die and turn brown. The same trouble occurs when the leaf surface remains wet for twenty-four to forty-eight hours, even though not stuck to another leaf. The conditions about Washington, D. C., for example, have been unusually favorable to this trouble during the present season. In early spring vegetation was at first a little retarded by cool weather, but this was suddenly followed by good growing weather, during which the leaves of most trees and shrubs, especially those of Norway Maples, pushed out with great rapidity. This latter period was followed by one quite dry and warm, during which red spiders increased to unusual numbers, particularly on the lower and more protected leaves of the crown. After this came a period of several days of rainy weather, and many of the spiders were

washed off, but the leaves where they had been working became water-logged, as described elsewhere. The Norway Maples and Horse Chestnuts suffered most, the leaves of these trees in many cases appearing to have been scorched by fire.

Preventive measures.—Water-logging and other injuries resulting from an excess of moisture in the air are not easily prevented; in fact, it is questionable whether anything practical can be done in such cases. However, trees can be made much less liable to such trouble by proper care in planting, feeding, etc. As already described, such trees as Norway Maple and Horse Chestnut, which are peculiarly susceptible to injuries of this kind, require special care, and it is a question whether it would not be best in the end to discard them entirely where the conditions are such as to make it almost impossible to keep them in health.

#### LOW TEMPERATURES.

The injuries from freezing are closely related to those brought on by desiccation. In fact, freezing of the tissues is a drying out of the water which they contain. If the tissues are dried beyond the point where they are able to again take up water, they are killed.

In a state of maturity and rest most of our trees and shrubs, indigenous to regions subject to frosts, stand freezing without the slightest injury, provided they do not thaw out too rapidly. In case of plants introduced from warmer climates, however, all degrees of ability to withstand cold are to be found, some being killed by the slightest frost, while others appear to adapt themselves readily to the changed conditions and withstand quite severe freezing. The fact that trees, especially exotics, growing in wet situations are more easily injured by cold than those growing in drier places, is probably because the former do not mature their growth, while the latter do to a great extent. This is true also as regards the more succulent parts of plants, which are notably more subject to frost injury than the drier portions. Smooth-barked trees sometimes have their trunks and larger branches injured on the southwest side during winter, the injuries being characterized by the death of large patches of bark. During the latter part of winter, and early spring, when there are periods of several days of warm weather, the cambium on the south side of the trunk and larger limbs stimulated to premature activity. If the warm spell is followed by cold, freezing weather, these partially active areas will be killed, after which they gradually dry out, the bark, young wood cells, and cambium shrinking. After a time the bark separates from the wood and finally splits. This may not occur until pretty well into the summer months, and may not then be evident except upon close examination. During rains these portions become water-soaked, various ferment and decay-producing fungi gain entrance, and the rotting of that part of the trunk begins, extending rapidly from year to year, until the tree either blows over or is killed.

(To be continued.)

#### Double Petunias.

I got some seed of Double Giant California Petunias. Some plants come double, very ugly, and some single; but all are small. I have them in woods dirt and well decayed horse manure, almost half an inch. They do not suffer for water.

What should I do to develop size? Some seed of single white Petunias I got for five cents a paper are nearly double the size of these.—H. C., Ont.

—Possibly the season has been too wet and cold to properly develop the largest doubles. Anyway, singles are always more satisfactory outdoors.

The Manhattan (Kansas) Horticultural Society held their August meeting at the home of Mr. C. G. Howard. Mr. W. J. Griffing read a paper on "Profit in Horticulture," and Mr. F. A. Mariatt talked about "Autumn Insects of Economic Importance to the Horticulturist." Mr. Griffing thought that the profit was pretty small with grapes at one and a half cents a pound for good table grapes.

## Strawberry Growing.

### He Claims Crankiness.

To the Editor of American Gardening.

Permit me to heartily thank Mr. E. W. Wooster of Maine for referring to me as "a little cranky" (page 587.) I am not only cranky but a combination of cranks. I even confess to being a stickler for many small details not noticed by the average fruit grower.

I understand a "crank" to be a person who finds an effect and keeps things turning until he finds the cause, and then makes good use of that cause. For a want of knowledge of this "cause," our markets have been glutted with fruit which people do not care to eat at any price.

For the last few years fruit growing has paid far better than any other branch of agriculture, and the "cranks" in the business will find it the most profitable for many years to come. Hundreds have gone into the berry business with the idea that it was a question of broad acres. There are men who have set out several acres when they had not facilities for manuring and cultivating one acre. Extensive general farming may do, but it is the prime cause of numerous failures in fruit growing. Intensive horticulture only pays now. Last spring I set out 39½ acres of Strawberries, but then I am a crank and things are turning nicely.

A year ago all this ground was sown to cow peas. They made a wonderful growth and were turned under in October. Then during the winter we went to Chicago stock yards and loaded on the cars nearly 1,000 tons of that grain-fed, thoroughly rotted, almost clear dung, besides a very large amount gathered here in the city. It was carefully spread as drawn, so the winter rains would wash it into the soil. We also added a good dressing of wood ashes and ground bone.

This spring the spading and Acme harrow and roller went over it sixteen times. I hired extra teams, and my men said I was a crank on manure and cultivating. Then I went for those "cranky plants" and set every one as carefully as if there were only a dozen to be handled. We trust no one except the foreman who stands behind the gang of men and sees that every plant goes in just so.

As quick as the men had made a round the twelve-tooth Planet. Jr. started and has gone over the ground every five days since. A gang of ten to twenty men drilled to handle a hoe as skillfully as a soldier would a musket, go over the ground ahead of the cultivator and remove every weed and loosen up and fine the soil directly around the plant, and the cultivator following, loosens up their tracks so the entire surface is covered with a fine dust mulch. Every plant is treated as tenderly as if it were a nursing babe.

We have had plenty of rain all summer, but it would have made no particular difference if it had not rained at all. The black nose of a 6-inch iron pipe sticks out of the ground at convenient places. The other end of the pipe is 1,200 feet away, attached to a centrifugal pump capable of sending more than 1,000,000 gallons of warm river water to any acre on the farm in ten hours, where it is distributed by flooms and ditches in the most approved fashion known to irrigation.

Of course all this costs money; but being a crank and turning things so we sell everything for enough more than common fruit to pay our entire expenses and sell in advance, we can afford to have these things.

Come over to Michigan next June, brother Wooster, and see what an old broken-down soldier has done by being cranky. We run a free 'bus and free "hotel" to all visiting berry growers. I believe the visit will change your faith in some things.

R. M. KELLOGG, Three Rivers, Mich.

The superintendent of the greenhouses of the Pennsylvania Railroad at Altoona has been instructed to propagate 150,000 Ivy and Virginia Creeper vines for use along the lines of the railroad in embellishing and ornamenting the rocky and other cuts.

## Some Questions Answered.

### Windbreaks.

The nicest place for a flower garden is a strip about 100 feet from north to south and 150 east to west. On the north is a row of maples forty years old, on the east two large walnuts, and on the west a hedge of large evergreens between this strip and the drive. There is grass inside all the trees leaving the plot the size given. What would be best to break the force of the north wind coming under the maples? A trellis covered with Roses or Clematis, or what? Or would it be best to abandon it as is being done? The land is stiff and heavy and has been used for vegetables for 40 years till just lately.—H. C., Ont.

—The question suggests a great possibility for a handsome trellis either of various Roses or singly Crimson Rambler, or better still, a combination of the last-named, with Carmine Pillar, Bardou Job, and several others. Or a permanent bank of shrubs could be used.

### Fertilizers.

How much barnyard manure and how much and what kinds of commercial manure would it be practical to use on one-tenth of an acre of pretty heavy land? The subsoil is heavy clay from one foot to 18 inches down?—H. C., Ontario.

—Two to three tons of stable manure would be a safe application. Two tons worked in properly, and later a dusting of lime on the surface should make the soil rich enough for ordinary purposes.

### Greenhouse Building.

(To H. C., Ont.)—From the few details furnished, it is hard to give advice, and it seems as though the only practical solution is to build a small veranda. The exposure is such that a large number of plants other than Roses would thrive. Perhaps with more particulars, elevations, etc., we may be able to furnish more information.

### Ladybirds.

(To J. H.)—The very small blackish insects are those of a little ladybird which is usually found upon trees infested with scale insects. It is beneficial and should be protected.

### Insects on Strawberries.

(To A. C. J.)—The small circular holes on the strawberry leaves have been made by the strawberry slug (*Emphytus maculatus*). It is the larva of a four-winged fly and is pale green in color, about three-fourths of an inch long. The change to the mature insect takes place in the ground. Paris green is an effective remedy.

### Spider on Lemon Verbena.

Is *Eucalyptus citrodora* as much troubled with spider as Lemon Verbena? Spraying with a force-pump six times a day, tobacco water, sulphur, or kerosene, all failed to rout it. Now I turn the plant upside down in a pail of water for hours at a time about once a week, but it is getting rather large for such treatment. I note the carbon bisulphide treatment and wish to try it, but can't just now.—ANNA CRANDON, Ont.

—If the above treatment is persevered in, success must follow; we cannot advise better; spider is cured by moisture. We do not think the *Eucalyptus* named is very subject to spider.

## Obituary.

Erastus Corning, the well-known amateur of Albany, N. Y., died suddenly on August 29, at his home. Mr. Corning, who was one of the pioneer horticulturists of this country, early appreciated the beauties of the Orchid family, and years ago had got together a rich and varied collection. This unique and interesting lot of plants has of late years been much reduced. So great indeed was this gentleman's enthusiasm for the gathering of Orchids that heaven sent out a collector

of his own. Cattleya Trianae Corningii, one of the most beautiful of the almost white forms, was named for him; the name is also perpetuated in *Phalanopsis Corningiana* and *Vanda Corningii*. The collection has been under the charge of the veteran Orchid grower, Mr. W. Grey.

Odgen Goelet of Newport, R. I., died on his yacht off Cowes, England, on August 27. His estate at Newport was one of the most recent and was being developed into a first-rank horticultural establishment, under J. R. Johnson. The range of glass is specially fine.

William Murdoch, one of the pioneer nurserymen and florists of western Pennsylvania, died at Pittsburgh, August 4. Mr. Murdoch was born near Belfast, Ireland, in 1801. His parents were Scotch-Irish. The place was formerly called Hedgerow farm nursery.

Alfred Sutton, a former member of the firm of Sutton & Sons, the well-known seedsmen, Reading, England, died August 7, aged 79 years. He, with the founder, retired some years ago in favor of their sons.

William C. Young, a well-known southern Ulster fruit-grower, died at his home in Marlborough, N. Y., on Thursday night, August 12, aged 80 years. He was one of the pioneers in the fruit-raising business.

Robert McKinstry, a well known fruit grower at Greendale, N. Y., died recently in New York City. He was born near where his orchards were later established, and was 80 years of age. He was a large shipper of apples to Europe.

Calvin S. Goddard died very suddenly on the morning of August 4, at his home in Deering Center. It is thought that his sudden demise was probably owing to pleurisy of the heart. Mr. Goddard had been known as a successful florist in Deering for some 25 years. He originally came from Brunswick to Morrill's Corner as manager of Adams' nursery, and later started in business for himself at his present stand.

Nathaniel P. H. Willis died on August 3, in Chelsea, Mass., at the advanced age of 87 years. Mr. Willis was perhaps the oldest salesman in the country and undoubtedly the oldest in any seed store, having served for sixty-four years, prior to August, 1894, in the constant employ of Joseph Breck & Sons and their predecessors. Mr. Willis was the son of Charles Willis, well known among the farmers at the beginning of this century, and was descended from Charles Willis, of Puritan fame.

Henry A. Gane died at his residence in West Newton, Mass., on Monday evening, August 9. Mr. Gane had always been an ardent and successful horticulturist, and devoted much time to cross-fertilization of *Chrysanthemums*, having produced the Mrs. Jerome Jones, Golden Ball, West Newton, and many others. Mr. Gane was born at Frome, Somersetshire, England, in 1811, and was therefore 86 years of age.

Edwin M. Buswell who died recently was well known to horticulturists in the vicinity of Boston. He came originally from Lebanon, N. H., and was for many years in business in Boston, residing in the suburb of Malden. His love of plant life was inherent, and in his Malden garden it is said that he had at one time perhaps the most complete collection ever brought together in this vicinity of hardy herbaceous plants and shrubs, embracing, as it did, some four thousand different genera and species. From 1866 to 1881 he was treasurer of the Massachusetts Horticultural Society. To him belongs the credit of introducing the *Freesia refracta alba* into the United States, having received it in exchange for some tree seeds sent to the secretary of the Cape of Good Hope Agricultural Society. He was 84 years of old.

**TO LEASE** for a term of years. The land and ten greenhouses, with cottage and stable, also small store attached, where a good business is done in the cut flower trade. 86 Palisade Ave. West Hoboken, N. J., 15 minutes from the Hoboken Ferries. Terms easy to responsible party.

### Situations Wanted.

Advertisements will be inserted under this heading at **ONE CENT PER WORD** each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**WANTED**—A position as gardener and florist on either private or commercial place. English, married, small family. Several years' experience in both America and Europe, best of references. Address **G. R. Mahood,** Box 380, Oimhurst, Ill.

## PRIVATE GARDENERS.

### Appointments and Doings.

*Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.*

### Society of American Florists.

We have received from Mr. Frank H. Child, 242 Thames street, Newport, R. I., a copy of the photograph of the group of members of the Society, taken in that city, August 20. As many of the gardeners throughout the country have friends in Newport, these may be interested in knowing that copies can be procured.

### What the Delegates Consumed.

The following particulars are taken from the Newport, R. I. News and show the amount of provender put up for the S. A. F. on the visit of that body to Newport as told in our last issue.

#### What was Consumed.

40 bushels of clams; 800 ears of corn; 800 sweet potatoes; 400 pounds of fish; 800 lobsters; 1600 clam cakes; 800 rolls; 40 loaves of brown bread; 1½ barrels of crackers; 800 pickles; 120 gallons of chowder; 2 gallons of ketchup; 80 pounds of butter; 40 pounds of lard; 40 water melons.

#### Help and Utensils Used.

9 cooks; 75 waiters; 5 dish washers; 2400 pieces of silver; 1600 plates; 400 platters; 65 large chowder bowls; 300 bowls for clams; 650 vegetable dishes for salt and pepper; 300 water pitchers; 60 small pitchers for drawn butter; 65 ladles for chowder; 800 glasses; 900 yards of tablecloth.

### American Dahlia Society.

We are in receipt of the schedule of prizes for the Society's second annual exhibition to be held in Philadelphia, Pa., on September 21 and 22. The display will be made in the hall of the Pennsylvania Horticultural Society, and under its auspices. The awards in the competitive classes consist of silver and bronze medals and certificates. Intending exhibitors should communicate with the secretary, **E. C. Taylor,** 4827 Main street, Germantown, Philadelphia.

### Responsibility of Delivery.

A decision rendered by Judge McCarthy in the City Court (New York), in *Siebrecht & Wadley vs. Pennsylvania Railroad*, seems to establish the fact that shippers can hold a transportation company responsible for losses occurring through frost and cold where the goods have been subjected to such cold through a delay that was unnecessary, or neglectful on the part of the forwarder.

### Port Chester, N. Y.

The Westchester County Gardeners' Association held its regular monthly meeting at Irving Hall, Saturday, August 28, President Smith in the chair, and 18 members present. The principal business of the evening was the election of new members and making preparations for the forthcoming Chrysanthemum show to be held November 5 and 6. From reports of committees and others, there is abundant reason to expect a very successful exhibition, and that the exhibits will be of a very high order.

The following were elected to full membership: **G. B. Winslade**, superintendent of the Osborne estate, Mamaroneck; **F. Fremd** and **C. Fremd**, nurserymen, Rye, N. Y.; **W. A. Mills**, Port Chester, an interested amateur; **L. McCoy**, Richard Burdell, A. Scott, and Richard Cotterell, of Purchase, N. Y.

Several members made a creditable display of novelties, etc. **G. Draycott**, gardener to **W. H. Parsons**, Rye, N. Y., had superb Coxcombs, 16 to 18 inches over; **W. H. Harvey**, gardener to **Hobart Park**, a collection of Cannas and some grand samples of *Sempervivum* Asters; **A. Grierson**, gardener to **Hicks Arnold, Esq.**, put up a flowering branch of *Polygonum cuspidatum*, also various varieties of *Gladiolus*, including *White Lady* and *Snow White*, and several *Liliums*.

### Riverton, N. J.

The annual reception given by the **H. A. Dreer Co., Inc.**, to the private gardeners and florists of Philadelphia and the surrounding cities, towns and villages, came off on Tuesday, Aug. 31. Fully fifteen hundred people attended, of whom about 1850 went direct from Philadelphia on the steamers furnished by the **H. A. Dreer Co.** The weather was charming, and the visit most enjoyable, everything passing off very agreeably. Particulars of what we saw and heard there will be forthcoming in our next.

### Tarrytown, N. Y.

There are rumors of the breaking up of the many fine estates and their gardens in and about this district. The owners say the assessors of taxes have made it impossible for them to continue longer there. At present, however, nothing is definite.

### Florists' Hall Association.

#### TENTH ANNUAL REPORT OF SECRETARY.

The number of members of the Florists' Hall Association at the close of this report is 705.

The risks assumed are as follows: Upon 2,488,592 square feet of single thick glass. Upon 5,741,098 square feet of double thick glass. An extra one-half insurance upon 136,912 square feet of single thick glass. An extra one-half insurance upon 239,669 square feet of double thick glass. An extra whole insurance upon 356,811 square feet of single thick, and upon 1,122,417 square feet of double thick glass, making it equivalent to a single insurance upon 10,097,209 square feet of glass.

The Reserve Fund consists of \$3,000 in bonds and \$2,215.26 cash in hands of the Treasurer.

The amount of Emergency Fund on hand at the close of this report was \$3,865.79 making the total cash balance in the hands of the Treasurer \$5,581.05.

The Seventh Assessment levied March 1st, 1897, brought to the Treasury \$5,353.68.

The expenditures for salary of officers, stationery, advertising, postage, etc., have been for the year \$796.63.

The sum of \$2,919.13 has been paid for losses during the year: 36,783 square feet of single thick and 6,282 square feet of double thick glass, belonging to members, have been broken during the year.

The percentage of loss has been 1 square foot of single thick glass broken to every 67 1/4 feet insured and 1 square foot double thick glass broken to every 921 1/4 square feet insured.

The special feature this year is that the loss on double thick glass has been unusually small.

The record for satisfactory adjustment of losses remains unbroken, and notwithstanding the universal business depression, the Florists' Hall Association has grown more rapidly during the past year than at any time since incorporation, and it closes the tenth year of its existence with an average gain of insurance upon 1,000,000 square feet of glass annually.

**JOHN G. ESLER,**  
 Secretary.

### Deafness Cannot be Cured

by local applications, as they cannot reach the diseased portion of the ear. There is only one way to cure Deafness, and that is by constitutional remedies. Deafness is caused by an inflamed condition of the mucous lining of the Eustachian Tube. When this tube gets inflamed you have a rumbling sound or imperfect hearing, and when it is entirely closed Deafness is the result, and unless the inflammation can be taken out and this tube restored to its normal condition, hearing will be destroyed forever; nine cases out of ten are caused by catarrh, which is nothing but an inflamed condition of the mucous surfaces.

We will give One Hundred Dollars for any case of Deafness (caused by catarrh) that cannot be cured by Hall's Catarrh Cure. Send for circulars, free.

**F. J. CHENEY & CO., Toledo, O.**

Sold by Druggists, 75c.

WHOLESALE MARKETS.

New York.

Owing to the absence of society people from town and the falling off in the shipping trade with other cities because of being now able to supply themselves, the cut flower trade has reached an unprecedentedly low state, and outdoor grown stock no longer pays to ship to this market, sales failing to cover express charges.

The fruit and vegetable market is overstocked with stock of all kinds, and only with difficulty manages to clear.

Hothouse grapes are greatly in excess of the demand, no matter what price they are offered at even 25c per pound very frequently fails to tempt buyers.

A few forced mushrooms have been seen this week; they sell freely at 75c. per pound, despite the competition of the outdoor crop.

Peaches are very abundant and sell at all manner of prices from 15c. to \$1 per basket. On Saturday very fine quality sold at 35c.

Plums have scarcely got a grip on the market yet, and are selling at very erratic figures; a stated price is difficult to give.

Pears are abundant and cheap, many of the finest samples are being placed in cold storage and are never exposed for sale; \$2.20 per barrel may be regarded as the extreme top notch.

Potatoes have gone up again, and Long Island stock is again making \$2, \$2.12, and \$2.25. Jersey stock is inferior and sells at from \$1.50 to \$1.87, with a few rounds and Rose at \$2.

Apples—Duchess of Oldenburg, hand-picked, d.-h. barrel, \$2@2.50; Gravenstein, hand-picked, per d.-h. barrel, \$1.50 @2.50; Holland Pippin, hand-picked, d.-h. barrel, \$1.50@2; Fall Pippin, hand-picked, per d.-h. barrel, \$1.50@1.75; twenty-ounce, hand-picked, per d.-h. barrel, \$1.75@2; Codling, hand-picked, per d.-h. barrel, \$1.50@2; open heads, red fruit, per barrel, \$1.25@1.75; large green fruit, hand-picked, per barrel, \$1.25@1.50; small and drops, 75c.@\$1.

Peaches—Maryland and Delaware, per carrier, 50c.@\$1.25; extra, per basket, 60@70c.; prime, per basket, 40@50c.; common to fair, per basket, 25@35c.; Pennsylvania, per 20-pound handle basket, 30@60c.; Jersey, extra, selected, per basket, 50@60c.; good to prime lines, per basket, 30@40c.; good to fair, per basket, 20@25c.; culls, per basket, 15@20c.

Pears—Bartlett, large, clean, per barrel, \$2@2.25; poor to fair, per barrel, \$1 @1.75; open heads, common, 75c.@\$1; Clapps', up-river, per barrel, \$1.25@2; up-river, per keg, \$1; Bell, near by, fair to prime, per barrel, \$1.25@1.50; common kinds, per barrel, 50c.@\$1.25.

Grapes—Delaware, up-river, per 24-pound case, \$1@1.25; Niagara, up-river, per 24-pound case, 50c.@\$1; Moore's Early, Maryland and Delaware, 24-pound case, 50@60c.; up-river, 24-pound case, 50@75c.; Worden, up-river, 24-pound case, 50@75c.; Champion, up-river, per 24-pound case, 40@50c.

Plums—Damon, per quart, 2@4c.; green, state, per 8 and 10-pound basket, 15@18c.; table varieties, state, 8 and 10-pound basket, 15@20c.

Watermelons—Prime, large, per 100, \$10@12; small to medium, 100, \$4@8.

Muskmelons—Hackensack, Nutmeg, per barrel, \$1@1.25; Monmouth County, Nutmeg, per barrel, 40@75c.; Jenny Lind, per barrel, 75c.@\$1.50; south Jersey, Gem and Jenny Lind, ordinary, 75c.@\$1.

Honey—State, clover, comb, per pound, 10@18c.; buckwheat, comb, per pound, —; extracted, white clover, per pound, 4 1/2@5c.; extracted, buckwheat, per pound, 3 1/2@4c.

Beets—Local, per 100 bunches, \$1. Celery—Choice large, per dozen, 30@40c.; fair to prime, per dozen, 20@25c.; small and poor, per dozen, 8@15c.

Corn—Hackensack, per 100, \$1@1.50; other Jersey, per 100, \$1@1.25.

Cabbages—Jersey and Long Island, per 100, \$2@3.

Cucumbers—Jersey, per barrel, 50c.@\$1; Jersey, per bushel box, 25@50c.;

Eggs—Refrigerator eggs are not finding favor with dealers just now, consequently there is a brisk demand for fine fresh gathered. Commission men are finding no difficulty in obtaining 15c. to 17c. per dozen for good marks or country eggs.

### Philadelphia.

This market has been fairly well cleaned up on most days of the past week, but prices have ruled low, and much complaining is heard.

Peaches were very poor at the close of business last week, and baskets could be bought as low as 15 and 20c. The only fair fruit received is from Western points; from the Blue Mountain belt of Maryland, of which so much was expected, the fruit is small and inferior, and can be bought in the orchards at 25c. per bushel. On account of cool nights is ripening very slowly.

Tomatoes have improved in quality, but the season is now so far advanced that growers are rushing too much unripe fruit on to the market, and prices keep low in consequence.

Apples—hand-picked, Gravenstein, per barrel, \$2@2.50; Holland Pippin, per barrel, \$2@2.25; Oldenburg, per barrel, \$2.25@2.50; Jersey mixed, per barrel, \$1@1.50.

Pears—Bartlett, Jersey, choice, \$2.25@2.50; fair to good, \$1.75@2; Clapps', per barrel, \$1.40@1.60. Peaches—Missouri, per carrier, \$1.25@1.75; Maryland choice, per carrier, \$1@1.25; fair to good, 50@75c. Upper Jersey, per basket, 50@85c.; fair to good, per basket, 25@40c.; upper Jersey, white fruit, per basket, 60c.@ \$1; fair to good, 35@50c.

Grapes—Niagara, 5-pound baskets, 15@18c.; Concord, 5-pound baskets, 10@12c.

Plums—Red, per quart, 8@4c.; table varieties, 10-pound baskets, 25@40c.

Watermelons—Per 100, \$10@18.

Muskmelons—Jenny Lind, per barrel, 75c.@ \$1.25; mixed, per barrel, 50@75c.; Maryland and Delaware, per one-half barrel basket, 40@75c.; South Jersey, Jenny Lind, per barrel, choice, \$1@1.25.

Celery—Choice, per dozen, 25@40c.; fair to good, 15@20c.

Corn—Jersey, per 100, 75c.@ \$1.  
Cabbages—Jersey, per 100, \$1.75@2.25.

Cucumbers—Jersey, per barrel, 60c.@ \$1; pickling, per 1,000, \$1@1.50.

Egg plants—Jersey, per barrel, 75c.@ \$1; per five-egg this basket, 30@40c.

Lima beans—Per five-eighths basket, 60@75c.

Onions—Jersey, white, per barrel, \$2@2.50; yellow, per barrel, \$1.50@1.75.

Peppers—Per bushel basket, 40@50c.

Tomatoes—Choice, Jersey, 40@50c.; fair to good, 25@30c.

## A. T. De La Mare Ptg. and Pub. Co.

LIMITED.

RHINELANDER BUILDING, (P. O. BOX 1697) NEW YORK.

Telephone, 9154 Cortlandt.

Boston.

Peaches are not coming from everywhere, but all kinds of Peaches are coming here. Stock from New Jersey mostly comes in refrigerator cars, bringing 60c. @ \$1.25 for 16-quart baskets; some Blue Mountain, Pennsylvania and Maryland stock in six basket carriers finds its way here by express and readily brings \$1.75 @ 2 per carrier; some fine Pennsylvania stock in 20-pound baskets catches buyers at 60c @ 90c.

Apples are in large supply, some 20 cars arriving here from Missouri points, and while the best bring \$2, a range of prices follows down as low as \$1 per barrel.

Pears are dull, it takes a fine Bartlett to bring \$2.50 a barrel; Clapps' Favorite might bring 50c., while some of the early odd varieties sell as customers can be found willing to open pocket-book at some figure.

Watermelons easier, larger stock, 14 @ 15c.; while a range of prices extend downward until 6c. is reached; it is a time when loads counting 80 to 90 take the highest prices.

Regarding cantaloupes a wide range appears. Black Japs found ready sale this morning about \$4, with white Japs moving easily around \$2; the beauty of the former is that in cutting, one is sure to find a good eating melon. Montreal melons still moving at a premium among those who have largest amount of money to spend.

Green Corn, large supply, and everybody eating it, therefore fair demand. Very healthy demand for near-by tomatoes.

Limited demand for peppers. Mushrooms still bring \$1 a pound whenever any wanted.

Blueberries reach this city from New Brunswick, and bring 5 @ 8c., according to their blueness.

Celery holds steady; so much fruit around demand is not large; choice marrow squash in good demand about \$1.50 per barrel; near-by growth showing up fine.

Peas about out of the market. Potatoes are very firm; nearly all receipts showing much decay; the growers praying for cold weather, hoping it may stop the rot; \$2.50 @ 2.75 is the lowest good stock can be purchased.

Sweet Potatoes are off a little; selling \$1.62 @ 1.75.

Cucumbers about 1/4c. apiece; cabbage 3 @ 5c. a head; with very little demand for Cauliflower.

Onions have lost another peg, and \$1.75 highest price for best stock to-day, while some Ohio barrels can only be sold at \$1.50.

Carrots steady at 2 @ 2 1/4c. a bunch. Pineapples hardly wanted with so much other fruit.

Mint 45c. a dozen bunches; parsley 75c. a bushel.

Plums are here in immense quantities; there are so many people still in the country, that preserves are hardly in order, therefore 20 @ 25c. per 10-pound basket seems to be the moving price; California crop is little more than we should have if we want to get big prices for that grown in New York state.

Some Worden grapes have appeared from Hudson River, likewise a few Delawares; but there is hardly color enough on the latter to give satisfaction; in 5-pound baskets Delawares brought 18c., and Wordens brought 15c.

The work of the National Farm School at Doylestown, Pa., is progressing very satisfactorily. The faculty of the school is gradually being enlarged. S. S. Darlington has been chosen instructor of pomology, B. T. Adler, instructor of the breeding of live stock, and Joseph S. Andre, instructor of floriculture. The first two instructors are specialists in their respective lines at the Burpee Seed Farm, opposite the school.—Ledger of Philadelphia, Friday August 27.

The Los Angeles Co. (Cal.) Horticultural Commission acting in conjunction with the Agricultural Experiment Station has been trying for some time past to devise an apparatus which would permit the use of insecticide solutions at different degrees of heat for spraying trees. Charles B. Boothe, of the firm of that name in Los Angeles, claims to have devised such an apparatus, one which, it is said, answers all requirements, enabling the spray to be applied at any degree of heat. The trouble, hitherto, has always been to keep the wash hot and to so regulate the temperature of it as to prevent injury to the tender growth, but still with sufficient heat to be effective in the destruction of scale. The apparatus is automatic in its operation and two, four, or more spraying nozzles can be used at the same time.

Probably there is no better fertilizer for fruit trees than a mixture of muriate of potash and ground bone (one part of the former to one and a half parts of the latter.) A good practice is to apply this mixture to clover or some other leguminous crop which is turned under as a green manure, and, in addition, where tobacco stems can be obtained cheaply, to apply these about the trees. Wood ashes or cotton-hull ashes may be substituted for muriate of potash if these products can be obtained at reasonable prices.

In deciding upon the kind of manure to use the character of the soil must, of course, be taken into account. Crops grown on soils poor in decaying vegetable matter (humus) are, as a rule, benefited by applications of nitrogenous manures, while those grown upon soils well supplied with this substance are more benefited by phosphates and potash. Upon heavy soil phosphates are likely to be more beneficial than nitrogen, while the reverse is the case on light, dry soil. All sandy soils are, as a rule, deficient in potash, while clayey soils contain this element in larger quantities.

# The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.  
On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

## ALL ABOUT THE HOME PLOT

## POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Favorite Roses.

The question of plant growth aside, the favorite Roses are those most exquisitely moulded and textured, and in one's favorite color. In market cut flowers, where the question is one of becomingness for personal adornment, largely, Bridesmaid, Augusta Victoria, Meteor, and Perle des Jardins, have been prime favorites. For bold interior decoration, American Beauty has scarcely seemed to have a rival. General growers of Tea Roses outside, have placed their affections on oddly-colored Roses, like Madam Margottin (with its citron yellow outside petals, and beautiful pink center), Mdme. de Watteville, Lucile, Charles Rovelli, etc.; while the favorites in the more finely formed Roses have been Etoile de Lyon, Marie Guillot, Princess Vera, Perle, Cochet, Bravy, and many others. When the question of plant growth comes in, partially as to other qualities must often be set aside, though nearly every Rose named above is good.

## The Neglected Rose.

An old, but little known Rose, known as Madam Marie Blanchi might, if more grown, help out the cause of Roses generally. It is dwarf, never making a large bush, but the blooms are large, pale, silvery lilac-rose in color, and produced with more constancy than is shown by almost any other Rose in the long list of hundreds. So good a Rose must have been neglected because of its delicate color—not a very popular one, or else because it has not been pushed.

## Average Prices for Poultry Products.

The Maine Farmer affirms that the two articles of daily consumption which have stood the test for years, and maintained the most uniform prices are butter and eggs. This one simple fact ought, alone, to give sufficient quietus to the fears of those who think the poultry business overdone, or liable soon to become so. Poultry carcasses do not appear in this mention, to be sure, but reason for this may be found in the fact that they are not fairly considered as being articles of daily consumption. Any one at all familiar with prices for the past fifteen years, can confirm the affirmation that poultry products have maintained a decent average, generally without the "slumps" so common in many other classes of farm products.

## One Dozen Eggs.

Eggs are cheap, they say, so cheap many think that it doesn't pay to bother with them; and six cents a dozen is cheap. Too cheap, all but the consumers will admit. But in many parts of the country such low prices are unknown. Wherever a dozen of eggs is equal in average yearly price to a bushel of potatoes, to a half-barrel of apples, to two pounds of butter, to two baskets of berries, the price for eggs is better, proportionately, than for most other products of the farm; and it is well worth while to inquire whether this dozen eggs cannot be produced more easily than any of the other items mentioned.

## The Farleyense Fern.

Some window gardeners measure the height of their ambition by their ability to successfully grow the florists' Maidenhair. Few of the average growers know that there is more than one variety of Maidenhair Fern, and few can keep one in decently fair condition a month after receiving it from the florist. Perhaps the greatest success of some may be due to the fact that they have one of the less tender sorts. Farleyense, however, so often chosen for its great beauty, is not one of the easiest to grow. It requires strong and even heat, as well as moisture in the atmosphere. No living room can furnish this atmosphere to the Fern. The necessary moisture for the foliage may be in part secured by using a very fine atomizer frequently upon the foliage. Yet water must not be applied so heavily

that the fronds will remain wet over night. Good, fresh, turfy loam is the best potting material for a Farleyense. It may be made moderately rich. Cuneatum is considered by many an easier Maidenhair to grow. However, probably the greatest help to Fern growing for the window gardener would be to procure plants grown as cool as possible. This applies, also, to Palms. These cool-grown plants may possibly not be of such luxuriant beauty as others, but they will feel the change less, and will thus be far more satisfactory.

## Combining Manettia Bi-color.

We find this peculiar looking plant strongly advised for combination with Roses. It seems that there should be much distinction made here. With pale creamy yellow and whites, it might be very pretty indeed, but the artistically inclined should beware of placing it beside the purple-reds and rose-pink sorts of Roses.

## Rabbits and Poultry.

In Australia, where rabbits are almost too plentiful, poultry keepers are utilizing rabbit flesh as meat for the poultry. As poultry keeping, and rabbit keeping so often go together here, it is a question whether our Australian friends' practice may not hold a hint for us. There may be those having more rabbits than they can dispose of freely, who might work them off to profit in this way. Hens will stand a considerable amount of meat, provided they have bulky food enough to offset it.

## Enough Room.

Room enough to be happy, room enough to be healthy, room enough to be prolific; this, and only this, is enough room for poultry, anywhere. There is some difference of opinion as to how much room it takes for this. It might almost be said that hens in confinement are never happy. Yet, after they have been confined long enough to have forgotten their freedom, with the one proviso that they be kept busy, in wholesome quarters, they may be made to seem happy enough to pass very well for actuality. There is really not a more paying way to get room than to cull, and cull, and cull yet again. Not merely to feather, as does the fancier, but to thrift and prolificacy. It is ever the weak that bring down the average productiveness of the flock, and therefore the average profit.

## Gynura Aurantiaca.

Day by day this handsome novelty grows in the estimation of the window gardener. It is not merely its unique beauty that calls forth praise, for this would count for little without the good constitution which enables it to hold its beautiful foliage, and to withstand alike the untoward drought of summer and the excessive soaking of a protracted rainy period. Unlike most leaves having a heavy pile, like velvet, these have shown no sign of suffering from daily sprinklings, when given plenty of fresh air. And, although the coloring seems but a mere touch at the end of the plush-like hairs, it is strong and unfading, and does not fall, even in shade.

## A Specimen Hoya.

In the window of a woman who disclaims any special knowledge of the needs of various plants, was lately seen a Hoya carnea which disputes nearly every theory as to the needs of this favorite plant. It covered the entire archway of a large bay window, a solid mass of overlapping greenery. In summer it enjoys a monopoly of window privileges; in winter it takes just what it can get after all the other plants have received place and light. With this scant care, it flourishes and blooms regularly, if not profusely. It is never close to the light, is never removed from its position, and is seldom even sponged. Yet it, apparently, has never lost a leaf. Many an "expert" plant raiser might envy its owner's success with a subject sometimes found difficult. A large receptacle and a large amount of letting alone seem to be the specifics in this case.

## Studying Descriptions.

It is quite the fashion in certain

quarters to decry the descriptions of the catalogues, and to hint that interest in sales influences descriptions. Critics fail to note that plants are, as a rule, accurately described except as to omissions. Manifestly, not everything about any offering can be told in the few lines usually allowed, and if the poor human nature of the average dealer allows it to happen that the omissions are such as relate to defects, this is only what we should expect and allow for in our receipt of the intended impression. And, in spite of human nature, it generally falls out that a faithful study of the catalogues of a number of firms will give a pretty accurate idea of any particular specimen. If one firm tells us only of the exquisite coloring and matchless profusion of Duchesse de Brabant, for instance, another will chance to admit that it is not quite full, and a third that it lacks the highest perfection of form. Those florally inclined cannot live on catalogues, especially in these days of delightful horticultural publications, but they make these dealers' tools systematically useful, and that entirely outside the line of the colored plates.

## READ THIS FIRST

The publication of the below article in a recent issue of **AMERICAN GARDENING**, has brought Mr. Jerolaman hundreds of letters from every part of the country.

### Strawberries Henry and Mary.

We have grown almost all varieties of berries, but have only found two really large fruited ones. The one is Mary, originated by the late H. Alley of this village, the other is called, here on Boyden Farm, Henry. We grow tens of thousands of quarts from each variety every year, and they are without doubt the largest and best of all grown in the whole world. I have had this season thousands of quarts of Mary, where from five to ten berries would make a heaping wooden quart, and I have preserved several in glass jars, with formalin, so that all who doubt can come here and see for themselves. Some of these berries in the jars measure thirteen inches around. I am the present owner of the Seth Boyden farm. Seth Boyden originated the first large strawberries, perhaps, in the world (Agriculturist and others); he died in 1870. I then bought his farm, and have continued to grow strawberries from that time to this, and will say that I am positive the plant called Henry is, beyond all doubt, not only the strongest plant, but the largest, best, hardiest, and sweetest strawberry ever yet produced; color dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. I have grown it for the past four years for market in a small way, and this season nearly one-half of all that I grew was Henry; it will out-produce any strawberry plant that I have ever known, four-year-old plants giving very large, and just as fine berries as plants one year old. The plants as yet have shown no disease, while all other varieties, such as Great American, Jersey Queen, and nearly all varieties except those soft berries not good for market (Sharpless, Bubach, and others), have shown disease in the plant. The Mary this season could not stand the hot sun, and nearly one-half of all the plants burnt and dried up while full of berries. Mary will not bear the second season, but must be set every year, while of Henry, not a single plant has died, either old or young; it is the first berry ripe and the last. I am picking large berries from the Henry to-day, July 15.—HENRY JEROLAMAN, N. J.

Mr. Jerolaman will not answer any further correspondence except through the columns of **AMERICAN GARDENING**.

## YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

**T**HROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of **AMERICAN GARDENING** have become possessed of the story of the life and cultural methods of **Henry Jerolaman**, undoubtedly the **STRAWBERRY KING OF THE UNITED STATES**. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of **AMERICAN GARDENING**. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us **One hundred thousand plants of the HENRY STRAWBERRY**, which we will distribute as premiums to subscribers to **AMERICAN GARDENING**. The Henry Strawberry has positively never been advertised until now.

### THE CONTRACT

*Publishers American Gardening.*

*Gentlemen,*

*I hereby agree to furnish you within the next twelve months in quantities as ordered, One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold.*

*Witness*  
*Thos. D. Colburn.*

*(Signed)*  
*Henry Jerolaman*

### The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of **AMERICAN GARDENING** has brought him hundreds of inquiries from the cream of the professional growers.

### A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one strawberry grower in every town, village, and hamlet can come into a good thing through practicing the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

### TAKING ADVANTAGE OF OUR OFFER:

For \$1.00 (check or money-order preferred) we will at once forward you, by mail, postpaid,

**FIVE PLANTS** ..Of the.. **HENRY STRAWBERRY**  
Unequaled  
**And AMERICAN GARDENING One Year.**

Plants to be shipped this Fall or in the Spring, as you prefer.

Mr. Jerolaman's story will be found in the first issues mailed you and his cultural methods will be published in time to be of service for Fall planting.

### TIME IS SHORT—ORDER AT ONCE.

### Offer Extraordinary

As a premium we will mail, post-paid, Five plants of the **HENRY STRAWBERRY** to any subscriber sending us a new subscription at \$1.00. Five Henry plants will also be sent to the new subscriber. This is a **BIG OFFER** to all who want to become larger holders of this wonderful Berry, never before advertised.

Present subscribers are entitled to this Offer on renewal, if their subscription has not expired, it will be dated ahead.

# THE HENRY

## The Most Wonderful Strawberry of the Age.

**M**ESSRS. STEVENS, SIMPSON & CO., Commission Merchants, 232 West Street, New York City, state they handle the HENRY Strawberry, and have realized for it the highest price obtainable for any outdoor stock coming into New York market. Mr. Simpson further states that, in his opinion, as grown, packed and shipped by Mr. Henry Jerolaman, it is the BEST HOME MARKET BERRY in existence. For SIZE, COLOR, and SWEETNESS, and, in its KEEPING QUALITIES, IT HAS NO EQUAL; these many points in its favor rendering it easy for the grower to realize considerably more per quart than the regular market value of Strawberries generally.

**M**R. JEROLAMAN says, and his statement is corroborated by those who have seen the fruit: The HENRY is beyond all doubt not only the strongest plant, but the largest, best, hardiest and sweetest Strawberry ever yet produced; color, dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. . . . It will out-produce any Strawberry plants that I have ever known, four-year old plants giving very large and just as fine berries as plants one year old. . . . The plants as yet have shown no disease. . . . It is the first berry ripe and the last.

Read about it on Preceding Page.

## Planting for Timber.

Please give me name of book that gives most reliable and fullest information on cultivating the black walnut for profit. Somewhere I have seen much of the information I wish, but have forgotten exact name of book containing it and by whom. As well as I remember it was something like "How to Grow Rich in the South," and published by some man in Cincinnati or Chicago.

I have "Nuts for Profit," by Parry, but it gives little of what I wish to know. Best information may be found in some work on timber, as it is from the timber rather than nuts, I expect the returns. I want to know: kind of soil, how best to plant nuts in field, or first in nursery to transplant, how to select best nuts for planting, how to cultivate and how long, if land that overflows can be used to advantage, and how long small trees could be covered with river water and live; how old or what size trees should be for first cutting or thinning of grove, how close planted, and how close left after each cutting.

As nearly as can be made, an estimate on the output, itemized, say for 200 acres, as to fencing, labor, care-taking, etc., as well as land and transportation. Then as to income, as to when first returns may be reasonably expected, amount of same of each succeeding cutting, as to time and amount. When remaining trees will reach what may be considered maturity.

Of course it will be many, many years hence, if the river bottoms of the south that crops can't be grown and harvested on, could be utilized in growing timber (where first growth of timber has been cut) for coming generations, but those now planting will accomplish something, though personally reaping no benefits.

Some book you publish may answer these and many other important questions on the subject.

Of course any estimate would be subject to change in each detail, but some one has figured on it and given rough estimates worthy to be considered.—L. B., Ga.

The planting of trees is always to be commended whether the object be profit or pleasure, but perhaps more especially so when, as our correspondent says, no personal benefit is expected therefrom. I am inclined to believe, however, that every planter of trees does derive much solid satisfaction from the mere fact that he is leaving behind works, not words—a living, growing monument.

We hear so often such selfish expressions as, "What's the use? I'd get nothing out of it;" or, "It would be of no use in my time," and in reply to them I repeat the words of an active gentleman, sixty years of age, who is gradually working his immense business into younger hands: "Now we have got this large country place for the boys and girls, plenty of room for houses and crops, with abundant woods and water, and yet I believe it will pay to cover some of our poorest land with timber trees." The words have been put into practical operation and to-day—seven years after—there are under way 15 acres of Pines, 20 of European Larch, 8 of American White Ash (*Fraxinus Americana*), 20 of English Walnut, and 30 of Black Walnut, and by the appearance of stock in the home nursery, the end is not yet.

This was done on Long Island and what can be done there can no doubt be much better done by our correspondent in more genial climate and soil. Perhaps a few details of the work connected with the Black Walnuts may give more satisfaction and points for guidance than any figures however well computed.

The nuts were gathered from a grove on the place, and sown in the fall in shallow trenches 12 inches wide, and 3 inches deep. The plants began to appear the following May and continued growing until August, making a growth of from 8 to 12 inches. These were dug the following year and when necessary a part of the tap root was cut off, a noticeable point being that there were very few to cut, which was attributed to the very stony piece of land on which the nuts

were sown. The seedlings were transplanted to rows 4x2 feet, and planted permanently two years later (1892). The site was on a hillside and bottom lands; the soil, gravelly loam, the bottom portion with slight hummocks here and there and underlaid with blue clay.

The planting on the hill side was fairly good. In the bottom, except on the hummocks, it was not good as water would be at the surface for seven to ten days at a time in winter, causing a number of blanks.

Holes were dug in the sod for all this planting, and the labor afterwards consisted in mowing the land over twice a year and using the mowings as a mulch about the trees.

This I considered the least satisfactory of the Black Walnut planting, partly because the trees were too large at the time of planting, and partly because the natural springs in the bottom portion caused the young roots to rot.

Our most satisfactory plot is on the lower part of a sand and gravel ridge where the depth of top soil is about 6 inches. These, planted in the spring of '96, were sown in '94, and taken direct from the seed rows, and had plenty of fibrous roots. The land was plowed and harrowed, trenches six feet apart were opened with the plow, and the trees planted six feet apart in the lines so that a one-horse cultivator can be run in all directions and stir almost the entire surface, the balance being done by hand. Thus the land is kept free from weeds; no fertilizer was used nor any crop grown—except weeds—for a number of years.

At this writing the plants average four feet in height and one inch in diameter at the base. The oldest young trees are 20 feet high, and measure three inches in diameter at three feet from the ground.

The selection of nuts for seed is only a secondary consideration as very few trees would produce nuts like the parent. Sow in trenches in the fall and transplant to permanent place from the seed bed; plant 6x6 and cultivate as for corn as long as the horse can push through without damage to the trees.

Our correspondent will please note that land suitable for farm crop has not been used for any of the afore-mentioned trees excepting the English Walnuts.

I think that figures would be of little use to L. B., as so much depends on location, labor, and market, but I would strongly advise the planting of all lands not first-class for farm purposes, and it is very poor land indeed that cannot be utilized and improved in every way by some kind of wood. If marshy, sow White Cedar; if sandy, put to Pines. Land almost destitute of "soil" will support White Birch, Black Birch, and Red Cedar. Among higher lands some of the Oaks and Larches will be at home. In fact, some woody growth can be found to cover almost all the extensive waste portion of this vast country.

The varied purposes to which wood is put and the call for it will depend on the locality of the planter, who will be the best judge of what he should plant after careful inquiry in the nearest market or city.

JAMES HOLLOWAY.

## Bagging Grapes.

I have tied a paper bag on a cluster of grapes to see if they will ripen sooner, as I saw in your paper some time ago. Please state if you think they will, and oblige an old subscriber.—J. M., Mass.

—The paper bag possibly will not cause the fruit to ripen more by quick, but certainly will make cleaner and better fruit, and preserve the bloom on the berry, thus getting a better appearance.

## Pear Trees Suckering.

Why do suckers grow so freely from the base of pear trees? I cut them away each spring, yet they repeat themselves before the season is over.—J. M., Mass.

—Probably the fault is with the grafting and the suckers are coming from the pear stock. This fall clear away the earth from the bole and cut the offsets away clean.

## Chrysanthemums.

Cool nights are with us and a little attention to ventilation is now in order. Our ventilators are never closed through June, July, and August, save during a gale, for plants fairly revel in the cool night air after a hot, exhausting day; it hardens the wood and builds up the plant, but when September is ushered in, and the temperature outside drops to 48 degrees and thereabouts, the side ventilation should be reduced, or the quick transition from a hot day to a cool night may cause a check to the buds. Plants should not be "coddled" by any means, but the change in temperature is very great and should be guarded against a little.

Plants outside will very soon need housing, for any time after the middle of the month, we look for a touch of frost in Jersey.

If it is desired to retard some plants for late work the terminal bud should be taken and the plants put in a house by themselves. The ventilators should be closed only in case of actual frost. Late varieties only should be used for this work as early kinds would only open in midseason, and the flowers would not be nearly so good as they would if let flower when nature intended they should.

Feeding with manure water is probably the biggest job now, and it must be persevered with. Changing the barrels from week to week, from one kind of manure to another, is better than mixing it together, change of diet being very beneficial. It is pretty hard work and not the most agreeable in the world, but on it depends a large measure of success, and the only way to do is to put on your boots and sail right in, never looking "where the chips fall." It is just about now that we realize that the "mum" is a gross feeder.

C. TORRIS, N. J.

## Moving Trees and Shrubs.

Can I safely move pines, hemlock, spruce, etc., and what evergreens in the fall? What is the best time to move deciduous trees, shrubs, etc., and ordinary herbaceous plants? Also, I have about two acres of very sandy loam, which is only six inches deep, under which is yellow sand six feet deep. I wish to make a first-class vegetable and flower garden of same. What had I best put on it to do so? I have my own ideas, but wish to hear yours.—W. L. P., Mass.

—Fall planting whenever practicable is certainly the best for nearly all classes of trees and shrubs, also herbaceous plants. Such planting may be safely begun now very shortly, unless the trees are of such size that in order to retain the ball of earth at the roots they need to be frozen. When such is the case, a trench needs to be cut around ahead of severe frost in order to bring about the desired result. In regard to the soil preparation inquired about, it would certainly seem necessary to bring some of the sand to the surface in order to give a greater depth of soil than six inches. To thoroughly enrich this, it will be best to trench and at the same time turn in quantities of barnyard manure now during the fall, and in the spring give a surface dressing of well-rotted stable manure. With such treatment good results may be expected.

## How to Get Rid of Nut Grass.

I would like to inquire if you have ever heard of nut grass, and if you have, how to kill it. It is a very troublesome grass and spreads. There may be another name for it which I do not know. It grows from a nut in thick patches.—W. H. SOCLA.

—*Cyperus rotundus*, or nut grass, is a very difficult weed to exterminate. In the South one of the methods adopted is to fence off squares and turn hogs in who root it up. Another method adopted and which, in your case, may have to be resorted to, is to smother it out with some other strong quick-growing crop.

## Pot Culture of Orchard Fruits.

### Grown Under Glass.

Orchard-house fruit growing is, comparatively speaking, an unknown and unpractised art in the United States, and it will therefore be of the greater interest to our readers to learn about the success achieved in this line at Rockwood, the country seat of W. Rockefeller. This estate stands out prominently in many horticultural respects, owing to the excellent condition in which the 646 acres are kept, and by the lavish expenditure upon the landscape gardening operations.

The 20 well-appointed greenhouses are also no mean feature. But at this time there is only one portion of them, that devoted to fruits that interests us. It is questionable whether indoor fruit growing in this country has ever been brought to such a degree of perfection as has been the case at this establishment during the present season, and it is to the capable gardener, Mr. William Turner, that the credit of this high state of excellence is due, he having personally attended to this portion of his varied charge. At the same time his success is in relation to the interest of his employer who has stinted nothing that would tend to bring about the desired results.

The orchard house proper is 80 feet long by 30 feet in width, with a curvilinear roof, three-quarters covered, resting on a high back wall; the aspect of the house is east and west. Against the back wall on the west side stand a number of peach and nectarine trees in 24-inch tubs; these are covered with fruit, and consist of Pitmaston Orange nectarine, Crawford's Early, Crawford's Late, Oldmixon, and Foster's Seedling peaches. Two peach trees of the variety Crispin Gland in 10-inch pots are bearing profusely; this is a peach of a very high color and medium size.

Rivers' Early peach was gathered some time ago, and the fruits are said to have been very fine. The other peaches mentioned are yielding now, and will give a

Watering is an important feature, and careful attention is given to it, overhead syringing is also done twice each day.

All the pear trees are double grafted and worked on the quince stock, while the plums are single grafted with the union showing from 8 to 10 inches above the pot. Very few roots work through the pots and wood is made sparingly.

The plum trees are about four feet six inches high, and the pears about five feet six inches. Nearly all the trees have been imported from the well-known English firm T. Rivers & Son, Sawbridgeworth, England.

Only two American varieties are grown; these are Lincoln and Spaulding plums, and neither the trees nor crops can compare with those already mentioned, enormous crops are the rule otherwise.

Among those bearing largely of large high-grade fruit are the following: Monarch, The Czar, a large black plum of fine flavor; English Green Gage (full flavor), Transparent Gage (see fig. 179.), very large and carrying more than 100 fruits; Mallard, a heavy cropper; Belgian Purple, enormous crop and a grand plum; Jefferson, fruit very large; Coe's Golden Drop, very prolific. Kirke's Seedling is not a success, and will be discarded after this season; it fruits freely but lacks quality.

Among pears the most conspicuous are Souvenir de Congress, on one tree of which are thirteen fruits, and while not yet ripe, would easily weigh one pound each, and already girth over 12 inches; another tree of this variety bears eight fruits of even greater size. Conference is bearing from twenty-five to thirty fruits each. Louise Bonne de Jersey is bearing thirty even-sized, high-colored fruits of very handsome appearance as our fig. 180 shows. Doyenne du Comice does not appear to bear so well as the other kinds. Pitmaston Duchess makes a great display, its large even clear-skinned fruits are remarkably striking. The fruits not yet matured, measure five inches in length and have a girth of 11 inches, and will probably average in weight about 14 ounces each. No fire heat is ever used in this house.

## The Vegetable Garden.

**Siberian Kale.**—This is a very useful vegetable for early greens, being very hardy. A supply of this can easily be had for early spring, by sowing in rows 18 inches apart, now.

**Cauliflower and Cabbage** should now be sown to be transplanted later into cold frames and protected over winter. They must be freely ventilated at every opportunity.

**Corn.**—Any ears of corn that may not have been utilized when frost comes, can easily be kept two weeks or more after then, by cutting the stalks and putting them in shocks not large enough to become heated in a sheltered position. It is a good plan to have a few rows of good late corn for this purpose, the ears of which should not be picked. The corn if left on the stalks in this manner will keep fresh a long time in the cool month of October.

**Tomatoes.**—Wherever there are plenty of tomatoes, as many plants as possible should be left without gathering the fruit. Before frost pull up the vines, roots and all, and hang up in a dry, warm shed or greenhouse, and every tomato will ripen, and be nearly as good as if ripened on the vines outside. All scattering green tomatoes can be gathered up, put on shelves and will also gradually ripen. In this way tomatoes can be had quite late in the season.

Intending Exhibitors at the many county fairs will now be getting ready for exhibiting. To progressive gardeners, many county fairs do not offer much inducement as the schedules for vegetables are frequently out of date. In order to give a fair chance and to encourage the growth of well-selected and a good variety of vegetables, premiums should not be offered for the largest collection of vegetables, but for the best. In the first premium collection of vegetables in Rhode Island last year, I noted 33 varieties of shelled beans, 6 varieties of old

peas shelled and corked up in glass bottles, together with a mixed collection of seeds of self-saved onion, oat, rye, buckwheat, also in glass bottles, which could not be classed as vegetables, but all counted and made up the largest collection. Any rational judge would disqualify such a collection as this. It is not the quantity of anything that should be

FIG. 180.—PEAR LOUISE BONNE DE JERSEY GROWN IN A POT.

grown that is to be encouraged, but quality, and judgment in the proper selection of varieties, these well grown and tastefully arranged on the tables, having all the specimens as near of equal size as possible, celery to be nicely blanched, and roots and useless leaves trimmed; they everything should be fit for culinary use as we like for show. Vegetables grown especially for show purposes are often useless freaks. It is better to show a large fine-shaped egg plant, than a big squash. Award premiums to skill, and encouragement is given to excel in quality and not in quantity.

W. M. EDWARDS, Conn.

### No Money in Sunflowers.

Can you give me any idea if Sunflowers can be successfully raised in this part of the country, and whether a living could be made out of them. Is there any more money in it than there is in corn?—W. F. SCHMEISKE, Pa.

—It would be impossible in your location to raise Sunflowers as a crop and make a profit. The industry is already at a low ebb as regards value. St. Louis, Cincinnati, and Chicago are the centers where the seed changes hands in bulk and there the selling price to jobbers and dealers in bulk, does not exceed one cent and a half per pound, sometimes falling lower than \$30 per ton.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send 2c. stamp for our new catalogue.

FIG. 179.—EARLY TRANSPARENT GAGE FRUITING IN A POT.

succession of fruit till the end of this month.

Pears and plums are pyramid trained and are in 10 and 12-inch pots, each pot being sunk up to the rim in humous soil, which prevents drying out and maintains a moist cool temperature near the roots.

## Twenty Fifth Session of the American Pomological Society.

[Special report for AMERICAN GARDENING]

The 25th biennial session of the American Pomological Society was held at Columbus, O., September 1 to 3, by invitation of the Ohio State Horticultural Society.

Wednesday morning was devoted to preliminary matters, such as the enrollment of new members and the appointment of committees. In the afternoon the Society was taken about the city upon the electric cars, stopping at the State Fair, where particular attention was paid to exhibits in the Agricultural Hall. The walls and side tables were occupied by tastefully arranged displays of vegetables and grains. Next on either side was a wide table filled with plates of fruit; apples of, course were in largest numbers, and while the crop throughout the state is nearly a failure, many of the specimens were very fine, especially where they had been sprayed. The benefit of spraying was well illustrated by a number of trays of sprayed and unsprayed apples in the exhibit of the Ohio Experiment Station. Not only was the effect shown in the increased size, but the fruit from the unsprayed trees was so scabby and wormy that few were marketable, while the trees sprayed with Bordeaux mixture gave fruit that was free from culls.

The exhibit of pears, grapes, and plums was also very creditable, but the peaches did not number over a half-dozen plates.

On Wednesday evening there was a joint session with the State Horticultural Society. An address of welcome on behalf of the city was made by Mayor Black, while N. H. Albaugh gave the welcoming address for the state society. He "pointed with pride" to the progress made in pomology in Ohio. As in addition to large orchards of apples, pears, and plums, there is a large area along Lake Erie entirely given up to grapes, while peaches are largely grown in the northwest portion of the state and along the Ohio River. The Ohio State Horticultural Society is even older than the American Pomological Society, having some years since celebrated its semi-centennial, and it has a number of old and thriving county societies; among them is that of Montgomery county, which for thirty-one years has not missed a monthly meeting. He also commented on the benefits to pomology of the work of Elliott, Warder, Kirtland, and Weltz. In the way of varieties of fruits Ohio has furnished the Stark and Rome Beauty apples, the Gov. Wood and other cherries originated by Dr. Kirtland, and the Diamond peach, besides numerous other sorts.

In his response President Berckmans commented on the excellence of the fruit exhibit at the State Fair, which showed that Ohio is not surpassed in growing the fruits adapted to its soil and climate. In addition to the names mentioned above he commented on the benefit that had been done by Johnny Appleseed who in his peregrinations about the state, had scattered seeds from which many trees of much value had come.

In his biennial address, President Berckmans referred to the great increase in the number of plant diseases and insects, and the benefits that had come from the work of the experiment stations in furnishing methods of combating them. They have also been of much value in testing the new varieties of fruits that are introduced and in learning their adaptation to the different parts of the country.

Among the members who have passed from earth since the session of 1895 are Dr. C. V. Riley, A. S. Fuller, H. M. Engle, W. W. Adams, Franklin Davis, John Saul, Robert Douglass, David Allan, John S. Harris, and David Scott.

In the discussion on new varieties of fruit, George W. Campbell of Delaware, Ohio, gave the history and a description of Campbell Early grape, specimens of which were on exhibition. It was originated in 1885, and was either one-eighth or one-fourth Muscat Hamburgh, and was the only one that he thought worthy

of introduction of thousands of seedlings that he had grown during the thirty or forty years that he had spent in endeavoring, by crossing and hybridizing, to improve our American grape. He had determined not to introduce them unless they were in some important respect better than the varieties we already had.

The season and hardness of Campbell's Early admits of its being grown wherever the Concord succeeds, as it is nearly two weeks earlier, and in vigor, foliage, and hardness is equal to that variety. It has a more tenacious skin and handles without breaking, and is never known to crack. They will also hold on the vines for six weeks without breaking down. This shows that it is unsurpassed in its shipping and keeping qualities, and it never shells. The skin is thin but firm, and there is no acid taste beneath it. The seeds are small, few in number, and are free from the pulp. The fruit stems are very stout, the bunches are large, close, and generally shouldered; the berries are about the size and color of Moore's Early, but are of a higher flavor. In making his crosses he used the hardier sort as the female and found that the character of the new sort was a union of those of the parents.

Brilliant grape was reported by Mr. Woodard of Ohio as far from promising, the plants being unhealthy and the fruit setting poorly.

Diamond peach was described by N. H. Albaugh as a large, handsome yellow cling of fine quality.

Prof. W. J. Green of the Ohio Experiment Station at Wooster, spoke upon new and promising small fruits. Although not as early as claimed, King has proved the best early red raspberry; it is large, bright red, quite firm, and of good quality. In growth and productiveness it is preferable to Loudon. While the latter hangs on a little too firm, the King drops too readily. Miller is good, but not up to expectation, as it is too weak in plant and not productive enough. Lotta is black, three or four days earlier than Gregg, and as large as that variety. Kansas seems better each year. It is a strong grower and productive, and the berries are large, firm, and of good color. It is of rather short season, but that is not always a fault. Eureka has been disappointing as it is so severely injured by anthracnose as to lessen its vitality; it is earlier, but the plants are less strong, and the fruit less firm than Kansas.

Of strawberries there are few of the newer kinds that are worth mentioning. Clyde takes front rank on account of its extreme vigor and productiveness; the flowers are perfect, but the fruit is rather soft and light in color. Glen Mary is inclined to be rough, but is quite promising. Staples does well as a fertilizer of Warfield, as it is perfect flowered and of the same color, although a little earlier. Ruby is a perfect flowered sort that is medium in season, as it begins early and hangs on late; color scarlet. Carrie seems to be an improvement on Haviland. Although Brunette often fails it excels all other varieties in quality. Brandywine comes on late, and the last pickings are best, and although it is not very productive, its large size and good quality make it a desirable sort. William Belt has the one fault of rusting badly.

Prof. H. E. Van Deman of Virginia confirmed Prof. Green's opinion of the King raspberry, as it is of a beautiful color, and as he had seen it at its home in Virginia it was better than the best of the standard sorts. Miller as grown on the Chesapeake peninsula is more productive and a better variety than Loudon.

Prof. Alwood, of the Virginia Experiment Station, spoke of Tennessee strawberry as one of the most valuable market sorts for the South. Rathburn blackberry was a failure at first, but for the last three years has excelled all other sorts in the size and quality of its fruit. While it is said to root from the tips, it seldom does so.

(To be continued.)

Every good gardener wants the best books. Our new catalogue of selected books is the best guide out. Sent for 2c. stamp.

## The Fruit Garden.

**Currants and Gooseberries.**—If there are any blanks among the bushes, the present is a good time to replant, and the bushes will practically be established before winter, if heavily mulched at the first appearance of frost. Cuttings made now and thickly dibbled into deep boxes (plunged in the ground, lifted and brought into a cool cellar before the ground freezes hard) will make very lively cuttings to plant in the spring.

**What of the Fruit Rooms?** "Are all repairs made, the walls and all corners clean, and ready for use?"

**Selling.**—If you have fruit to sell, put it in clean receptacles, which bear your name. A good name is a good selling card, do not forget that a good market can often be found or made nearer home.

**Season.**—Yes, I confess it is rather a disappointment to buy a winter apple and find that it has to be used in September. Salome is catalogued as in use from December to May, but it does not pan out that way around New York, not but that the fruit is good and handsome, only it was not bought for that season.

**Apples and Pears** are dropping very badly this year, caused probably by the unusual season—very dry in June followed by a long spell of cold rainy weather—leaving the foliage in bad condition with fungi, followed naturally by a weakening of the whole tree.

**Peaches and Grapes** are nearly two weeks later than last season.

**Budding.**—The season will soon close and any peach budding had better be done at once if the wood is in the right condition.

**Thinning.**—This is also the time when we regret that the thinning of fruit was not more severely done, and we now it shall not happen next year. Write it down!

**A Grand Tart Apple** for cooking now is the Holland Pippin. Fruit very large, a little flattened, stalk one-half inch long; skin, a pale green, with a few large darker dots, pale yellow when ripe, with a little dull red on one side. Fall Pippin is sometimes catalogued as the same, but the stem and calyx are very distinct.

**Peach Red Rareripe** is not at first a very taking variety, but it is one that is more appreciated by use.

J. HOLLOWAY, L. I.

## Aquarium Matters.

(1.) Can an aquarium of about eight gallons capacity be successfully conducted during the winter months in a conservatory, temperature 40 degrees to 60 degrees, without a constant supply of running water?

(2.) If so, what plants should be introduced, where can they be procured or seeds of same?

(3.) What cement is used in constructing an aquarium, where procured, or how manufactured?

(4.) Please refer to some good work or number of American Gardening containing notes of management of an aquarium.—J. W. O., Ont.

—(1.) Yes, but it should not receive too much light.

(2.) The best plants to supply an aquarium with the necessary oxygen are: Sagittaria natans, Ludwigia Malinbertii, Cabomba carolinensis, Myriophyllum spicatum, Ceratophyllum demersum. These can be bought from any first-class aquarist.

(3.) Mulert's waterproof cement is the handiest and most reliable cement for setting the glass in an aquarium frame. The components are a secret; it is for sale at the manufacturer's and in all first-class aquarium establishments.

(4.) A note on the construction of an aquarium is given on page 91, vol. XV. of American Gardening. Get the Amateur Aquarist, which we can supply at \$1.

Our publishers will supply any book wanted. Send your orders.

## P. J. Berckmans.

The name of P. J. Berckmans has for a long time occupied a high place in the horticultural annals of America. As the president of the American Pomological Society, he has been a prominent personage for a number of years, and at this time when that exceedingly useful body has just held its regular biennial gathering (of which a report is found elsewhere), a few words concerning him who has for a decade been its head will not be out of place.

As a nurseryman, the proprietor of the Fruitland Nurseries, Augusta, Ga., has been a very successful business man. The nurseries are on the outskirts of the city and when Mr. Berckmans acquired possession of the property in the year 1856, it was but little better than a barren waste. The grounds altogether cover an area of about 400 acres, 300 of which are under cultivation for nursery stock, besides 40 acres in bearing orchards and vineyards. There is also an acre under glass. The Fruitland Nurseries are the most important and extensive of the kind in the

describing them are familiar to our readers. The firm does not employ agents. A large export trade, particularly to the East and West Indies, South America, European countries, and South Africa, is being developed.

Mr. Prosper Julius Berckmans is a native of Belgium. He came to Georgia in the year 1850, six years prior to assuming the control of his present establishment, where he now has associated with him his sons, Messrs. L. A. Berckmans, R. C. Berckmans, and P. J. A. Berckmans, Jr., all of whom have a life-long familiarity and experience of everything connected with the business, acquired under their father's teaching and surveillance. These gentlemen give their close and active attention to the various details of the enterprise.

Some statistics concerning the nurseries are: 200,000 peach trees, 30 acres entirely given to Roses, including 40,000 of the superb yellow tea Marechal Niel; Palms are in profusion, 25,000 being a moderate estimate; 15,000 Camellias; of tropical trees and shrubs a surprising number may be found, camphor trees, cork oaks,

## FRUITS OF EXPERIENCE.

### JOTTINGS FROM OBSERVATION.

In layering black raspberry tips, especially if the weather be dry, we are careful to bury the tips deep enough so that they will be wholly in the moist earth. But a person can go to extremes in this matter, and bury them too deep, thus causing the roots of the parent plant to be injured in digging the plants.

An ordinary stone mason's trowel is the tool for layering black raspberries. We never tried it until this year and it works a little awkwardly at first, but one gets used to it in a very short time. The trowel is forced into the soil at the angle at which you wish to bury the tip and then drawn toward you while the end of the lateral is placed; then with the fore part of the foot press gently on the soil to firm it.

Watermelons seem to be a paying crop in Michigan this year; the crop is large and prices fair.

Sometimes a home market for berries is hurt for a short time by some grower getting scared about prices, or a little glut in the market, and he sells his load much below the other growers in order to get rid of it quickly. This kind of management injures the market for himself as well as others.

Early Puritan seems to be a promising potato.

The Ninety-day Monarch sweet corn is claimed by those who have planted it to be an excellent sort.

Raspberry plant layering should be practically over now if good large plants for next spring are desired, but if liable to run short of plants, I would rather layer them late than not at all.

The Ridgeway strawberry on our grounds is taking the lead (with the exception of two or three other varieties) for both vigor of growth and luxuriant foliage.

Don't haul that thoroughly decayed manure on the ground until fall rains commence, unless you plow it as soon after applying to the land as possible.

The good qualities of it will more or less be lost on account of the hot sun and drying winds.

Evidently most nurserymen are trying to be on time with their price lists this season, judging from the way they are rolling in.

A sharp budding knife as used by nurserymen and which only costs 25 cents, is as good a tool as can be found for nipping off cucumbers.

Much caution should be used in keeping the chicken houses strictly clean at the time of year when the young are making their most rapid growth.

Farmers are getting a much better price for wheat, and this will probably have some tendency for farmers who have small farms to stop trying to get money out of strawberries and raspberries, etc., thus leaving a more healthy market for those gardeners who make a large part of their living out of small fruits.

Grapes are promising a good crop in Michigan at this time, but not so heavy as was expected.

As soon as the leaves drop the currant hills will be in the best condition to take cuttings from.

If any tree or bush prunings are on the place, now is as good a time to gather and burn as there will be this season.

Very rich soil and heavy crops are what give the profits in vegetable gardening.

Low land when used for gardening should be drained very thoroughly, so that water will run off rapidly after heavy rains, thus leaving the soil porous and much warmer.

If you wish to get a good supply of sphagnum moss now is a good time to gather it.

Remember to mark the grape hills on which you pick the finest fruit of each variety so as to procure your cuttings from them.

CHARLES NASH.

FIG. 181.—PROSPER J. BERCKMANS, LATE PRESIDENT OF THE AMERICAN POMOLOGICAL SOCIETY.

South, and probably at no similar establishment in the country is to be found a wider range and diversity in the products, the climate being particularly well suited to the culture of fruit and flower-bearing trees and plants in variety. Mr. Berckmans grows quantities of fruits for market. Pears, peaches, and plums are shipped North in large quantities during the season. About 80 men are employed during the busy season, and on the grounds are suitable and comfortable dwellings for the work-people. There is a well-arranged packing department supplied with all facilities, and the packing cases are made on the premises by skilled workmen, who have been in the employment of the house for many years and who thoroughly understand their business.

A portion of the grounds is devoted to fruit and plant testing. The variety of trees, plants, and shrubs raised here is very large, and the handsome illustrated catalogues and special wholesale lists

guava, coffee, orange, and lemons, and others of economic value, are to be seen at Fruitland, which is truly well named.

Some idea of the extent of the trade is seen from the figures of the annual output—300,000 to 400,000 fruit trees and 200,000 grape vines.

### Commendable Premiums.

Last spring I received your premium offer No. 45, a collection of Roses. Eleven out of the twelve lived and thrived and have been in continual bloom for the past month and are full of buds now. Please advise me how to care for them during cold weather. Our winters are quite severe, the temperature sometimes falling to 15 degrees below zero.—W. B. LEE.

—Winter protection will shortly be taken up in a lengthy article.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 13, 1907.

PUBLISHED BY

A. T. DELAMARE PTO. & PUB. CO. LTD.

ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt. P. O. Box 1697.

REGISTERED CABLE ADDRESS

Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 35 cents per agate line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## Big Berries for All.

Owing to the pressure of detail in connection with the N. J. State Fair at Waverley, Mr. Jerolaman has not been able to continue his autobiography in this week's issue of American Gardening, in the next number, however, the matter will be continued. Mr. Jerolaman will enter into a discussion of the cultural methods by which he has been able to raise regularly for the New York market the largest berries it has ever received.

## Dwarf Fruit Trees.

IF the correspondence which is received at this office be any index to the evolution of horticultural progress in the mass of our readers—and we suppose it to be so—then it is certain that there is a demand for further knowledge along the lines of dwarf fruit trees. Nor is the desire to become better acquainted with their possibilities by any means confined to one particular section of the country. In response to this indicated want we have, in issues of recent date, given space to a few remarks upon the subject, and have presented illustrations of Cordon and other methods of training, and when last the topic was

touched upon it will be remembered allusion was made to the practice of growing orchard fruits in pots and cursory comments on the results of the system at various places were made. So far as concerned pot culture and orchard house methods adopted at Rockwood, the residence of W. D. Rockefeller, we promised our readers that the matter should be taken up in detail later, and in another column of this issue, the details of the procedure are in some part given. Our frontispiece this week shows a group of fruiting pears and plums in 10 and 12-inch pots, and a peach tree in a 24-inch tub, and on other pages will be seen both a pear and plum in fruit.

There are two very distinct phases of the great fruit-growing problem; on the one hand there is the necessity, which confronts the commercial fruit grower, of producing the most for the least expense, quality of course being understood; on the other hand there is a more or less luxurious class to whom the raising of the finest fruit for their personal gratification is an object not measured strictly by the cost of production.

It is to the latter that our few notes and the illustrations will serve as interesting object lessons. But as a commercial enterprise it would seem that there must be some field for the very beautiful, large, tender, juicy, and early fruits, such as are shown in the photographs. It is an old axiom that the best is always in demand, and if the neighborhood of the larger cities where a wealthy buying community is to be found affords a good cultivator the opportunity to try the experiment, the results may be entirely satisfactory, but of course much depends on local conditions.

While we hold to the above ideas, yet we realize that orchard house fruit culture will probably never be a great industry in this country, owing to the general excellence and abundance of our outdoor fruits, and we have such a wide expanse of country to draw upon. Nevertheless, with the rapid advance of knowledge and wealth, there arises a fuller and keener appreciation of the very finest productions of which our art of gardening is capable; it has been so in older countries, it will be so here. Ornamental gardening has made rapid progress with us and the march is still going on, but owing to the very lavish natural profusion of food articles, attention has not been devoted to the highest development of the cultivator's skill in that direction, we have been quite content to take what nature offered, but did not show great desire to place her out of the influences of vicissitudes of climate and atmosphere where she could do still better. The vegetable raiser has indeed lately realized that a glass structure is a powerful aid to him in his work, and the fruits that grace the tables of the land should be of equal quality with the lettuces and radishes. To this end tends the pot culture of orchard fruits.

## The Village Square.

The model plan which has been prepared for the guidance of Village Improvement Associations and allied organizations is ready for publication, and will appear in the next issue of American Gardening.

## American Pomological Society.

The well-known Iowa nurseryman C. L. Watrous of Des Moines, an energetic and capable horticulturist, was elected at the late Columbus, Ohio, meeting to succeed P. J. Berckmans who has held the office of president for many years.

Other officers are G. W. Campbell, Delaware, O., Vice-president; W. A. Taylor, Washington, D. C., Secretary; L. R. Taft, Agricultural College, Mich., Treasurer. The membership fee was reduced from \$4.00 to \$2.00.

The place of the next meeting is not yet decided upon. The first portion of our special report of the meeting appears on page 632 of this issue, and the conclusion will be given next week.

## The Potato Rot.

BYRON D. HALSTED, N. J.

From the many complaints received and a personal inspection of several potato fields in the state, it is evident that the potato rot is prevalent this season. This disease is caused by a fungus (*Phytophthora infestans*) which is closely related to the downy mildew upon the grape. It first attacks the potato leaves, causing them to curl and become "frosty" upon the under side, after which they quickly turn brown and decay. From the leaves the fine threads of the fungus pass to the stems, and if the conditions are favorable the vines are soon dead and leafless. The potatoes are the last to be attacked, and owing to their size and solidity, may be considerably infested internally with the fine filaments of the fungus before the condition familiarly known as the rot becomes evident. From this it follows that the loss from the decay of the tubers after harvesting the crop may possibly be more than that occurring in the field.

Conditions Favoring the Rot.—The first essential is abundant moisture. Since 1840, when it is thought that the trouble was introduced into this country from South America, the wet years have been the seasons of most rot. A moist atmosphere favors the development of the fungus in the leaves and stems; the rain assists in conveying the germs (spores) from the foliage to the tubers, and the wet soil encourages the growth of the filaments that may have reached the potatoes by descending through the stems. A second favoring condition is warm weather—not hot or cold, but a condition of the atmosphere which obtains when there is a week or month of showery summer weather, often spoken of as "close" or "muggy"—just such weather, in fact, as we have experienced throughout the state for the past four weeks. A large quantity of decaying organic matter, as coarse barnyard manure, perhaps, stimulates the development of the rot, especially if accompanied by favorable conditions of temperature and moisture.

Treatment of Infested Fields.—It is evident that after the vines have been killed there can be no further growth of the tubers, and as the disease first attacks the leaves and tips of the vines and works downward toward, and finally into, the tubers, it follows that there can be no loss in yield, and a great possible gain in healthfulness by early digging. As a rule, the potatoes should be removed from the soil as soon as possible after the vines have been "struck" by the rot. The dead vines abound in the spores of the disease and it is possible for the tubers to be infected by contact with the vines at the time of digging. Therefore, it is an important and inexpensive precaution to rake the vines into heaps and burn them before the potatoes are dug, at the same time destroying millions of germs of the rot, some of which might otherwise do injury elsewhere.

The same conditions favor the rot after as before digging, and, therefore, the dug tubers should be left to dry thoroughly, then the sound ones may be stored where they can be kept dry, cool, and with a good circulation of fresh air. A damp, warm, close cellar favors the growth of the rot. Air-slaked lime, a handful or so per bushel, may be dusted over the fresh-

ly harvested potatoes to destroy any adhering germs.

**Preventive Measures.**—The conditions which favor the rot are not under human control; but knowing the habits of the pest and that it does not usually make its appearance until midsummer, it follows that early varieties of potatoes, when planted early, will usually mature before the rot appears and thus escape. It is also to be borne in mind that a loose light soil does not promote the decay like a clayey one in which the water is held and the air enters with difficulty. From the nature of the disease, it is not expected that any one would think of attempting a second crop upon an infected field until some years have elapsed. Probably much of the trouble arises from the seed not being free from the disease. If possible, the potatoes for planting should be obtained from a locality where rot has not prevailed. The tubers for seed may be soaked in a solution of corrosive sublimate before planting. Some recommend placing the "seed" in an oven for a few moments heated to near a hundred degrees. If possible, plant upon a naturally dry or well-drained soil, and hill up the earth well around the vines at the last plowing, thus giving a good covering to the potatoes and making it less easy for the germs to reach the tubers through the soil. Experimentation may determine that some mixture can be applied to the young vines that will prevent the loss of foliage, and thus save perhaps a half or more of the crop that would otherwise either fall to develop or be lost by the rot. Until then, preventive measures are the only ones to offer.

**What to Do Now.**—The important thing now is, to save the crop or fraction of a crop. To those, therefore, whose vines have died a month or less before their time this bulletin is issued as a warning to not leave the tubers in the ground any longer than possible. Burn the vines; let the potatoes dry out thoroughly in the field or elsewhere, and, if not marketed, store them in shallow bins, etc., in a dry, cool, airy place, being careful that all rotten tubers are excluded. Decayed potatoes should be removed from time to time through the autumn and winter as soon as detected in the bins. A sprinkling of air-slaked lime may be applied as a further preventive of the rot.

### House for Lettuce.

I think of building a greenhouse for lettuce this fall. The house will be 18x50 feet; which is the best, steam or hot water? What size boiler will it take? There will be three benches in the house; should I put pipes under all the benches, or just under the sides or the middle? How many pipes under each bench and what size? I want to start right. Is the Big Boston Lettuce as good for forcing as the Grand Rapids?—ED. SCHRICKEL.

—Hot water should always be used for lettuce culture; steam is not desirable, owing to the quicker and more fiery nature of the heat given out. For such a small house as is suggested, only a small boiler would be needed. But for lettuce, a crop to which heat must be applied slowly, it is better to err on the side of size so that the fire would never need pushing. The pipes need to be disposed in such a manner that they will give off the greatest amount of heat near to the plants without drying them out. In large houses where the plants are grown in solid beds it is customary to have the pipes 18 to 20 inches above the plants. Perhaps in your case, with benches, a 4-inch flow and return down each path would be ample. On the coldest side of the house, perhaps two returns would be advisable. In regard to variety to grow, for the New York and Boston markets, the one almost exclusively used is Boston Market. (See detailed directions in volume for 1895, pages 89 and 135.)

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**Blue Hydrangeas.**—I know some people consider these an abomination, as much so as a double Sweet Pea, but nevertheless, some other people like them. Among the latter benighted heathen I class myself. It is a very simple matter to change the pink *Hydrangea hortensis* to a blue, and a neighbor of mine discovered the fact by a mere accident. One fall she left a trowel accidentally around the roots of a large *Hydrangea*, and the next season it produced blue flowers. As there were nearly a hundred clusters on the bush, it was an exceedingly handsome sight. The next year I imitated her example, and my pink *Hydrangea* has since borne blue flowers. It is not necessary to use iron filings. Any old iron thing by the roots will answer the same purpose.—L. C. L. JORDAN.

—In answer to Dago about iron filings turning *Hydrangeas* to purple or blue, I have tried it with success early in spring at time of potting, and before the buds are set. Take and mix well in soil at time of potting, or use steel filings which will answer the same purpose. I have had the flowers a very dark blue and purple.—Geo. P. MAHOOD.

**The S. A. F.**—In your article entitled "The Florists and Others," page 602, occurs the following: "This result very plainly demonstrated good fellowship does not suffice to carry an election; indeed, this very fact combined with the desire to have one of themselves, won the day for the Washington florist." It appears to me that you are mistaken in your premises, and faulty in your deductions. It is unjust to Mr. Gude to say that he holds aloof from good fellowship, indeed, any one who was present at the banquet in the tent at Newport and heard the cat calls, cries of "Bully boy, Billy," "You're the stuff," "Go ahead old man," etc., and saw him grinning his acknowledgments would not accuse him of want of good fellowship, neither would his adherents be accused thereof; 'tis unjust to both.

Again you say: "To the readers of the American Gardening this will be satisfactory news, for in past years, they have stood aloof from the Society of American Florists, owing to the fact that the so-called social element was reputed to predominate, and the meetings generally balanced up in favor of pleasure rather than profit." That looks like casting an imputation on the retiring officers—president and vice-president, and yet it is conceded that the convention just held in Providence was a most successful one socially. There was more than the usual liberality displayed in the way of entertainment and the retiring vice-president, with the aid of the florists and gardeners of Providence and Newport, aided and abetted by the unflinching zeal of the secretary of the S. A. F., deserve unqualified praise rather than implied censure for their efforts in that direction. That they were fully appreciated by Mr. Gude and his supporters their presence attested. Your claim that it "will be satisfactory news" to your readers, who have held aloof does not seem consistent with your assertion that it was "the desire to have one of themselves," i.e., a florist pure and simple, which "won the day for the Washington florist." This was not catering to the large class of horticulturists—ornamental and otherwise—whom you allege have held aloof, and it was apparently the spirit of class distinction, as shown in the selection of Mr. Gude, which prompted the very disparaging remarks anent the vegetable gardener uttered by his distinguished fellow-townsmen. If the selection of a president was intended to show that others than tradesmen pure and simple could be entrusted with the helm, it failed lamentably, and there is

little inducement for those "who held aloof" on the ground that the society was purely a trade organization to alter their opinion. If the gentleman who was unsuccessful had been elected president, those "who held aloof" on that ground would have no further cause for complaint, because of his well-known connection with the Massachusetts Horticultural Society, which encourages all branches of horticulture. The change of name does not indicate a change of policy; in fact, it was generally understood that Mr. Wood's candidacy was bitterly opposed by the majority of the executive committee, and that several of them personally conducted the canvas against him, this coupled with the desire to maintain the Society on its present lines, not youth and want of good fellowship "won the day for the Washington florist."—LAWRENCE COTTER.

## Water Lilies in Pots.

To the Editor of American Gardening.

As an amateur I have grown many fine plants, but prominent among the best is a plant of Water Lily (*Nymphaea Laydekeri rosea*) which I have grown the past season in a 6-inch pot in an aquarium with gold fish.

It was in full foliage May 1, when it commenced blooming, and has continued with an almost daily succession of its beautiful flowers and foliage, but I intend soon to put it outdoors in order to check its growth and ripen the bulb. The flowers open in the morning and close at night three days in succession, occasionally four times, at the first opening a rose color of delicate shade, difficult to describe, deepening in tint at each successive opening, the deepening shades contrasting as if they were different varieties. There is at all times in sight coming up through the water a succession of flower buds and fine foliage.

I have also grown the *pygmaea alba* in a 4-inch pot, and p. *Helvola* in a 5-inch pot, and the *Zanzibar* varieties in 6-inch pots with fair success. I might add more of my experience in this matter, but I see you are just now issuing a work on the subject which would render unnecessary anything I could say.

FLETCHER WILLIAMS, Newark, N. Y.

[Not at all! We are always glad to hear from our readers any of their experiences. We trust Mr. Williams will not stop now.—ED.]

## Asparagus for July and August.

A correspondent writes: "I have a summer resort for a market and asparagus sells high during July and August. How can I work it to get shoots at that time?"

—Do not cut it in the spring, but cultivate often until your summer resort opens and market is ready. Then mow it off close to the ground and the new shoots will quickly come up. You can then cut clean until middle of August and then let it grow until it freezes. I know of no plant which will bear cutting the tops off as long as asparagus, not even the Canada thistle, but you can kill it in that way. If the tops grow in the spring the roots will get their strength and be ready to force a vigorous growth, provided there be plenty of moisture. The shoots are largely water and if ground dries out they will grow slow, and be very tough and woody. Some scheme of irrigation would be very profitable for it. July and August cutting will soon destroy the vigor of the bed and should be continued no longer than necessary, as the plants must have leaves to digest their food and assimilate it. Every plant without leaves during the growing season is like an animal without air—it's only a question of time as to when it will die.

R. M. KELLOGG, Three Rivers, Mich.

A canvass of the big fruit growers brings to light the fact that the Mason County, (Mich.) peach crop is going to be light. Two months ago it was estimated that there would be 300,000 bushels, but now the most generous estimate is only one-third of that amount.

## PRIVATE GARDENERS.

### Appointments and Doings.

*Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.*

Mr. Richmond W. Husted, late of Tuxedo, to succeed Mr. Harry Hogan as head gardener for Elbridge T. Gerry Esq., Newport, R. I. A Violet house is to be erected, and other improvements carried out.

Mr. Harry Westley as head gardener for I. T. Burden, Esq., "Fairlawn," Newport, R. I.

A. Dimmock, representing F. Sander & Co., St. Albans, England, arrived in New York, Saturday, September 4, per S. S. Etruria.

R. M. Grey, formerly with Henry Greaves, Esq., South Orange, N. J., where he had charge of the famous orchid collection, and later with R. J. Mendenhall, Minneapolis, where he acted as superintendent, is now with Julius Roehrs, Carlton Hill, N. J. Mr. Grey assumed his new duties as foreman September 1.

Mr. David Houston, staff biologist of the Essex County Council, London, England, has been here on a four-weeks' trip, inquiring into the manner and method of teaching adopted, and the subjects taken up by our experimental stations and colleges. Mr. Houston expresses himself as being favorably impressed with what he has seen and heard, and will have much to report to his educational council. He sailed on the steamship Lucania, Saturday, September 4.

### Sales.

A great clearance sale of Palms, Ferns, etc., at Short Hills, N. J., is announced for October 4, 5, 6, 7. Cleary & Co. are the auctioneers.

### Newport, R. I.

Messrs. Robert Christie and John R. Johnson were in Boston last week, visiting the plant exhibition of the Massachusetts Horticultural Society. The former exhibited a plant of his new Canna, Senator Wetmore.

Mr. James Garthley, gardener for H. H. Rogers, Fairhaven, Mass., accompanied by his wife, spent some days here last week.

It will please all the friends of the Club to know that after paying its bills in full, and Florists' and Gardeners' Club and Associates were left with a balance on hand.

### New Orleans, La.

Park Superintendent Jules Fonta of Audubon Park has just returned from a pleasant and profitable trip to California, where he went in the interest of the Audubon Park Commissioners. Mr. Fonta said that he had traveled considerably over portions of Europe and the United States, but had never before been as far west as California. He thought that this last trip had taught him more than any other he had ever taken for the same purpose.

Mr. Fonta left the city July 2 in company with Mr. Panter, gardener for Mrs. T. G. Richardson.

### New York.

The work of laying out a Colonial garden surrounding the old Van Cortlandt Mansion in Van Cortlandt Park was begun August 11 by Samuel Parsons, Jr., Superintendent of Parks. Five thousand dollars was appropriated for this work by the Park Department, and according to the plan prepared, the garden will have numerous narrow paths, with artistic designs, bordered with low boxwood hedges. The flower beds will be in various shapes and forms and planted with old-fashioned flowers. One of the larger beds will be in the form of a flag and have red, white, and blue flowers.

The interest shown by the Park Board in this work is very gratifying to the Colonial Dames of the State of New York, in whose custody the old mansion was placed some months ago and who on May 27, 1879, celebrated the 250th anniversary of the landing of Gov. Peter Stuyvesant on the Island of Manhattan by opening the mansion as a public museum.

Although the smallest free museum in the city, it is by far one of the most interesting, especially to the lovers of Colonial relics.

### St. Paul, Minn.

We recently visited the private garden and conservatories of J. J. Hill of this city. These are in charge of L. G. Venke. He grows a general line of plants and cut flowers and has one house of grapes which are well set with fruit and nearly ripe. He has a fine collection of Orchids—one of the best in the city. A large Allamanda attracted attention from its immense number of blossoms and the surface covered by the plant. It is evidently several years old and is trained against the wall.—VERITAS.

### Boston.

The annual plant show of the Massachusetts Horticultural Society on September 1 and 2 was fully up to the high standard established by its predecessors, both halls being filled to overflowing with exhibits of a high order. The upper hall was devoted to potted plants and the lower hall to cut flowers.

Among the plants, which were not large as a rule, were some especially fine specimens. The crowded condition of the hall at these exhibitions and the difficulty of getting large plants in the hall have combined to influence exhibitors to bring their small or medium-sized products.

Among the largest plants were the palms entered for the prize calling for a pair in pots or tubs not more than 24 inches in diameter, the first prize for which was awarded to James Wheeler, gardener to Joseph H. White, Esq., on Phoenix rupleola. The first prize for pair in 14-inch pots was awarded to Kenneth Finlayson, gardener to Dr. C. G. Weld, on Acanthophoenix crinita and Licuala grandis. The largest prize and one in which much interest centered was for a collection containing foliage plants of all descriptions not to exceed 40 plants in pots or tubs and the first prize was awarded to William Donald, gardener to J. S. Bailey, on an especially nice lot of stock. Noticeable in this exhibit were the following: Palms, Kentia Forsteriana, K. Belmoreana, Areca lutescens, and Rhaps humilis; Marnatas, Makoyana, Illustria, Veltchil, Vanden Heckel, and roseo-lineata. A number of choice ferns including davallias and adiantums, among which were two very fine Farleyense, and an unusually good specimen of Alocasia Sanderiana, which was also awarded the Society's medal. The first prize for six greenhouse plants was awarded to N. T. Kidder, Esq. (William Martin, gardener) on Livistona rotundifolia, Sphaerogyn latifolia, Clerodendron Balfouri, Alocasia macrorhiza variegata, Dieffenbachia Bausei, and Cyanophyllum magnificum, all good specimens. The first prize for single specimen flowering greenhouse plant was awarded to C. H. Souther (Sandford, gardener), on a fine specimen of Anthurium Brownii. The first prizes on six fuchias, for collection of flowering plants grouped for effect, ornamental foliage plant; six ferns, no adiantums, and for five varieties of adiantums named, all went to James Wheeler. William Martin received first prize on six named varieties of caladiums. The first prizes on four lycopods, six named dracaenas, and six named crotons were all given to Kenneth Finlayson. D. F. Roy, gardener to E. S. Converse, Esq., received first on six pots of Begonia rex, six varieties, and the first on collection of Begonia rex hybrids was awarded to George B. Green, gardener to J. M. Little, Esq. The first on collection of not less than ten named varieties of cannas in pots or tubs went to John Jeffries (Anderson, gardener). First prize on specimen cycad to James Little, Esq.

The cut flower show was also superb, the largest quantity and finest quality of dahlias in all their types being shown that has ever been seen here. The chief exhibitors in this class being John Parker, Lothrop & Higgins, H. F. Burt, L. W. Snow, William C. Winter, and John Endicott & Co., among whom the honors were divided. Kenneth Finlayson took first on tropæolums, and John L. Gardner, Esq. (William Thatcher, gardener), received first on French and African margolds. E. Sheppard & Son were first on double zinnias. Oakes Ames, Esq. (Carl Blomberg, gardener), and L. W. Goodale of Dwight, Mass., made extensive exhibits of aquatics. Henry A. Dreer, Inc., sent on his new Nymphaeas Gurneyana and Doogueana; they came by mail, and unfortunately did not arrive in very good shape; the last mentioned, which bears the name of the superintendent of Boston's public grounds, is a magnificent lily of chaste and delicate coloring, flowers five and one-half to six inches in diameter, beautifully cup-shaped, and of a pleasing shell-pink color with sepals of royal pink, a symmetrical distinct flower and a valuable acquisition to the hardy nymphaeas.

### Where Shall Our Future Supply of Bulbs Come From?\*

This is a very easy question to ask, a very easy one to answer offhand, but to give you the necessary data and reasons for the conclusions at which I have arrived at is somewhat difficult in the time allotted for this purpose. I judge that this question refers principally to Dutch, French, Bermuda, and other foreign-grown bulbs, and to such we will confine our attention.

Our Holland friends tell us what is known as the Dutch hyacinth cannot be grown here, as we have not the soil or climate. If there is a file of the reports of the New York Horticultural Society in existence I believe you will find therein a report of a display of cut bloom of hyacinths made by the late Isaac Buchanan. These flowers were raised from bulbs which Mr. Buchanan grew on his place at Astoria, L. I. He bought some bulbs in the Fall, cut them as the Dutch do for multiplying, grew the stock on until they had made large bulbs, then forced them into bloom, and took the first prize over a number of exhibits grown from imported stock. If they will not grow here, why will they continue to thrive in private gardens where they are left for a long time? I know of one bed that was left undisturbed for over ten years, and I have never seen finer spikes of bloom outside than were produced there. This was in a very heavy soil, and the claim is made that the hyacinths require a light soil to make the best stock. I have seen as fine tulips grown here as come from Holland, the bulbs were clean and of perfect shape and produced as good flowers the following season as newly imported stock.

The narcissus does even better here than the tulip, multiplies very rapidly, and is in every way equal to the foreign stock. There are several sections of this country that can produce the freesia in unlimited quantities and of the best quality. Now as to the Roman hyacinth, both white and colored. Mrs. Sayers, wife of the chairman of the committee on appropriations at Washington, told Mr. William R. Smith not to send her any more Romans, as they had become a weed in her garden which is in Texas; and still we are told that we cannot grow Romans. Several years ago 20,000 blue Romans were received in New York in a damaged condition, having been delayed on the steamer. When the cases were opened the bulbs were found to have started and were unfit for sale; they were shipped to Southern Pines, a high elevation known as the Thermal belt in North Carolina and planted; the following season those bulbs were sold for forcing purposes, and they did so well that the parties who grew them asked the next year for bulbs from the same source, without knowing they had been grown one year

\*C. H. Allen, before Society of American Florists.

# Potash.

An absolute necessity for every crop.

in this country. It has been proven that lily of the valley can be grown in this country profitably, for several of our large forcers have gone into it on a large scale for their own use, they having imported small pipes to grow on. This importation would be unnecessary after a few years, as the stock will increase sufficiently for planting. Why have we not grown these bulbs? Simply because we have believed the foreigner when he has told us that we had neither the soil nor climate suitable for the purpose, merely a case of bluff; for they know full well that we have any soil or any climate or any combination of soil and climate for the growing of any bulb that the florist of this country needs for his business. It is partly due to the fact that when many horticulturists come to this country, they bring pre-conceived ideas with them. There are thousands of acres of land here suitable for growing hyacinths. North Carolina has in her uplands the identical soil of Holland and a superior climate. The narcissus and tulip can be grown in nearly every state.

Some time ago the question was brought up before the New York Florists' Club, Can the Lillium Harrisii be grown at a profit in this country? The same question has recently been brought out in one of our trade papers. I judge from the answers of those replying that they believe they can be. But where? That is the question for some plucky fellow to find out. My friend, Mr. William R. Smith, informs me that Secretary Wilson has had this subject brought to his attention, and that he has taken great interest in the matter and will push it. As the secretary is a full-fledged agriculturist, you can rest assured that if he can put several hundred thousand dollars into the hands of the land workers of this country, he is going to do it, for that is the platform on which he stands.

It is claimed that Harrisii culture has been tried in California but without success. By whom was it tried? Was it one who thoroughly understood the nature of this lily, differing as it does from all others? Or was it simply given to some persons who thought they were perfectly capable to handle any bulb given them? Was the trial made in only one section of the state, or was it made as it should have been in different parts and under different conditions of soil and climate?

Is it not a fact that two or more growers receiving bulbs from the same case for forcing obtain vastly different results? I know of one instance where a case was divided between two men; the crop with one was of the best, while the plants of the other were all diseased and worthless; thus it may be in case of trials. One man thoroughly understanding the requirements of the Harrisii will produce excellent results; his neighbor will make a

failure of it. It is also claimed that foreign cheap labor is a prime factor against our growing bulbs. A Frenchman told us twenty-five years ago that we could not compete with them in the gladiolus growing, their labor was so much less than ours. How many gladioli are imported to-day? It would surprise many of you if you knew how many are being exported annually. It is not so much that their labor is cheaper, as the fact that they plant their crops much closer and thus obtain double the amount from a given space.

Many florists who have tried growing a few of these bulbs have given it up in disgust. Why? They had not the facilities for handling the stock. The man who grows an acre of any bulb can do it much cheaper proportionately, than one who grows but one short row; for in handling crops in large blocks the work becomes systematized. The market gardener who works but a few acres often produces more than the ordinary farmer does from a hundred because he manures heavily and obtains two, and in some cases, four crops, and this can be done in some lines of bulb culture. I know of one case where a farmer began in a small way at trucking, and to-day he employs men on seventy acres, obtaining two crops every season, while his neighbors are going along in the same old rut (with a few exceptions).

I thoroughly believe that if the matter of bulb growing in this country is handled as it should be, by those who fully understand the nature of bulbs, it will only be a few years when the foreign bulb growers will receive their letters of recall from this land; but you must remember that they will not give up the business without a struggle; they will do everything in their power to hinder the establishing of this as they have every other industry, knowing only too well that if

#### Deafness Cannot be Cured

by local applications, as they cannot reach the diseased portion of the ear. There is only one way to cure Deafness, and that is by constitutional remedies. Deafness is caused by an inflamed condition of the mucous lining of the Eustachian Tube. When this tube gets inflamed you have a rumbling sound or imperfect hearing, and when it is entirely closed Deafness is the result, and unless the inflammation can be taken out and this tube restored to its normal condition, hearing will be destroyed forever; nine cases out of ten are caused by catarrh, which is nothing but an inflamed condition of the mucous surface.

We will give One Hundred Dollars for any case of Deafness (caused by catarrh) that cannot be cured by Hall's Catarrh Cure. Send for circulars, free.

Sold by Druggists, 75c.

an American undertakes the producing of any article in which there is a show of profit that he is bound to succeed. Some say that at the present prices it would not pay to grow stock that we import. I will ask you to use a little time to figure out what you can get from an acre of lily of the valley, planting the pipe one inch apart in rows ten inches apart; freckles the same and the other stock, having more space according to their size. I believe that you will find the amount far beyond your present ideas.

#### Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 100, New York City.

#### FOR SALE.

# The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

## ALL ABOUT THE HOME PLOT

### POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

#### Care in Potting Bulbs.

A good, well-composted soil is the first requisite, after obtaining good bulbs. Innumerable directions are given for preparing such soils, and, if one has no access to loam, field or compost heap, the florist will supply every need with the exact soil medium needed. But, even to put the bulbs into the pots properly requires some skill and judgment. With the hard bulbs which throw a large bunch of fibrous roots, the chief mistake made is in making the soil too firm below the bulb, through thrusting the latter deep into the soil by main force. This gives the roots less chance to take hold than they might otherwise have, and makes sure that the bulb shall be thrown out of the soil when the mass of roots demands room. It is better to pot firmly about and above the bulb, but very loosely below it.

#### Satisfaction from Bulbs.

Horticultural writers make it a business to say that there is nothing else equal to bulbs for giving winter bloom. Yet, the fact remains that hundreds are disappointed just along this line. This is partly due to poor bulbs, partly to inability to follow directions, and largely to time of potting and choice of sorts. Late potting deliberately invites failure and dissatisfaction. A haphazard collection of sorts is likely to be more than half failure, and the more varied the collection the greater the failure. Only a few of the smaller bulbs and the novelties should be tried each season. The old reliables are not so interesting, perhaps, but in them lies the most of beauty and of satisfaction. Lilies, the better Hyacinths, the Narcissus, the Alliums, and the Freesias are best choice for the average grower.

#### The Lesser Bulbous Families.

The list of bulbs for winter planting has grown to be a long one, and question is often made as to the reason for the neglect of many of the lesser sorts. One active reason is that many persons are so fond of Lilies and Hyacinths that these receive first consideration always, and often there is no money left to buy the others. It is not that there is less beauty in the less-known families; indeed, to some eyes, the fantastic beauty of a Calochortus may be far greater than the well-known charms of the Hyacinth. But, somehow, the Hyacinth is a must-have, the other only a may-have. There is a world of pleasure in growing these lesser bulbs a few at a time, and for variety's sake. But Crocuses, Scillas, Borneas, Babianas, and most of the little-grown bulbs often prove more or less failures, while the Tritelesias, pretty and long blooming as they are, do not make show enough to attract much attention. It is well worth while to try a few of the neglected ones, if only for the sake of knowledge.

#### Farfugium and Begonia M. Aurea.

The Begonia manicata aurea is often contrasted with the old "Leopard plant," because they are of similar general appearance. Both are beyond praise, when at their best; both are frequently seen in condition to belie any praise. Poorly grown, either is a source of pain to the most careless beholder. The Farfugium often suffers from too strong sun heat, and, while most flower lovers know perhaps that the Begonias dislike strong sunshine, this particular sort has been seen during the present season undergoing torture of this sort at the hands of its friends.

#### Russelia Juncea.

He shows hardihood, indeed, who dares to say of any one plant that there is nothing else so beautiful for some especial purpose. Even of the most beautiful specimen of the acknowledged queen of flowers one might not make such a statement without contradiction. Yet it is of that novel plant, Russelia juncea, that the sweeping statement is made that

there is nothing so beautiful for large vases. Judging from the behavior of a single plant, in one set of conditions, one might say that no plant was less worthy of such strong praise. Such judgment is a mere straw, however, and, unfortunately, it is from the reports of such "tests" that a novelty usually gets its early reputation.

#### Lycopodiums.

These pretty plants, so little known to the rank and file, deserve wider trial by those who can depend on themselves not to neglect their plants. They are excellent for filling and bordering in decorative work, and very useful for jardinières. Like Palms, they must never be allowed to become dry at the root, as a single experience of this sort is fatal to their beauty. A shaded position with plenty of moisture meets their needs, and best of all, they do not displace a north window. Their lively green and the peculiar style of their foliage also commend them as giving pleasing variety to any collection. Some show a surface like shot silk, some are fern-like; some are entirely of a golden tinge, while others show white tips to all the growth. Plants so beautiful deserve something better than neglect.

#### Scoring One's Own Fowls.

It is the suburbanite, of all men, who is sure, sooner or later, to reach the point where none but the pure-bred fowls will satisfy his poultry-loving soul. Values and scores at once become the all-important things. Shall he—can he score his own fowls? If this means "Can he score them to sell?" he may find help in the discussions lately so hot in the accredited poultry authorities. It is not often that a single man is favored with so much scoring by opposers, and so much free advertising as has fallen to one man during the past season, because he tackled high scores to his birds without mentioning to possible customers that the scores were his own. That he may have been innocent of blame cannot change these facts.

#### An Honest Private Score.

A certain free lance among poultry writers asserts, dogmatically, that every breeder making a specialty of a single breed is intelligent enough to give honest and correct score cards with the fowls he sells. This is a safe statement enough in one of its aspects, if any one could discern the connection between intelligence and honesty. But no man with ordinary human nature in his breast can be relied on to give a correct score card for his own birds, even though he be honest above the average. It is too sure to be, as an expert breeder confessed a short time ago, in a private talk: "I found that my birds, scored carefully by myself, nearly always lost a point or two at the hands of an unbiased judge at the shows. I could not help giving them the benefit of the doubt every time." Breeders need to score their birds, especially if commercially inclined, but they need experts to verify those scores when it becomes a money affair to some buyer.

#### The Point of View.

Money in poultry? The battle rages around the question as to whether or not it exists. The Western man, whose feed is cheap, and who gets the lowest of prices for the products is the one who does the most complaining; who makes the most cynical remarks. The South often takes up the same strain, while we of the North often hear that Southern poultry kills our trade. Just lately, another form of the problem has come to the surface. A Florida fruit and poultry raiser shows up the difficulties in his way, affirming that feed and freights are so enormously high that eggs pay no profit, even though sold at 25 to 40 cents a dozen. Chicks pay some profit, he admits, but affect the question but little, on account of the limited market. The strangest part of all, however, to those who like to throw discredit on poultry, is that the same man who denies a profit from the more valuable products, as usually considered, states that he finds the manure alone of so much value as to warrant a continual increase of his flock. Nothing could show more clearly that in every location there

is some compensation to balance great drawbacks, and that one must be informed of all the facts before he is competent to form any opinion whatever. A wrong point of view produces always a false conclusion.

#### So Many Chickens.

"What a lot of chickens there are everywhere," was the remark of a city visitor in a farming neighborhood. And it is true, that on nearly every farm the flocks have been increased. But even yet suburbanites cannot be sure of fresh eggs without producing them at home.

# WHOLESALE MARKETS.

## New York.

The approach of the holiday last week found the market filling up rapidly with stock of every description, much of which was of a very inferior grade. This overcrowding of stock on Friday and Saturday reduced prices considerably, for in no way as the demand commensurate with the supply. A few special marks on Saturday morning early shot up ahead of quotations, especially on peaches. But the spell was brief, stock afterwards falling to extremely low figures, and later in the day, in order to clear out, any kind of an offer had to be accepted. Those who held back carried stock over with the result that on Tuesday, this with new stock, was on hand to make a still greater slump. For Tuesday all day trade was at a very low ebb and much stagnated after the holiday of Monday.

Plums are selling low and so far preservers have the best of the market, being able to buy at practically their own price.

Potatoes are a little more irregular with a tendency to fall in value.

Apples—Duchess of Oldenburg, hand-picked, d.-h. barrel, \$2@2.50; Gravenstein, hand-picked, per d.-h. barrel, \$1.75@2.50; Holland Pippin, hand-picked, d.-h. barrel, \$1.50@2; Fall Pippin, hand-picked, per d.-h. barrel, \$1.50@2; Twenty-ounce, hand-picked, per d.-h. barrel, \$1.75@2.25; Codling, hand-picked, per d.-h. barrel, \$1.75@2.25; Blush, hand-picked, per d.-h. barrel, \$2@2.50; mixed varieties, poor to good, per barrel, 75c. @ \$1.50; Missouri, mixed varieties, ordinary, 75c. @ \$1.25; Virginia, fall varieties, per barrel, \$1.50@2.50; crab apples, small, choice, per barrel, \$2@3; large, per barrel, \$1.25@1.75.

Peaches—Maryland and Delaware, per carrier, 75c. @ \$1.25; extra, per basket, 70@80c.; prime to choice, per basket, 40@60c.; common to fair, per basket, 25@35c.; Pennsylvania, per 20-pound handle basket, 30@50c.; Jersey, extra, selected, per basket, 60@70c.; selected, choice, per basket, 40@50c.; fair to good, per basket, 20@35c.; culls, per basket, 15@20c.

Pears—Bartlett, large, clean, per barrel, \$1.75@2; poor to fair, per barrel, 75c. @ \$1.25; latersorts, fair to good, per barrel, \$1@1.50; common kinds, per barrel, 50c. @ \$1.

Grapes—Delaware, up river, per 24-pound case, 60c. @ \$1; Niagara, up river, per 24-pound case, 30@75c.; Moore's Early, up river, 24-pound case, 40@50c.; Worden, up river, 24-pound case, 40@50c.; Concord, up river, per 24-pound case, 40@55c.; Champion, up river, per 24-pound case, 30@40c.; black varieties, up river, per 8-pound basket, 10@12c.; Jersey, per 8-pound basket, 10c.; Jersey, per 5-pound basket, 5@6c.

Plums—Damson, per quart, 2@3c.; table varieties, state, 8 to 10-pound basket, 16@20c.; common blue, state, 8 to 10-pound basket, 12@16c.; Gage and Reine Claude, state, 8 to 10-pound basket, 18@20c.; common green, state, 8 to 10-pound basket, 12@16c.; up river, one-half bushel crates, 50@60c.; Quackenbos, per barrel, \$1.50@2; Purple Gage, per barrel, \$1.50@2; egg, per barrel, \$1.50@2.50; Reine Claude and Green Gage, per barrel, \$1.50@2.50; Damson, per barrel, \$2@2.50.

Watermelons—Nanticoke, extra large, per 100, \$16@18; Jersey, large and fine, per 100, \$12@15; Virginia, large, per 100, \$10; small to medium, per 100, \$4@8.

Muskmelons—Hackensack, Nutmeg, per barrel, \$1@1.25; Monmouth County, Nutmeg, per barrel, 50@75c.; Jenny Lind, per barrel, 75c. @ \$1.50; south Jersey Gem and J. Lind, ordinary, 50c. @ \$1; Maryland and Delaware, per bushel basket, 40@60c.; per one-half barrel basket, 50@75c.

Celery—Choice, large, per dozen, 30@35c.; fair to prime, per dozen, 20@25c.; small and poor, per dozen, 8@15c.

Corn—Hackensack, per 100, 75c. @ \$1.25; other Jersey, per 100, 50@75c.

Cabbages—Jersey and Long Island, per 100, \$2@3.

Cucumbers—Jersey, per bushel box, 25@50c.; Long Island, per 100, 50c. @ \$1; hothouse, per 100, \$1.50@1.75; pickles, state, per 1,000, \$1@2.50; pickles, Long Island, per 1,000, \$1@2; pickles, Jersey, per 1,000, \$1@1.75.

Egg plants—Jersey, per barrel, 75c. Green peas—State, per bag, 75c. @ \$1.25.

Lima beans—Jersey, Potato, per bag, 75c. @ \$1.25; near-by, flat, per bag, 50@75c.; south Jersey, flat, per bag, 50@60c.; Maryland and Delaware, Potato, one-half barrel basket, 75c. @ \$1; Maryland and Delaware, flat, one-half barrel basket, 50c.

Onions—Jersey, white, per barrel, \$2@3; other kinds, per barrel, \$1.25@2; Orange County, red, per bag, \$1.25@2; Orange County, yellow, per bag, \$1.25@1.75; Orange County, white, per bag, \$1@2; Long Island, yellow, per barrel, \$1.50@2; state and Pennsylvania, yellow, per barrel, 1.75@2; Ohio, yellow, per barrel, \$1.75@2; Eastern, white, per barrel, \$2.50@3; Eastern red, per barrel, \$2@2.25.

Peppers—Jersey, per barrel, 50@60c. Squash—Hubbard, per barrel, \$1@1.25; marrow, per barrel crate, 75c. @ \$1.

String beans—Long Island, per bag, 40@50c.

Tomatoes—Choice, round lots, per box, 60@75c.; ordinary, per box, 30@40c.

Turnips—Russia, per barrel, 75c.

Potatoes—Long Island, in bulk, per barrel, \$2@2.25; Jersey, per bag, bag included, \$1.75@1.90; choice, round, in bulk, per barrel, \$1.87@2; average prime, in bulk, per barrel, \$1.75; poor to fair, in bulk, per barrel, \$1.87@1.50; yellow sweets, Virginia, per barrel, \$1.25@1.37.

## Philadelphia.

All kinds of both fruit and vegetables continue in good supply, buyers are rather scarce and low prices prevail as a consequence.

The quality of peaches has improved over that of the past few weeks, but it is still below the average of past years.

Grapes are becoming very plentiful, and selling very slowly. Sales are so poor that quotations are useless.

Apples—Oldenburg, hand-picked, per barrel, \$1.75@2; Gravenstein, hand-picked, per barrel, \$1.50@2.25; Maiden's Blush, hand-picked, per barrel, \$1.50@1.75; Jersey mixed, per barrel, \$1@1.25.

Pears—Bartlett, choice, per barrel, \$3@3.50; fair to good, \$2@2.50; Clapp's, per barrel, \$1.25@2.

Peaches—Pennsylvania, Cumberland valley district, per carrier (six baskets) \$1.25@1.75; per handle basket, 40@50c.; regular basket, 40@55c.; per bushel crate, 85c. @ \$1. White fruit selling best. The foregoing constitutes the bulk of stock now in this market. There are some Maryland and some from upper Jersey, but above prices cover all.

Plums—Green Gage, 10-pound baskets, 15@20c.; seconds, 10@12c.; table varieties, 10-pound basket, 18@25c.

Watermelons—Choice, per 100, \$10@15; seconds, \$7.50@9.

Muskmelons—Jenny Lind, per barrel, 75c. @ \$1; mixed, per barrel 40@60c. Gem, per barrel, 60@80c.; the quality of all melons is poor and sales slow.

Beets—Jersey, near by, per 100 bunches, \$1@1.25.

Celery—Choice, per dozen, 25@40c.; fair to good, 15@20c.

Corn—Jersey, per 100, 75c. @ \$1.25.

# A Builder's Experience.

## A USEFUL LIFE RENEWED

## IN AN REMARKABLE MANNER.

**Udney Y. Wilson Was Near Death's Door. Doctors Failed to Help Him—A Nemo Remedy Succeeded in Saving His Life.**

*From the Evening News, Detroit, Mich.*

Udney Y. Wilson, contractor and builder, living in Detroit, Mich., at 87 High Street, West, said, regarding Dr. Williams' Pink Pills for Pale People: "For years I have been out of doors in all kinds of bad weather, looking after my building contracts. I have worked many days in the rain and cold to complete some building. About two years ago I noticed I could not get around as I should, and commenced to have a severe pain in my back. I tried the usual remedies without getting any relief, and for nearly a year I suffered intensely. I kept up as long as I could, as I had several contracts for buildings that had to be completed.

"At night I could not sleep. My physician said it was my kidneys, and every day I went outdoors they would keep me awake nearly all the following night. Instead of getting better I became worse, and worried a great deal about my work. The doctor said I must quit work and go to bed, or he would not be responsible for my life.

"All the medicines I took only helped me temporarily. Some days I would feel better and go out a day, only to be again confined to my bed for weeks at a time. One day my wife suggested that I try Dr. Williams' Pink Pills for Pale People, and I laughed at the idea.

"Finally when I got into such a condition that I would take almost anything in the hope of relief, I tried the pills. They helped me from the start, but I would not acknowledge it and said it was the other medicines that had just commenced to work. I disliked to own

up that Dr. Williams' Pink Pills helped me, as I had no confidence in them. When I could not carry on the imposition any farther, I told my wife that the pills were helping me. I took three boxes before I was entirely cured, and we now keep them in the house all the time.

"I am not prepared to say that Dr. Williams' Pink Pills for Pale People will cure everything, but I know they will cure kidney troubles and general muscular weakness, as they cured me.

"I now recommend them to every one in my neighborhood, where I formerly made sport of all proprietary remedies."

U. Y. WILSON.

Subscribed and sworn to before me, a Notary Public, this fourth day of March, 1897.

ROBERT E. HULL, JR., Notary Public.  
Wayne County, Michigan.

Dr. Williams' Pink Pills for Pale People contain, in a condensed form, all the elements necessary to give new life and richness to the blood and restore shattered nerves. They are an unfailing specific for such diseases as locomotor ataxia, partial paralysis, St. Vitus' dance, sciatica, neuralgia, rheumatism, nervous headache, the after effect of la grippe, palpitation of the heart, pale and sallow complexions, all forms of weakness either in male or female. Pink Pills are sold by all dealers, or will be sent postpaid on receipt of price, 50 cents a box, or six boxes for \$2.50 (they are never sold in bulk or by the 100), by addressing Dr. Williams' Medicine Company, Schenectady, N. Y.

Cabbages—Per 100, \$2@2.50.  
Cucumbers, Jersey, per barrel, 50c.@ \$1; pickling, per 1,000, \$1@1.75.

Sweet potatoes—Per five-eighths basket, 35@50c.

### Boston.

Peaches are now arriving from New Jersey, Maryland, Connecticut, Pennsylvania, and Michigan. The car from Michigan being the first from there this year. Prices very little changed from those ruling last week. In the six-basket carriers fancy fruit \$1.75@2. In the 20-pound basket 65@90c.; while the so-called Delaware peach basket brings 75c.@ \$1.20.

This city has not recuperated from the glut of apples here last week; and there are yet quite a few cars in transit; a range of general Western stock would be \$1@2, with some fancy Gravensteins \$3, and other choice red fruit \$2.25@2.75.

Pears in large supply; choice Bartlett's being sold \$1.75@2 a barrel; all other varieties meet a low price; whenever customers can be found willing to make a bid.

Large heavy-weight watermelons only fair demand 14@15c.; small sizes not wanted, even at low figures. Cantaloupes, home stock, in excellent demand, there being so many varieties prices range all the way from \$1@4 a barrel; choice Emerald Gems bringing \$4, with black Japs \$2.50@3.50, white Japs about \$1.50, and muskmelons not over \$1. Montreal stock nearly done and prices even firmer than those of last week. This week there will arrive a carload of those fancy Rocky Ford Nutmeg melons, grown in Colorado; the samples so far seen are of excellent quality, and the trades jump over each other in their haste to make purchases; some Baltimore black Japs packed in 60-quart berry crates bring about \$2.50.

Green corn very plenty, consumption large; excellent demand.

Quite a large call for home-grown tomatoes, with prices running 50c.@ \$1 a bushel; fancy solid red stock bringing the latter price.

Egg plants dull, scarcely anybody asking for them.

Peppers are quiet at around \$1 per barrel.

If customers are looking for mushrooms, they still bring \$1 a pound.

New Brunswick blueberries 5@8c. a quart.

Celery very steady, limited demand.

Fine Marrow squash finds ready sale at \$1.50 a barrel; home-grown stock is of excellent quality.

Potatoes very firm; at the railroad selling 65@75c. a bushel; some barrelled stock from Long Island bringing \$2.25@2.50 a barrel; sweet potatoes firmer, quick demand \$1.75 a barrel.

Cucumbers did not grow this year like other seasons; for table use about three-fourths of a cent a piece, if for pickles, \$1.50@2 per bushel.

Cabbage, as good demand as usual at this season, 3@5c. a head; limited demand for cauliflower.

Onions are easier, \$1.75 if in large-sized barrel; while Ohio stock being in small barrel brings but \$1.50.

Carrots 2@2½c. a bunch.

Pineapples and peas gone by; mint 40c. a dozen bunches; parsley 75c. a bushel; Lima or Selva beans, \$2 a bushel.

Plums arrive in large quantities and take a range of prices of 10@20c. in 10-

HEADQUARTERS FOR ALL PRINTED SUPPLIES

# THE HENRY

## The Most Wonderful Strawberry of the Age.

**M**ESSRS. STEVENS, SIMPSON & CO., Commission Merchants, 232 West Street, New York City, state they handle the HENRY Strawberry, and have realized for it the highest price obtainable for any outdoor stock coming into New York market. Mr. Simpson further states that, in his opinion, as grown, packed and shipped by Mr. Henry Jerolaman, it is the BEST HOME MARKET BERRY in existence. For SIZE, COLOR, and SWEETNESS, and, in its KEEPING QUALITIES, IT HAS NO EQUAL; these many points in its favor rendering it easy for the grower to realize considerably more per quart than the regular market value of Strawberries generally.

**M**R. JEROLAMAN says, and his statement is corroborated by others, that the HENRY is beyond all doubt not only the strongest plant, but the largest, best, hardiest and sweetest Strawberry ever yet produced; its color, dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. . . . It will out-produce any Strawberry plants that I have ever known, four-year old plants giving very large and just as fine berries as plants one year old. . . . The plants as yet have shown no disease. . . . It is the first berry ripe and the last.

Read about it on Preceding Page.

## READ THIS FIRST

The publication of the below article in a recent issue of **AMERICAN GARDENING**, has brought Mr. Jerolaman hundreds of letters from every part of the country.

### Strawberries Henry and Mary.

We have grown almost all varieties of berries, but have only found two really large fruited ones. The one is Mary, originated by the late H. Alley of this village, the other is called, here on Boyden Farm, Henry. We grow tens of thousands of quarts from each variety every year, and they are without doubt the largest and best of all grown in the whole world. I have had this season thousands of quarts of Mary, where from five to ten berries would make a heaping wooden quart, and I have preserved several in glass jars, with formalin, so that all who doubt can come here and see for themselves. Some of these berries in the jars measure thirteen inches around. I am the present owner of the Seth Boyden farm. Seth Boyden originated the first large strawberry, perhaps, in the world (Agriculturist and others); he died in 1870. I then bought his farm, and have continued to grow strawberries from that time to this, and will say that I am positive the plant called Henry is, beyond all doubt, not only the strongest plant, but the largest, best, hardest, and sweetest strawberry ever yet produced; color dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. I have grown it for the past four years for market in a small way, and this season nearly one-half of all that I grew was Henry; it will out-produce any strawberry plant that I have ever known, four-year-old plants giving very large, and just as fine berries as plants one year old. The plants as yet have shown no disease, while all other varieties, such as Great American, Jersey Queen, and nearly all varieties except those soft berries not good for market (Sharpless, Bubach, and others), have shown disease in the plant. The Mary this season could not stand the hot sun, and nearly one-half of all the plants burnt and dried up while full of berries. Mary will not bear the second season, but must be set every year, while of Henry, not a single plant has died, either old or young; it is the first berry ripe and the last. I am picking large berries from the Henry to-day, July 15.—HENRY JEROLAMAN, N. J.

Mr. Jerolaman will not answer any further correspondence except through the columns of **AMERICAN GARDENING**.

## YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

THROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of **AMERICAN GARDENING** have become possessed of the story of the life and cultural methods of **Henry Jerolaman**, undoubtedly the **STRAWBERRY KING OF THE UNITED STATES**. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of **AMERICAN GARDENING**. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us **One hundred thousand plants of the HENRY STRAWBERRY**, to be used solely as premiums to subscribers to **AMERICAN GARDENING**. The Henry Strawberry has positively never before been advertised.

### THE CONTRACT

*Publishers American Gardening.*

*Gentlemen,*

*I hereby agree to furnish you within the next twelve months in quantities as ordered, One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold.*

*Witness*

*Thos D. Cothurny.*

*(Signed)*

*Henry Jerolaman.*

### The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of **AMERICAN GARDENING** has brought him hundreds of inquiries from the cream of the professional growers.

### A GOLD MINE AT YOUR OWN DOOR,

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one strawberry grower in every town, village, and hamlet can come into a good thing through practising the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

### Taking Advantage of Our Offer:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid.

**FIVE PLANTS** ..Of the.. **HENRY STRAWBERRY**  
Unequaled

And **AMERICAN GARDENING** One Year.

Present Subscribers are entitled to this Offer on renewal; if their subscription has not expired, it will be dated ahead.

Plants to be shipped this Fall or in the Spring, as you prefer.

Mr. Jerolaman's story will be found in the first issues mailed you and his cultural methods will be published in time to be of service for Fall planting.

### OFFER EXTRAORDINARY

For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, **Five Plants of HENRY STRAWBERRY**; at the same time we will also send **Five Plants** to the party subscribing through you. Thus a club of 10 new subscribers entitles you to 50 plants of this wonderful Strawberry, as well as each individual subscriber to 5 Plants. This is a **BIG OFFER** to all who want to become larger holders of this wonderful Berry, never before advertised. **Time is short, get to work to-day.**

Address **Publishers AMERICAN GARDENING, P. O. Box 1897, New York.**

## Trial Subscriptions

For \$1.00 we will send **AMERICAN GARDENING** on three months' trial (13 weeks) to four separate addresses, and as a premium, **Five Henry Strawberry Plants** to the one getting up the club. **HUSTLE.**

FIG. 182.—A RED OF PINK CUPID SWEET PEA AS SEEN IN JEFFERSON CO., N. Y.

## The Fruit Garden.

**Grapes.**—With us Early Ohio is a very good black grape, after the Concord style, and perhaps has too much of the foxy flavor to suit some tastes, still it is very acceptable as being one of the first to ripen—seven to ten days before Moore's Early—the berries adhering firmly to the stem.

Moore's Early, a much better quality grape, is ripe here about September 7. The best black is Worden, ripe about the third week in September. This, although a slender grower will well repay for liberal treatment in the line of fertilizing. A fine berried variety is Eaton, ripening just before Concord, the vine is a poor grower.

A favorite red grape is Brighton, ripe

a little before Worden, and with or directly after Delaware, and a far better grower; its only fault, if it may be called one, is that the berries do not color evenly, which fortunately does not affect their sweetness.

Lindley is a close second to Brighton, excepting that it does not set enough berries to make a shapely bunch. Moyer is too small in every way.

Salem, a peculiarly flavored grape, makes grand bunches when the vines are young, and gives best results when grown on the renewal system.

Moore's Diamond is very satisfactory, and is, I think, our best white, looking at it from every point of view. Vines hardy as Concord and comparatively free from mildew; a second early, but bunches

will hang for a very long time on the vines.

Of course we have to grow Concord, Hartford, Delaware, and Catawba also, as the names are familiar to the older members of the consumers, who to-day order Concorde and get Concorde and others for the same article.

Cultivation should be stopped among young trees, except to keep down weeds, giving the wood a chance to ripen.

The Picking of Apples will soon be in order, and where the crop is not extensive the work should be detailed to two pickers who will make better work if the blame for poor work cannot be shifted over onto some one else.

JAMES HOLLOWAY, N. Y.

## Twenty-Fifth Session of the American Pomological Society.

[Special report for AMERICAN GARDENING.]

(Concluded from page 632.)

### Relation of the Society to the National Division of Pomology.

Col. G. B. Brackett, Iowa, the recently appointed Chief of the Division, urged the utmost harmony between the two as the work of both is along similar lines. The Division seeks to obtain information regarding new varieties and improved methods from all parts of the world, and by means of its bulletins and circulars disseminates this knowledge to the fruit growers. It is equipped by government appropriations, and should be beneficial directly to the public; on the other hand, the Society derives a meagre income from its membership fees, and its work is necessarily more circumscribed. The Society in the past has done valuable work, but pomology has grown beyond the means of the Society. The Division is provided with ample means, and directed by practical men it can do much good. During the past year it has prepared and printed the fruit list for the Society. All fears that the Division will endeavor to absorb the Society are groundless, as the Division is willing to give full credit to the members of the Society who aid it in its work.

Prof. H. E. Van Deman of Virginia, claimed to have been the originator of the Division, having suggested the idea to Secretary Norman J. Colman, and as the first chief of the Division, mapped out the line of work that should be followed. In the past many pomologists have, unrequited, from love of the cause, spent their lives for the benefit of pomology, but public work should be done at public expense, and when at the head of the Division he had arranged for the co-operation of the department in preparing and printing the fruit report of the Society at government expense.

C. L. Watrous of Iowa spoke of the benefits that were also given to pomology by the botanical, entomological, and mycological divisions of the Department.

### What Shall We Seek Abroad?

This question was answered by W. A. Taylor, assistant in the Division of Pomology, who stated that although the list of edible fruits and nuts about to be issued by the Society showed 1,112 varieties, belonging to 57 species, many of the foreign countries have undeveloped species that will be well adapted to cultivation in some place in our country, either as fruit trees or as stocks upon which to grow other kinds. He then gave a long list that seemed promising, including a number of palms, pineapples, eugenias, chestnuts, bananas, myrtles, plums, cherries, oranges, lemons, and various species of Ribes, Rubus, and Vitis.

Prof. Van Deman stated that in addition to the large number of native species and the many foreign species that had been introduced, there were many others that we should secure. He called particular attention to the many hardy and promising fruits found in Armenia, and which could be introduced to advantage.

Prof. Berckmans and Prof. Craig of Ontario reported that they had tested peaches, plums, and apricots from Armenia, which had been carefully selected as most promising, but none of them had any value here.

At this point the Secretary of Agriculture, Hon. James Wilson, appeared in the hall, and on being presented to the Society, pledged himself to do all in his power to benefit the pomological interests of the country. He was well aware that there were many things that the individual fruit grower could not do for himself and government aid is necessary and proper. The government is now trying to secure refrigerator service that will carry our fruit, butter, and eggs from the gulf ports to all parts of the world. They have already arranged for the careful transfer of perishable products at New York to refrigerators in the trans-Atlantic steamers, so that dairy products can be shipped to London. He had just returned from the West and had in Colorado inspected the orchards about Grand

Junction. In addition to a climate adapted to the growing of the peach and other tender fruits, they are blessed with a soil composed of the aggregated washing of the finest particles from the surrounding mountains, which has been going on for ages, and they have been able to lead out the water from the rivers and thus convert what was previously a desert into an earthly paradise for pomologists. In many parts of the West the land can be had for nothing, the water of the rivers is free, but by carrying the water upon the land the latter becomes worth \$100 per acre, and when planted to orchards, will readily sell for \$1,000 per acre, and yet they ask the fruit growers of the East to allow themselves to be taxed to supply water for irrigating, with which this immense profit can be made, and also enable them to grow fruit with which they will compete with the Eastern fruit grower in the markets. In conclusion he promised the Society the hearty co-operation of the Department of Agriculture.

### The Present Status of Spraying Apple Orchards.

Fifteen years ago, said Professor W. J. Green of Ohio, orchardists began first to spray for the apple worms, then came the use of fungicides for the apple scab, and finally came the use of a combined insecticide and fungicide. As long ago as 1891 spraying was generally thought to be profitable, but since that time many have abandoned spraying. In 1895 the unsprayed fruit was as fair as the sprayed, and in 1896 an abundant crop was obtained without spraying, and the prices were so low that in 1897 little spraying was done.

Not only will spraying preserve the apples from scab, but the June drop is reduced, as it prevents the attack of the scab on the blossoms and young fruit. In years when rain prevails at the time of blooming, there will often be no crop of fruit on unsprayed trees, while the sprayed trees will have a full crop. The loss of a crop from lack of spraying will in such a season often amount to thousands of dollars, as they would sell for a high price. The present year the trees of most varieties bloomed profusely, but few fruits set where the trees were not sprayed, while sprayed trees have a full crop. The unsprayed trees are almost defoliated by the scab and are in poor condition to develop fruit buds for next year. Even though they may bloom, they will be so weak that they cannot bear a good crop.

The apple worm cannot always be killed by spraying, and many orchardists are of the opinion that it does not pay to spray for it. Many have the same idea regarding the canker worm, but by spraying in time and thoroughly, it is not difficult to control. Comparison of sprayed orchards with unsprayed will show that it has paid from 500 to 1,000 per cent. Even though little effect can be seen, the benefits from a single year will often repay the cost of spraying for ten years. Those who make apple growing a business spray their trees and find it profitable.

Prof. Alwood had good results from spraying the trees in the early spring with concentrated lyediluted to 3 degrees Baumé, and then sprayed three times with Bordeaux mixture and Paris green, and had averaged from 30 to 50 per cent. of a crop, when unsprayed trees gave but 2 per cent.

L. A. Goodman made use of geared machines, but found it necessary to use large air chambers holding 20 to 30 gallons, so that he could stop between the trees and spray them thoroughly.

### San Jose Scale.

Needed state and national legislation for the suppression of the San José scale was discussed by Prof. Alwood of Virginia. This insect was thrust upon us at the East, through the introduction of new varieties of fruit trees from California. Had the danger been at once recognized, the injury would have been much less. It has now become so scattered in some states that it can only be eradicated by concerted action of the growers and the state and the national government. Because of the life history of the insect, it

is difficult to destroy, while its obscure nature aids it in escaping detection. It is so persistent that unless it is destroyed by some effectual application, a plant once attacked will almost certainly be killed by it. Only such remedies are effectual as will destroy it by contact, or that will smother it. The use of hydrocyanic gas is quite effectual upon nursery trees, but is not reliable for orchard use. Its insect and fungous enemies will aid in holding it in check, but will not be able to destroy it until the trees have been ruined and the insects scattered. The rapidity with which it propagates is another reason why it is so dangerous. Howard and Mariatt found by experiment at Washington, that the progeny of a single female scale would number in a single season 8,416,080,000, if all lived to maturity.

This insect is so likely to be distributed on nursery stock that state and national legislation is necessary. The law should clearly define the authority which should be vested in a board, with power to appoint a responsible inspector, who should have the right to go upon any premises to inspect suspected trees, and the power to quarantine within the state. It should also outline the full machinery for carrying out the law and of enforcing penalties, against selling or giving away infected stock. The state authorities cannot take cognizance of stock in transit from one state to another, as that would interfere with interstate commerce, while the national law would not take cognizance of cases actually existing in a state. Both classes of laws are then necessary, and with them it will be possible to secure the rigid inspection of orchards and nursery stock, so that the insect can be eradicated where it has established itself, and be prevented from spreading to uninfested sections.

A paper covering somewhat the same ground, entitled "Insect Legislation: Can it be Beneficial and Practical without being Detrimental?" was read by Prof. F. M. Webster, of Wooster, O.

Many of the more restrictive state laws have been found unconstitutional, as they interfere with interstate commerce, and for this reason state laws cannot be entirely effectual unless we have a strong national law. We need a national law to control stock subject to interstate commerce rules, and a rigid state law that will take cognizance of cases occurring in orchards and nurseries, and they should be so prepared that they would be uniform in different parts of the country.

### Fertilizers and Fruitfulness.

Dr. R. C. Kedsie, of the Michigan Agricultural College, read a paper on "Fertilizers and Fruitfulness." The early botanists and chemists considered the gases as of the utmost importance in supplying food to plants, while the elements found in the ash were thought to be of no account, but now potash, phosphorus, lime, sulphur, and magnesium are considered the philosopher's stone. The union of theory and practice has done much to aid our fruit growers to so feed their orchards as to secure paying crops of fruit, but many even now do not understand the importance of the mineral elements. Of the 70 known elements, nine are found in the ash of the plant and come from the soil; but not all of these even have to be applied to enable the plants to secure a supply—four are generally found in sufficient abundance in the soil. Of the five remaining two are of supreme importance, as occurring in small quantities in the soil and required in large quantities by the plants, they are quickly exhausted from the soil. These elements are potash and phosphorus, and so supreme is their importance that with nitrogen they constitute the "Tripod of Pomology." Other elements are in such abundance that they need not be considered in selecting commercial fertilizers.

Yard manure is a complete fertilizer and is the best we have for all purposes. It is especially rich in nitrogen which is of great importance in promoting the growth of plants. On the other hand, too much of it produces a rank growth of leaf and stem, with a dark green color. If with it potash and phosphoric acid are

combined in proper proportions, the growth becomes firmer.

Potash is required for the formation of starch, and many of the carbon and nitrogen compounds cannot be formed without its presence. An abundance of potash secures short-jointed shoots.

Phosphorous stands close to life and is required for all living processes. The more highly organized the plant, the more abundant must the phosphorous be.

Potash and phosphorous are the leading constituents of the ash of young plants, and later on they aid in hastening the ripening of the wood, and promote the formation of flowers and fruit. They may cause fruitfulness in two ways, by promoting the formation of flowers, and by giving potency to the pollen.

When there is a check to the growth of a plant or animal, indicating that its end is nigh, reproduction is most rapid. Thus the ringing or girdling of a tree by retaining the sap in the top aids in developing fruit buds. The pollen or the male element varies in its potency in the fecundation of flowers as shown by Waite\*, in his experiments with the pear. He showed that the Bartlett is self-sterile, but that it has sufficient potency to fertilize other varieties. Pollen is very rich in

#### Root Galls.

Prof. A. D. Selby, of the Ohio Experiment Station, attempted to solve "The Root Gall Problem." This complaint affects our fruits over wide areas. The growths are morbid and tumor-like, such as might be expected under the action of some irritant upon the cells. They consist of swelling on the roots and stems that can often be readily separated from them. They are found on the apple, pear, plum, peach, raspberry, blackberry, and Carolina poplar. When on the roots or at the collar they are sometimes found on the stem. At first while fresh they are soft, but become quite hard on drying, and the exterior becomes hard and warty. From the fact that they are most often found on the roots, or at the collar, they are commonly called "crown galls" or "root galls," but the word gall is apt to be misleading, as it is also commonly applied to swellings about an egg or larva of an insect. The cause is as yet an open question. Professors Woodworth and Toumey think it contagious, while E. F. Smith, of Washington, thinks it may be due to some irritant. Careful microscopical examination does not reveal bacteria or fungi present, that could cause the swelling, while the cutting off of the galls from the collar and sterilizing the wound,

hopelessly confused, as many of them have been grown from seed for a long period, and in this way various "races" have been established. Thus with Yellow Transparent could be grouped Nally and Charlottenthaler, while there are many forms resembling Duchess of Oldenburg, including Pointed Pipka. In the Anis family there are at least ten types, among which are several that are quite hardy and valuable at the north. The Apport or Alexander family is of little value, as they drop badly, do not ship well, and are of poor quality. In the Switzer family is Switzer, which is very handsome and better than Oldenburg in quality. Many of the Russian varieties are summer sorts, free bearers, and hence, short-lived.

Several promising seedlings have been produced which are long keepers. The Russian varieties are most promising north of the 45th parallel and as parents of hardy sorts.

#### Election of Officers.

When the time came for the election of officers, President Berckmans declined re-election, and as stated in last issue, C. L. Watrous, of Des Moines, Ia., was chosen to succeed him; George W. Campbell, of Delaware, O., was made first vice-president; W. A. Taylor, Washington, D. C.,

FIG. 183.—SINGLE PLANT OF PINK CUPID SWEET PEA. (See page 630.)

nitrogen, as analyses show an average of about 16 per cent. of crude protein in the pollen of pines, and of 28 per cent. in that of the alfalfa. The production of such an amount of rich material must be very exhausting.

There are many interesting problems to be worked out regarding the potency of pollen that will affect the feeding of the plants. Among them are: Whether the pollen of the same species varies in its potency at different times, or whether it always has the same relative potency, and whether the pollen from weak plants will be as potent as that from strong ones.

Pollination secures the setting of the fruit and the amount of pollen used modifies its form and size. Thus Waite not only found that by crossing he was able to secure far more fruits, but their size was also increased, and the same results were obtained by Munson, of Maine, with the tomato. If the potency of the pollen be low, the development of the fruit will be slight. No pollen, no fruit. We should then provide our plants with a ration of food so balanced that it will promote a firm growth and provide for the development of a large amount of pollen of a high degree of potency. Then and not till then can we secure large crops of handsome fruit.

\*Bulletin 6, Division of Veg. Path. Dept. of Agriculture, The Pollination of Pear Flowers.

or the severing of the galls upon the smaller roots does not prevent their reappearance.

It was found in one case that when apparently healthy trees were planted in a raspberry plantation where eel-worms or nematodes were present, that galls were found the next year, and this would indicate that the nematodes may have caused the development of the galls, but this does not explain why the galls form on the stem, or why they reappear when they have been cut off.

A nursery tree bearing galls is worse than worthless, as it will not come to fruiting, nor will an older plant continue bearing if attacked, while it is likely to spread the disease. The trouble seems to spread, and is more serious than any insect or disease now known. Affected nursery trees are the chief source of contagion to new orchards or new land, and should not be sold. The presence of the disease can be readily detected at digging time, and all affected trees should be collected and burned. Trees in close proximity to diseased trees are also likely to become infected and should not be used.

#### Russian Apples.

Prof. Craig, of the Ontario Experiment Station, had on exhibition a number of plates of Russian apples, illustrating the different families. He stated that the nomenclature of the Russian apples is

secretary; and L. R. Taft, Agricultural College, Mich., treasurer. Mr. Berckmans had served the Society as president for ten years, having succeeded the lamented Marshall P. Wilder, and resolutions were adopted expressing the regret of the Society that he had declined re-election.

#### Next Meeting, Fees, Etc.

Invitations were received to hold the next meeting at Niagara Falls, N. Y., St. Louis and Kansas City, Mo., Omaha, Neb., and Boston, Mass.

The membership fee of the Society was reduced from \$4 to \$2. The question of holding annual instead of biennial sessions was left with the executive committee.

#### New Fruits and Awards.

Wilder silver medals were awarded to George W. Campbell for the Campbell Early grape, and to H. G. M'Pike, Alton, Ill., for the M'Pike grape, a seedling of Worden, with large, bluish-black berries, a thin skin and tender pulp, sweet, and of good quality, foliage very strong and healthy; season with Worden. Said to be very hardy and productive.

There was also on exhibition the collection of Russian apples referred to above, and specimens of the Diamond peach, and the Hunt plum, a seedling from Iowa, supposed to be a hybrid between a European and some native species. (This was

commented upon on page 618, September 4.)

Jonathan Periam, of Chicago, also exhibited a number of the newer Cannas including Italia, Burbank, Yellow Crozy, Kanst, and others; and E. H. Cushman, of Euclid, had on exhibition a number of seedling Gladioli, including the May.

### Some New Boilers.

In continuation of our previously published remarks upon recent improvements in boiler construction, we present, by the courtesy of the manufacturers, a few details on the latest production of the well-known Messrs. Hitchings. The boiler that has made the firm's name famous is now, to a large extent, superseded by the present model of very recent introduction, and known to the trade as "No. 57."

The boiler is equally serviceable under either the open circulation or the high-

width 49½ inches, length 76½ inches, weight, 4700 pounds, height to center of flow sockets is 59¾ inches, to center of return sockets 28¾ inches. The sizes and positions of flow and return sockets may be varied to suit special requirements. The boiler is provided with grates suitable for the consumption either of egg or pea coal as may be preferred.

In order to give some idea of the actual work accomplished by this boiler, we will refer to the establishment of Mr. F. Boulton, Sea Cliff, L. I., who has enlarged his violet-growing plant by the addition of three new houses, which are planted to 6,000 Marie Louise. The houses are built in the most approved modern style and are very conveniently fitted in every way. They are of the following dimensions: The center house is 22x150 feet, and the two side houses 10x150 feet. The heating of these houses is done by Hitchings & Co.'s new pattern sectional No. 57 boiler, and in addition to these new

### Chrysanthemums.

Plants are now needing attention on every hand. Side shoots and suckers seem to spring up in a night, and as quickly as they are removed, others appear to take their places. Constant attention is necessary to keep the energies of the plant concentrated on the bud. Begin at one end and by the time you get through you can begin over again.

All Buds Must be Taken as soon as possible, nothing that is not needed should be left on the plants for even a day if possible. September so far has been a bright sunny month, which will be a great help in ripening the wood, and the good effects of this will be seen when the flowers expand.

Feeding.—Sulphate of ammonia is my favorite chemical manure, and used very carefully, it gives splendid results. It

FIG. 184.—INTERIOR OF THE BOILER SHOWN ON OPPOSITE PAGE.

pressure system, each boiler being tested under a high pressure before leaving the factory. These boilers, the firm says, have been in use during the past two years under heavy service, and have proved themselves equal in efficiency and in economy of fuel to the widely known "Corrugated Firebox" boilers, and have the especial advantage of being "sectional," which admits of their being easily handled.

The boiler has nine water sections, each section subjected to a hydrostatic pressure of 100 pounds to the square inch, the joints are of the same material as the boiler (best cast-iron of high tensile strength), accurately fitted and are absolutely indestructible. The grate has 8¾ square feet of surface; the fire-box is deep, with adjacent chambers assuring perfect combustion. The draught is regulated by a graduated cold-air damper to suit various chimneys and the work to be done.

The length of No. 57 boiler is 62 inches,

houses, this boiler will, in moderate weather, heat a large proportion of the entire establishment, and is connected so as to relieve other boilers.

Other houses already planted with violets are: One, 12x100 feet, filled with the Princess of Wales; three others, 10x40 feet, with the same variety; one house, 14x50 feet, contains Lady Hume Campbell; another house, 30x80 feet, is filled with Swanley White, Farquhar, and Lady Campbell, while five other houses, 12x60 feet, are filled with Marie Louise, and about 400 feet of cold frames with California, thus making 20,000 plants in all.

We solicit from our readers notes of experience and observation. While our space is limited we will always manage to make room for any communication that contains germs of real, practical value to fellow-subscribers.

deepens the color of the flower and brightens up the whole plant. It can be used stronger when plants are accustomed to it, but half an ounce to three gallons of water is enough to start with.

Golden Wedding should be isolated from other varieties, if possible, so that it will not get so much syringing. It is the worst variety for mildew that we have, and this must be kept down with sulphur if the foliage is to be kept good.

Insects.—Black fly seems to become numerous again as the year advances. This must be kept out of the buds from the first. Fumigate lightly and often, in the evening putting air on again last thing.

Grasshoppers are troublesome in this section just now, eating out the points just below the bud. The best time to catch them is in the early morning, as they seem paralyzed till the sun warms up the temperature. C. TOTTY, N. J.

## The Vegetable Garden.

**Asparagus Rust** is now making its presence known by the premature decay and brown appearance of the tops. When affected, care should be taken to check the disease, or serious results will follow another year. The simplest and easiest method to do this is to have the tops on the ground after cutting them down, then on a dry day setting fire to them. The whole beds should be carefully burned over to kill the spores, if there are not enough tops to do this, any rubbish, such as old hay, straw, dry leaves, should be lightly spread over the beds and fired.

**Potatoes** should now be all dug out of the ground, and placed in a cool cellar or outside pit. The crop is rotting badly this year, and to prevent this as much as possible, look over the tubers on stormy

## Some Late Nectarines and Peaches.

**Victoria Nectarine.**—The value of this variety evidently cannot be overestimated; its charming color, great size, and late ripening makes it one of the most valuable fruits of its kind. Another strong point in its favor is its bearing qualities. Several trees seen this season have had enormous crops of perfect fruits. A recently noticed tree was in the fruit houses on the Osborne estate at Mamaroneck, N. Y., to which Mr. George Winslade, the superintendent, pointed with pardonable pride; it is bearing abundantly, but fruit is barely ripe as yet.

**Stanwick Seedling** is another good late nectarine. A tree of this is also bearing profusely at this time with fruit just

## Hot House Grapes.

Will you kindly inform me through your next issue what one-half dozen grapes you would recommend for growing under glass, hothouse kinds? W. R. M., Canada.

—In selecting six kinds of grapes for indoor purposes we should certainly take the following: Black Hamburgh, Muscat of Alexandria, Buckland Sweetwater, Gros Colmar, Alicante, and Madresfield Court. The last-named is one of the handsomest of late black grapes despite its tendency to crack. But this can be overcome by growing a little dryer. Buckland Sweetwater is not always certain, so that we would make the list five rather than six. The selection covers the whole season and they ripen in the order named.

FIG 185.—HITCHING'S NEW SECTIONAL TUBULAR BOILER.—(See opposite page.)

days, picking out any that are rotten or wet.

**Onions** should be turned over every few days, and any which show signs of growing should be picked out and used up first. Onions keep best if placed on a shallow bench in a cool airy room.

**Tomatoes.**—Pick off all ripe fruits, also all those that are rotting, and destroy the latter. W. M. EDWARDS, Conn.

### Beans Diseased.

(To J. McK.)—The bean pods submitted are badly attacked by mildew.

### Fruits for Name

(To H. J.)—The plums are Satsuma, one of the Japanese kinds.

(To H. M. L.)—The apple sent is Gravenstein, an old and well-known variety in the North.

ripening. Among late peaches Prince of Wales is the most showy, making, as it does, a large high-colored, well-proportioned fruit.

Early peaches and nectarines have been a great success in the houses on the Osborne estate this season and they embrace all the best varieties.

### Killed by Poison Ivy.

Mrs. Mary King, aged 69 years, died on September 7, at her home in Chester, N. Y., from the effects of ivy poisoning. She came in contact with a poison ivy vine early in July, and her whole system seemed affected by the poison.

"Are College Professors Contented?" will be discussed by Professor Bliss Perry, in the October Scribner's.

### Cucumber Forcing.

I write for information about raising cucumbers. Can they be raised in spring about March in a hothouse 10x17 feet heated by a stove?—J. M., Mass.

—Such a house so heated can be made to produce cucumbers readily with the usual precautions against red spider, etc.

### Home Grounds—How to Lay Out.

This supplement contains a half-tone drawing (6½x10½ ins.) of an estate of about six acres; this plan, together with the accompanying explanatory text, presents in a nutshell all the salient points of landscape gardening.

With the aid of this plan, and by careful study of its suggestions one can lay out an estate of one acre or fifty acres, for we give the cardinal principles which govern the art so clearly that all can understand.

Printed on heavy paper and forwarded, securely packed in a cartoon, on receipt of price, 25 cents, or given as a premium for one new subscription.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 18, 1894.

PUBLISHED BY

A. T. DELAMARE PTO. & PUB. CO. LTD.

ROSE AND DUANE STS.,

RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious). Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per agate line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## WANTED.

Copies of AMERICAN GARDENING for March 6, 1897. Address the Publishers.

Concerning the Cupid Sweet Peas.

WHEN first it was announced that a new race of dwarf Sweet Pea had sprung into existence a considerable amount of excitement was manifested throughout horticultural circles in Europe as well as in our own country. The possible value of this new arrival was largely discussed in the columns of AMERICAN GARDENING, at the time, and it must be allowed the evidence produced was of a very conflicting nature.

In the year following the introduction of the original White Cupid Sweet Pea, the appearance of another dwarf pink flowers began to be spoken of, and the introducers, Messrs. W. A. Burpee & Co. of Philadelphia early this season distributed among horticulturists a few seeds of the pink variety for trial. It has been noticed that while the Cupid Sweet Peas have not been so well favored in this country, the European gardeners have reported most favorably upon them, and it has been argued that though the plant did well on the Pacific Coast it would not hold up on the Atlantic seaboard. In view of recent experiences of our own, it is well to ask. Why this suggestion? It would seem that those who

have reported adversely upon these novelties have been judging from a wrong standpoint—that of the cut flower grower, as is evidenced by the communication which appeared in our issue of July 17 last (page 502). Again, there have doubtless been errors of cultivation or treatment.

The demands of the decorative horticulturist are for many other plants than those which furnish flowers for cutting, and each one has its place; the evergreen shrub for perpetual greenery and life in winter; the grass plants to make a lawn as a setting for the flower beds; the ornamental foliaged plants to give color to a formal design; each has its use, and while each subject affords a mine of pleasure and satisfaction in its proper place, disappointment is sure to follow its improper application, and herein do so many mentors of horticultural opinion and taste fall into error.

That the Cupid Sweet Peas have suffered by just such conditions is apparent. The plants are essentially bedders—flowering bedders—and we are convinced by a recent experience in Jefferson County, N. Y., that properly used in its own sphere, the dwarf Sweet Pea is to be placed in rank with other first-class plants of that type. No one grumbles at the Portulaca, yet it is but a flowering bedder, and how valuable in quiet suggestion are these Cupid Sweet Peas can only be realized by an actual inspection of such a showing as is represented in our frontispiece illustration in this issue, which is an actual photograph of the pink Cupid bed referred to in the foregoing remarks.

The effect produced by thus massing in an area, 50x40 feet, was astonishing to one who had before seen but a few isolated plants. Not only was the color fine (it is that of Blanche Ferry Sweet Pea, from which the pink Cupid has sported), but there was added the shading and blending of the hues of rosy pluk as the sun's rays glinted across a sheet of blooms in all positions, some full on, some sideways, there was moreover the ever welcome fragrance of the Sweet Pea wafted on the breeze.

And this matter of fragrance is not by any means a minor detail, though occasionally in our modern rush for "development," we are liable to sacrifice that prime quality to other considerations of size, form, and color. For was it not the fragrance that first called man's attention to the original Lathyrus odoratus? the name itself tells us so; and is not the Violet's chief charm in its odor?

A German contemporary has in a recent issue attacked the pink and white Cupid Sweet Peas and after reproducing certain discourteous allusions of a native seed firm, to "strictly American pompous recommendations" goes on to relate the same author's remarks that the plant is a "dwarf garden vetch," which it certainly is not. It further "to complete the different expressions of opinion" quotes from AMERICAN GARDENING the sentences referred to in the first part of this note, and leaves the reader to infer that it was the expression of the paper itself. We object to that, and the Handelsblatt of Berlin will oblige by accepting with our compliments the present expression of opinion of the merits of the Cupid Sweet Peas.

The owner of the bed of pink Cupids which is shown on page 645, informed us that the seed was sown 2½ inches deep in hills 2 feet 6 inches apart, and the whole then treated as a hoed crop. The soil was a heavy cold clay loam, and had received a surface dressing of lime, but this application can hardly have had much influence on the plants which were perfectly at home, flowering profusely—we counted 121 stalks in blossom on one plant and an average of three flowers to the stem. The health and vigor of the plants were fully demonstrated by the hundreds of seed pods from flowers already overpast, and though still carrying so freely there were buds innumerable yet to expand. The height of the plant was six to eight inches, and the spread generally two feet, while occasionally one would run to 30 inches and even more, while the individual blooms measured across the standard 1¼ inches.

The claim that Cupid seed had a low figure of germination has not been borne out by our experience and observation. Given the proper conditions, the Cupids are all right.

## Henry Strawberry Premium Plants.

The greatest success has attended our offer of this enormous berry; evidently our readers know when a good thing is offered! All those to whom plants are due will get first-class plants in good order, but there has been some delay this past week because Mr. Jerolaman very properly would not ship plants during the late exceptionally hot weather. Our readers will appreciate the care. He also desires us to state they need not to be in a hurry to set out plants.

"I never set out plants in hot or dry weather, for it is certain death to them, and the best-paying crop for the labor expended on it was set during the month of October, 1896. The space was 75 feet by 150 feet, strict measure 11,250 square feet, only a trifle over one-quarter acre, yet from this space I sold nearly \$400 worth of berries this last June and July. I have set out plants during eight months in the year, and always wait for wet or cool weather. The plants that I set out in October and November or until the ground freezes are full-grown plants from July or August runners. Removal in these months injures the plants but little, and they never wilt nor wither. Indeed, I find the most profit in plants set in these months, for there is then no care of them all summer and fall, as is the case with plants set out in April, May, or early in June, and moreover there is no profit from early set plants until the following season."—H. JEROLAMAN.

## Obituary.

Jesse Kersey Sharpless, the originator of the Sharpless Strawberry, died at his home in Catawissa, Pa., on September 10. The deceased was in his 80th year, having been born September 3, 1818. The berry which bears his name is one of the best known of all the host of strawberries, and was raised from mixed seed of Jacunda, Charles Downing, Wilson and Col. Cheney. The originator practically lost control of the plant before the merits of the variety were realized, and he is reported as having realized on it about two thousand dollars.

F. E. McAllister, the seedsman, formerly of Dey st. and lately of Cortlandt st., New York City, died September 14. He started in the seed business in 1845, in Fulton st., subsequently in 1886 removing to Dey st. Mr. McAllister did a general business in seeds, supplies and implements, and claims to have been the first man to import English holly and mistletoe for decorative purposes.

## BIG BERRIES FOR ALL.

Being the Cultural Methods of Henry Jerolaman, the N. J. Strawberry King, Preceded by an Autobiography.

Continued from page 619.

During my last year's stay on the farm, our father made a proposition to my elder brother (Nicholas), and myself, to the effect that if we would, with the bog hoe, clean off in winter a certain piece of bog meadow (that had been thoroughly drained during the past summer), burn the bogs, plow, and cultivate the land, he would give us all the corn we could grow on it the first, or next, season. After consulting with my brother who was always willing to do as I said (he always drove the oxen, I the horses), we agreed to take the land and during the winter at odd times cleared it, plowed it in spring, and grew upon it the next summer a first-class crop of corn.

This bottom land was very rich, and I will say here I believe such the best kind of soil on which to grow a heavy or first-class crop of strawberries; if sour, then the only thing needed is about 50 bushels of air-slacked lime to the acre, costing about 6 cents per bushel, or about \$3 per acre, and after plants are set a top dressing on each side of the plants with about 10 two-horse loads of well-rotted stable manure to the acre. If I or any one cannot grow on such land thus prepared at least \$800 per acre at 10 cents per quart, why call me anything you like (provided always that there is a near-by market).

After selling our corn in fall we realized \$60, \$30 each, after paying all expenses. I only remember positively this amount; that I never shall forget; but as to area of land cultivated, I think it was about two acres, certainly not more.

It was always the custom for father in fall to give each of us a good suit—Sunday suit of clothes we called it, made of the best sattinett procured at Woodhouse's fallen mill in the valley, but on this occasion when we asked father for the suit of clothes his reply was, "Why, where is your corn money? What have you done with that? Get your own clothes if you want any."

I saw at once that father knew too much for us boys, we had always been under the impression until then that we knew more than father (most boys do). I have a son who thinks he knows more than twice as much as I do, and the only time I believe he thinks differently is when he comes to me in order to borrow money. I suppose it is all right, as the American people are going forward not backward.

It was with sadness and anger that I told my brother our corn money was "a goner," or in other words, if we did not want to play angel, we would have to buy some clothes with the corn money. This made us form a committee of one, I being spokesman, to inform father that we would leave him and earn our own living.

I distinctly remember getting in a safe position before I informed father of our intention, but he knew we were in earnest, and kindly told both of us that if we would stay another year, he would move to Mendham, as he had bought the hilltop (Fairchild's Boarding School), as it was then called (with some money left to him by my grandmother). After moving to Mendham we went to school in the brick academy at that place. I did the best I could, studied all the time I could get, and crammed my little head as full as I could—too full, perhaps, for it must have overflowed, for I was always forgetting anything useful, but can remember to this day anything that was useless. Moral: let your children study only such books as will be useful to them in their occupation. Oh, how well I remember how my head would ache on a hot day, and at such times I almost always wanted to die, as I believe all lazy folks do when compelled to work. Many a child lies in its grave through overstudy.

If you have noticed I have as yet not said one word about my pedigree, I never liked to recall it myself and never cared for one, and suppose others are like me in

that, but I will state that on my mother's side I am pure English, on my father's side Dutch all the way through. This, I think, is a good strong combination, and perhaps sustained me in my studies. In botany I would be called a hybrid, and I think it a good thing—I know it is in strawberries. The Henry plant is a hybrid, being crossed with two of the best, largest, and hardiest plants known, and if I had the power to originate a new and hardy species of the human race, I think I would get an Eskimo and cross with the Dutch. But it matters not whether I am high bred or low bred, I know I am capable of teaching those who wish to grow strawberries and will do so, in AMERICAN GARDENING.

We resided, I think, about three years in Mendham, and all our family attended the Presbyterian Church. (This church stands upon an eminence that overlooks a vast extent of country, and is perhaps the only church building in all this world that points out to us a living example, although it covers but a small space of earth), for upon either side of its roof it sheds its storm waters in every storm into two distinct and great valleys, Passaic on one side, Raritan on the other, plainly telling us that we can also distribute our good or bad examples to a vast extent of country if we wish. I propose to distribute strawberry culture on my side.

My mother being English and a little proud, bought her seat up next to the pulpit, and as we took a little after our mother in pride, we always went with her to sit in her seat where we could look over all the congregation. Father being all Dutch, bought his seat under the gallery, near the outer doors, where he could sit and smoke during service. I only mention this fact to prove that my father was really Dutch all through. Although my father smoked, he never drank any kind of intoxicating liquor, and on that side we all took after him, but as to smoking, we did not follow, and not one of us has ever smoked or used tobacco in any form.

In my next I will tell you all how I came to buy my present place and to grow strawberries, and will say here that to grow a first-class crop (what I mean by first-class is the cost of preparing your land and giving it all the fertilizers it needs for that crop) of strawberries will cost much less than any other crop that is grown; that is, wheat, rye, oats, corn, potatoes, and I will not except a hay crop, with much less labor, no lifting or lugging, digging, threshing, and carting of heavy loads through bad roads to market.

I have compared the cost; let us compare the profit. I will state truth, not fiction, as can always be proven by books or otherwise. Some years ago, Mr. E. E. Bergen, at the head of the largest commission house in Commerce street, Newark, N. J., came to me and wanted a load of strawberries to send to Boston; he waited here until it was picked, some two hours; it was all picked from a single bed of strawberries not over 30 feet wide by about 350 feet long, and I remember well he had a one-horse truck or wagon, and did not get a very large load—not over 1500 or 1600 quarts, I think.

I put all my men to picking as soon as he came and gave me the price he would pay, and he waited only about two hours for it, yet he paid me about \$300 for that load. Mr. Bergen is still living and keeping the commission house in Commerce street, and he will tell you just the amount he did pay for the single load, for I have no doubt he put it on his books at that time. I have been looking over my books, but cannot find it, as I have no recollection of the year, and as it was cash I may have never put it down. Can any farmer or fruit grower show a profit like that from a single picking from so small a space?

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. Your reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multitude of counsel there is wisdom and safety. Write us often.

**The Late E. Corning.**—I regret to hear on my arrival here that Erastus Corning, of Albany, N. Y., has passed away. His vast collection of Orchids has been the talk of European orchidists for many years. He often was found in the London auction rooms during his stay in England, buying all the novelties of merit, some of them unique, and we have seen in the collection a plant of the rare and valuable *Cypripedium Stonei* platytenium which Mr. Gray, the gardener, said was the "Simon pure," secured by Mr. Corning in England at a fabulous price. Unfortunately, the plant was small, did not respond to the careful treatment afforded it, and eventually succumbed. The *Cattleyas* and *Laelias* and *Cypripediums* were well grown, and only the very finest varieties were added. Mr. Corning's love for cool Orchids became so strong that, as you briefly noted in your issue of September 4, he despatched a collector direct to the South for a consignment, and although hundreds of plants were received and two houses filled to overflowing with grand plants, their possession did not deter him from purchasing any distinct or rare form elsewhere. The *Phalenopsis* were his especial favorites and the finest collection of varieties could be seen at his place. In fact, it is doubtful if there was a finer lot in existence; they grew with such remarkable freedom. Unfortunately, during the past year this vast collection of plants has been dispersed together with the valuable collection of Palms and Ferns.—A. DIMMOCK.

**Rooting Cuttings.**—If one has no facilities for using bottom heat, the most successful way of rooting cuttings that I have ever found is to take two flower pots, say 4 and 6 inches across the top. Stop the hole in the bottom of the smaller one with a cork and fill it with water. Put in the larger one a layer of clean sand (having first covered the hole with something that will prevent the sand running through) and place the smaller pot upon it so that the tops of the two will be on the same level. Fill the space between them with sand, and in this insert the cuttings close to the inner pot. Place them in a sunny window and keep the smaller pot always filled with water. The inner pot can be at any time lifted without disturbing the cuttings and the root growth examined.—W. H. W., Mass.

**Poison Ivy.**—I have been very much interested in articles on Poison Ivy (*Rhus toxicodendron*), published in American Gardening and other papers, and it seems to me there ought to be some way we could oblige our road masters to at least clear it from our village streets. I have not seen published my mother's remedy for the poisoning, so take the liberty of sending it to you, thinking it may prove as great a godsend to some one that is easily poisoned by the Ivy, as it has been to one of my own family. It is the broad leaf Plantain, *Plantago major*; make a strong tea of the leaves. Take two tablespoonfuls several times a day; also bathe affected parts with the tea.

One member of our family could never go near the Ivy without being affected, twice being dangerously poisoned. After we learned about using Plantain as an antidote, never was she again seriously poisoned, and also learned from experience that if she took a sponge bath of the tea and used it internally for 24 hours after she had been near or through Poison Ivy, that she would not feel any effects of poisoning at all.—M. F. JAGGER.

**Horticultural Books.**—We have facilities which enable us to supply any horticultural book published in this country or Europe. Send a stamp for our new catalogue.

## Strawberry Growing & Pedigree

To the Editor of American Gardening.

Permit me to "heartily" return my compliments of thanks to Mr. R. M. Kellogg on behalf of the many readers of AMERICAN GARDENING, including myself, who may be a little fastidious about "fake" advertising through the press in the columns of the general reading matter, for writing one article on the strawberry subject without getting in any "pedigree." Although this was the real matter in question, as may be seen by referring to my article, and though the index refers to the article as "Strawberry Plants, Pedigree," the word "pedigree" is not mentioned in it, nor is any reference made to the matter, unless it is intended that "cranky plants" should be synonymous with "pedigree" plants. In fact, Mr. Kellogg switched off onto another track, and if we will accept his definition of "crank," gave us a good article with many practical hints, which every strawberry grower should well consider.

I see that he has given us an article in the last week's AMERICAN GARDENING about how to treat asparagus for July and August cutting. It hit my case exactly, as I was looking after just such information. I am little better than a beginner in the growing of asparagus, and was working out the problem mostly by experience; and so far seem to have proven the truth of Mr. Kellogg's statements. I was very much pleased that he did not say that it would be necessary to get "pedigree" plants in order to grow asparagus most successfully. This seems to give us reason now to hope, that for the future that gentleman will give us good clean literature, free from that objectionable matter referred to above.

It may seem to some that I have expressed my opinions a little too freely in regard to this matter; but if such be the case, I have not been governed by prejudice nor by a desire to injure any one; but by an over-zealous intention to advance the cause of pomology to whose interest, most especially the berry department, I am most enthusiastically wedded.

E. W. WOOSTER, Me.

To the Editor of American Gardening.

This is a point that is jeered and made fun of by most growers. Mr. Kellogg seems to have the courage of conviction, and probably has knowledge of some facts of which others are not aware. Without a doubt "pedigree" is as important in plants as in animals. Improving strawberries is of such a recent date, and has been conducted on such chance systems that the success in securing choice (?) varieties has blinded many otherwise intelligent propagators of new kinds. The ideal berry and plant will never be produced by chance. Nature has only given us the basis, and man must work out the results by the same methods, as all improved breeds of animals or fruits have been produced. This can only be done by selection of parental predispositions. A strain of a certain variety can be wonderfully improved by judicious "selection" of the parent plants as has been well proven. But it is the same variety showing its weak points, as well as the strong in a more intensified manner. The judicious selection consists of choosing plants that show the weak points the least. Soils and management affect results to a large degree.

All permanent improvement must come through seedlings, and here is where pedigree will count. No intelligent person would breed from a scrub even if it came from the best of parents.

A certain standard must be chosen, and the berries that come the nearest to that standard will be the ones to breed from. Here is where the pistillate varieties can be used to the best advantage; it requires careful consideration and good judgment, with a knowledge of the prepotency of the different plants to be used. That we are on the high road to success is evident by the interest manifested by different writers on the subject. All that is needed is a better knowledge of the nature and habits of the plants and fruits in relation to their reproduction of the species. Then pedigree will occupy the

important position to which it is really entitled.

Since writing the foregoing, I see in your issue of September 4, Mr. Kellogg claims to be a "crank;" his definition of a "crank" is well put. It seems as if the strawberry cranks and the intensive cranks were the only ones that were making money during the hard times. Evidently, it pays to be cranky, and now another "crank" appears in the Henry berry! Keep the cranks turning, Mr. Editor, and perhaps the ideal berry will be produced before long—as well as the ideal growers of it.—HENRY SNYDER, Md.

## House Plants and Malaria. Is the Soil in the Pot a Source of Danger?

The following interesting details are taken from the report of a medical society's meeting as given in The Medical Record, the medical journals sometimes discuss even more improbable things: "Just after the Christmas holidays, Dr. Taylor was called at Sag Harbor to a woman 82 years old, who had some paroxysms of fever with gastric disturbance, and at her suggestion that it might be malaria, he examined the blood and found the malaria plasmodium. This was remarkable in view of the facts that the ground was covered deeply with snow, the patient had not been from home for four years, the well water could not have been contaminated, and all ponds were frozen. Soon a daughter had similar symptoms. There were some potted plants in the house, and he was unable to make any definite impression upon the disease until these had been removed. At the same season a third case developed in another house in which a trap-door led into a cellar whose walls were covered continuously with low forms of plant life. In still another house, some weeks later, in the same town, malaria with the plasmodium of tertiary fever developed in a child, and no apparent cause could be found except the potted plants in the room occupied by the patient. When these were removed he was able to cure the disease.

"He then went to some florists in localities where there were no marshes, and where they were not likely to be infected by the water supply, inquired into their histories, and made blood examinations. He found in four different localities that the blood of these people contained the malarial plasmodium. These florists were not ill, but they were hardly ever quite well, complaining of digestive trouble, headache, and indefinite symptoms. They could be straightened up temporarily by big doses of quinine.

"Dr. Taylor gave his personal experience when in Charleston. He took precautions about the drinking water to avoid any possible ill, and when he rode out, returned early before the mists rose from the marshes. During this time he kept well, but subsequently, not having time to ride until rather late in the evening, he contracted pernicious intermittent fever. He could then find the malarial plasmodium in his blood. A German writer had spoken of a similar fever developing in the mountainous regions of Russia, at the time of the melting of the snow. This was in harmony with what he had seen in Colorado. But at Sag Harbor the snow was not melting, and the region was not mountainous. There was no bad water to explain the malaria, and the presence of the malarial body in the blood. These facts would seem to point to something emanating from the plants, or rather from the earth itself, as one of the surest means of infection. Yet the water theory should also be borne in mind.

"Dr. R. C. Newton had little doubt that the potted plants were the cause of the malarial infection as mentioned. He could give some experience which would seem to confirm that view. He had a friend who was a florist, and while generally in good health, he had to guard against taking 'colds,' which he could cure by quinine.

"It was possible malaria might develop from plants in the room by reason of soil brought from New Jersey or Long Island."

## Roses Under Glass.

As interest in the cut flower line is beginning to pick up considerably, many will begin to get anxious about cutting their roses; at the same time the future and large demand at Christmas is something else to be calculated upon. I have always advocated early planting, that is, from the first to the middle of June, for the reason that plants planted at that date are strong enough to produce some flowers about now without injury to future crops; also by cutting early the crops will be off by the second or third week in October. To get a crop off by this time will be just about right to have one in at Christmas, providing we get anything like reasonable weather.

I don't wish to convey the impression that now is the time for all roses to flower, or that every bud that is formed should be left to develop. On the contrary, we must be very particular as to the size and strength of each individual plant, and then only let those that are in our judgment strong enough, produce a flower or two. At the same time the quantity, of stem and foliage cut with each bud should have careful consideration.

It ought to be superfluous for me to mention that none other than a good practical man should be allowed to cut, especially just now, and the same is equally true in regard to disbudding. To allow an incompetent person to perform this work, cutting indiscriminately and letting nearly all the buds develop, will most assuredly result in financial loss during midwinter.

To get along with as few flowers as possible early, and being careful not to have any surplus that will be consigned to the rubbish heap, will during the holidays repay us over and over again for our foresight and trouble.

Green fly will now be found to be more troublesome, and at the same time tobacco smoke will be more injurious. It does not necessarily have to burn the foliage or take the color out of the flowers to work injury. My experience is that at this season—when we have to be so careful with syringing, seeing to it that the foliage is well dried off before evening, especially in the case of those varieties most susceptible to black spot—if syringing is done the next morning after fumigating (which it most generally is to clean off the flies that are only partially destroyed), the foliage has a saturated appearance, even the edges of the leaves and stems being covered with little globules of water, and it is next to impossible to have them dried off by nightfall. Under such conditions we are most liable to get a virulent dose of black spot and other kindred fungous diseases, that will cause no end of trouble and loss. We should always bear in mind that roses in perfect health will not have much water adhering to them after syringing. H. H.

## Transplanting Pansies.

I have some Pansies that are just coming up. Shall I transplant them as soon as they are large enough, they are now in drills? Would you please inform me how to keep them over winter. I am a subscriber to your valuable paper, and get a lot of valuable information from it. —J. P. L., Mass.

—Yes, they need transplanting at once into prepared soil which needs to be tolerably rich and well broken up. The usual method is to use a frame of the ordinary size so that after the plants have established themselves and cold weather sets in, they can be covered with sash as occasion may require. Later these same sash need to be covered with wood shutters, straw, or other mats. Reference to this matter has been frequently made in back numbers of AMERICAN GARDENING. If needed for planting in a cool greenhouse, they can be placed in their quarters at any time now, but they need to be grown as cool as possible, and a watch for aphids must be kept. By treating them this way, they come into flower very early, and blooms can be obtained nearly all the winter.

## PRIVATE GARDENERS.

### Appointments and Doings.

*Gardeners and others knowing of recent appointments and movements are requested to forward particulars of the same for publication in this column. No charge is made.*

Charles J. Dawson until lately in charge of the greenhouses at the Bussey Institution has accepted a position in the Boston Park Department, under Mr. Pettigrew.

Jackson Dawson, of the Arnold Arboretum, Cambridge, Mass., has returned from his European trip.

### Sale of Orchids.

W. Elliott & Sons, 54 Dey street, New York, will sell by auction, Friday, September 24, at their salesrooms, the valuable collection of Orchids, the property of J. E. Brown, Esq., Bellport, L. I. Some of the more rare *Cypripediums* will be offered, also well-grown *Cattleyas* and *Dendrobiums*.

### American Institute Show.

We have been requested to give place to the following notice of amendments and rulings as regards the schedule for the forthcoming display at Madison Square Garden, New York City, September 20 to November 4:

"In the amateur classes for Dahlias, strike out the words *not less than six blooms of each*, this leaves the number of blooms unlimited.

"The word *amateur* is to be interpreted as including all persons except commercial growers."

### Red Bank, N. J.

On September 1 and 2, the Monmouth County Horticultural Society held the first regular exhibition since its organization, and a highly creditable display, filling more than two floors of the town hall, was the result. For quality and artistic effect as regards decorative plants, the honors were about even between N. Butterbach gardener to Hon. C. N. Bliss; H. A. Kittel, gardener to James Loeb, and James Dowlen, gardener to Gen. H. L. Terrell; fine specimen *Caladiums* and *Coleus* of the last-named won a well-merited award in keen competitions. Mr. Butterbach, was a large exhibitor and a number of his best specimens had been grown entirely in Jadoo, *Phrynum* variegatum thus treated was indeed superb. A rustic effect of rockery and ferns built by Mr. Butterbach was a masterpiece of taste, and a close inspection displayed many a subtle touch of an artist's hand.

Mr. Kittel had in his several exhibits decorative plants of great beauty, and his group staged in competition was remarkable also for the excellent way in which it had been put up; the most was made of the material at hand, and each plant had its individuality displayed. *Crotons*, *Palms*, and *Ferns* in variety and grandly grown were used to such advantage that to this display was awarded the extra prize of a silver cup offered by the New York Gardeners' Society for the best horticultural exhibit from a private gardener. Mr. Dowlen was second in this class with a smaller group which would have been improved by being more open. T. B. Harvey, gardener to Dr. H. E. Owen, also showed several fine *Palms*; W. Kennedy, gardener to J. Wagner, Esq., had good *Coleus*, receiving second place in a very close race with J. Dowlen; his collection included a handsome bright red *Coleus* named Monmouth Beauty.

The cut flowers were of average merit, and competition did not run close. The Lovett Co., Little Silver, N. J., made grand displays of *Cannas* and general herbaceous stock, but especially must the firm be credited for the very large lot of *Geraniums* in pots.

Fruits and vegetables formed a most interesting feature of the show and generally in the vegetable classes it was a close run for the first honors. For cucumbers Messrs. Butterbach and Dowlen divided honors; the former had English,

the latter out door fruits, each of merit. Oliver McIntosh won first for tomatoes out of five good dishes. George Standen led for onions. T. B. Harvey for string beans, green. W. Kennedy had the best carrots, and other prizes went to the aforementioned exhibitors.

The judges were Leonard Barron and A. Don of New York, and C. A. Baird of Manalapan, N. J.

### New York.

The New York Gardeners' Society held its annual dinner on Saturday last, when 68 sat down to the tables. The exhibits staged were quite numerous and varied. William Anderson, gardener to J. M. Constable, Esq., Mamaroneck, N. Y., sent a fine collection of Dahlias, among which was a beautiful fluted and fringed variety, white, tinted purple, with a purple eye; Charles Zeller's Sons, Flatbush, N. Y., had a collection of Dahlias, and also had A. Welsing, Brooklyn, N. Y. W. P. Peacock, Atco, N. J., staged in all 68, and E. Granz, Hicksville, L. I., had 50 varieties. G. B. Winslade, Mamaroneck, had a fine display of fruits, flowers, and vegetables, his tomatoes and onions being especially good. R. Angus, gardener for Major Hopkins, Tarrytown, N. Y., sent a grand piece of *Cattleya labiata*, having eleven flowers. H. A. Spavins, Mount Kisco, had a fine collection of *Cannas*, among them several promising seedlings of Paul Marquant and Flamingo, his Mrs. J. B. Dutcher being especially good. Rawson's Sunflower and *Salvia Bonfire*, together with several varieties of Dahlias, were also noticeable in this collection.

C. W. Ward, Cottage Gardens, Queens, N. Y., exhibited *Cannas*, *Geraniums*, and Dahlias.

Among the *Cannas* were noted President McKinley, an improved Charles Henderson, Souv. d'Antoine Crozy, Eldorado, yellow; Count de Bouchard, yellow-spotted; Papa, salmon-scarlet; Chicago, scarlet, and Alex Billard, crimson.

In the collection of Dahlias, *Nymphæa*, pink, white center; William Agnew, vermilion-scarlet; Arabella, sulphur-yellow, edged pink; A. D. Livona, silvery pink; Seedling No. 12, white; Snowclad, white pompon; Mrs. E. C. Monroe, yellow caste; and Henry Patrick, white, showed up well.

The best of the *Geraniums* shown were Alphonse Riccard, vermilion-scarlet; Madame Bruant, Mirande type, and Madame Jaullin, peach-pink.

John Lewis Childs, Floral Park, exhibited *Tritomas*, *Gladioli*, and fine spikes of *Lilium lancifolium rubrum*. W. A. Manda, South Orange, N. J., had a good collection of fancy-leaved *Caladiums*, and a vase each of *Cannas*, Robert Christie and Manda's Ideals, both fine scarlets.

Henry A. Dreer, Inc., Philadelphia, staged a collection of *Nymphæas*, among them O'Marana, Deaniana, Smithiana, Sturtevantii, delicatissima, Kewensis, rubra rosea, and a seedling, creamy white, of good substance.

A. Wengerter, gardener to J. B. Bliss, Esq., had a grand exhibit of vegetables, his rhubarb, King of the Garden, and Challenger beans, Daniel O'Rourke peas, and tomatoes of several varieties being beautiful specimens.

John Young, wholesale commission florist, New York, sent a vase of excellent Lily of the Valley.

R. Laurie, gardener to Cornelius Vanderbilt, Esq., Newport, R. I., sent sprays of *Acidanthera bicolor*, and flowers of a free-blooming seedling *Tritoma*, of a beautiful orange color. James Hill, Newport, exhibited a *Bromella* which excited a good deal of interest.

A. Grierson, gardener to Hicks-Arnold, Esq., staged *Gladioli*, *Physalis Franchetii*, *Clematis paniculata*, *Caryopteris mat-tacantha*, *Anemone japonica*, *Lady Ardeloun*, and *Crocus aurea imperialis*. R. Breth, gardener to J. B. Colgate, Esq., Yonkers, N. Y., was on hand with blooms of *Dipladenias*, *Bougainvillea glabra* and *Ixora Williamsii*, also fronds of *Gonophlebium appendiculatum*.

Lager & Hurrell, Summit, N. J., had an elegant piece of *Cattleya chrysotoxa*.

C. Aldred, Tydesley, England, sent a splendid collection of vegetables per S.S.

Campania, the courtesy being highly appreciated by the Gardeners' Society.

—At the regular meeting of the New York Florists' Club on Monday, September 13. Mr. C. H. Allen of Floral Park, N. Y., made a remarkable display of new Cannas. In the collection he had Italia, Austria, Burbank, Chicago, Papa, Flamingo, and a number of seedlings; among these last was an apricot colored flower which attracted attention. Two gems worthy of being ranked together were Mrs. Fairman Rogers, which is undoubtedly the best of all scarlet Cannas of the Crozy type, and Columbus. This is the first time we have seen this novelty, but certainly the first impression is good; it is in color a yellow ground, striped and laced with red. The head is compact and clean, the foliage is a rich light green, and the habit of the plant is quite dwarf.

#### Millbrook, N. Y.

The Millbrook Horticultural Society held its fourth autumn exhibition in the Memorial Hall September 8 and 9. The display of flowers, fruits, and vegetables was very good, the exhibits of the latter especially so. The Dutchess County Horticultural Society also held its regular monthly meeting here, and a paper was read by Mr. Thomas Harrison, gardener to ex-Gov. Morton, entitled "Fruits for the Family Table." This was well received and discussed.

The prize offered by the Dutchess County Society for best collection of fruits and vegetables grown by professional gardeners brought out a strong competition between four local gardeners. The exhibits of all four competitors were uniformly good, and the prizes were awarded for the larger displays rather than for any superiority in quality. The prizes were awarded as follows: First, Samuel Thorne, Esq. (gardener, I. L. Powell); second, C. F. Dietrich, Esq. (gardener, W. C. Russell); third, John Wing, Esq. (gardener, Gustav Thormen). An extra prize was also given to Oakleigh Thorne, Esq. (Charles Rapp, gardener), as his exhibit was of as high quality as the others, though smaller.

The displays made by amateurs were also very good in cut flowers and potted plants; there were also some excellent arrangements of cut flowers in vases, etc.

Mr. Miller, superintendent for John Lewis Childs, of Floral Park, N. Y., sent a splendid exhibit of named Gladioli, Dahlias, Tritomas, Lilies, etc.

#### Toronto.

The annual plant exhibit at the Toronto Industrial Exhibition both in quantity and quality was considerably ahead of last year's, nearly all the plants shown being of very good quality. The prize list was not a long one, but was fairly liberal; and, were a better building provided for the plant display, the competition would have been still keener than it was.

The anthuriums were all foliage varieties, the first and second prize lots were all good plants, first prize going to Exhibition Park. The hanging baskets were very large and showy, both entries being nearly equal as to quality, Joseph Graham being first.

In the class for stove and greenhouse flowering plants, there were five entries, and many good plants were staged in the first prize lot (Exhibition Park); there were some good anthuriums, allamandas, clerodendrons, etc. In the second prize lot (Manton Bros.) there were nice plants of Swainsona and Erica hyemalis; and among the others there were stephanotis, fuchsias, Bougainvillea glabra, B. g. Sanderiana, and some nice pans of speciosum lilies.

In fancy caladiums the most of the plants were not quite up to the usual standard. The first prize lot (William Houston), however, were very fine, and though small, were well colored and choice.

There were five entries for twelve cultivated ferns; the first two lots were good and hard to judge a handsome plant of Asplenium nidus in one lot, and a very fine davallia in the other being especially noticeable.

In the class for six adiantums the plants were hardly as good as usual. In the class for 24 ferns in 6-inch pots there were some very nice plants, all being good useful stock.

In the class for 50 ferns in 3-inch pots the exhibit was not nearly so good as usual, though some of them were very pretty little plants.

For 75 foliage plants, distinct varieties, there were four entries, all from our public institutions, and nearly all the plants shown were good and well staged.

In 12 foliage plants in pots not over 10 inches, some very pretty plants were shown, the table on which they were staged being one of the best in the building.

In coleus, there was one very good exhibit; the other two were not up to the mark.

The class for flowering begonias was poorly filled, there being but one really good plant among the lot. In rex begonias there was only one entry, but all the plants in it were very fine. The tuberous begonias, also, were not up to the usual standard, although the first prize lot, all singles, was clean and healthy.

The single and double geraniums were away below par; there was not one good specimen in the whole lot.

In the class for new and rare plants there were some new dracenas, new caladiums, some tillandsias, and a few other little things that have done duty often before.

The specimen plants in bloom trained on trellises made a fine exhibit; there were two allamandas, one Plumbago capensis, one Euphorbia splendens.

The classes for palms and cycads were all first-class, and in good variety. For the best table of plants most tastefully arranged, there were three entries, all good and arranged in different styles.

The orchids were a rather poor lot, but that is nearly always the case at this time of the year here, when there is so very little demand for choice cut flowers.

As an extra entry Sir C. Gzowski exhibited a fine plant of Cycas revoluta coming into flower; this plant has seldom been seen in bloom in Canada and caused quite a sensation among our visitors. B. Gore has had charge of the plant for about two years, and is very proud of it.

#### Riverton, N. J.

On August 31, as was briefly stated at the time the annual excursion of gardeners to Dreer's nurseries at Riverton, N. J., took place, as near as can be ascertained there were about 1,500 people present. The steamer Columbia left Chestnut street wharf, Philadelphia, at 10:20 A. M. On arrival at the nurseries the first evidence of hospitality was the presentation of a package of cigars to each man as he passed in the gates.

The first objective point was an inspection of the stock contained in the 5½ acres of greenhouses; this was a great treat to all, as everything was in such perfect condition, giving evidence of the excellent management and thorough system of Mr. J. D. Elsele, the well-known superintendent. Palms in all the popular species, and in all stages of growth, from the seed beds to the large decorative sizes, were seen by the hundreds of thousands. Ferns of every salable kind would count up in the millions, perfect in growth and hardiness, and many marveled at seeing such nice plants in such small pots. Araucarias were plunged in ashes outside under slatted roofs; too much praise cannot be given this firm for its untiring energy in trying to make this industry a home one. A few years ago propagation of these plants was attempted, now several thousands are rooted annually.

Now, the crowd is surging towards the Canna field which was one mass of bloom. There are in all 200 varieties to be seen here; the older and standard varieties for stock, as well as all the new varieties possible to be obtained for trial purposes; among these latter one of the most noticeable was Allemanina, a large flower on the Italian order, of an almost indescribable color, the nearest description being a madder-brown, deeply bor-

dered by a clear lemon-yellow. Near to this was a grand variety, Depute Ravarin, a beautiful deep reflex garnet, of extreme richness, with a very erect spike; this is undeniably one of the best of the 1897 Crozy set. Another one, Pres. Max Michell, was noticeable for its bright flowers and semi-bronze foliage; La France, a bronze-leaved variety, an excellent thing for effective planting. Pandora, another on the Italia style, a grand flower on the terra-cotta order. Another useful variety was marked No. 38, a dwarf grower, bronze foliage with bright red flowers. Aurore, orange-salmon, very distinct, with large flowers, will undoubtedly prove a useful one. Besides these, all the new French and Italian varieties were seen, but they are too numerous to mention.

The next chief point of interest was the water garden, under the charge of William Tricker; this was very interesting. A large basin containing the tender Nymphaeas was much admired. The ponds of the hardy sorts contained many recent introductions. The Nelumbiums in the background made a complete picture.

Passing on to the trial grounds, some spikes of white flowers were seen in the distance; these proved to be the new Gladiolus, White Lady, pure white, a perfect flower with an excellent spike of superior form; the gardeners were all deeply interested in the extensive trials of vegetables and flowers.

In the packing sheds, tables had been erected on which were displayed all the principal varieties of Cannas, Dahlias, Petunias, etc., and a remarkably interesting display of tomatoes on dishes, thus affording easy comparison.

#### Newark, N. J.

The New Jersey State Fair held at Waverly Park during the first week of the month was a great success; the agricultural and horticultural department was never better patronized than upon this occasion. The entries were unusually numerous and the exhibits in fruit and vegetables of a high order of excellence. Such a display of pears as was seen there rarely falls to the lot of any one at state fairs. The total number of entries in the department was 3,000, being 700 in excess of last season, and the space allotted was entirely inadequate, consequently apples and vegetables were actually staged in heaps!

Grapes, pears, and peaches alone made 1,600 entries, and considering the season, the display of grapes was a surprise to all. The champion prize for 50 kinds was carried off by C. C. Corby, Montclair, with Mr. Copley, Staten Island, second. For 25 kinds, Henry Jerolaman was first. This last-named exhibitor was also most successful in the single plates. For 50 plates of pears in that number of varieties, Ellwanger & Barry, Rochester, N. Y., was first; while for 25 plates the competition lay between that firm and Henry Jerolaman, the latter being victorious with a handsome lot of large, even-sized, highly-colored, perfect fruit.

The floral section was chiefly represented by florists or trade growers, who turned out this season in greater numbers than usual. Henry Decker, East Orange, was the principal prize-taker in plants. The Elizabeth Nursery Company secured the first prize for a group of hardy shrubs and conifers.

#### Deafness Cannot be Cured

by local applications, as they cannot reach the diseased portion of the ear. There is only one way to cure Deafness, and that is by constitutional remedies. Deafness is caused by an inflamed condition of the mucous lining of the Eustachian Tube. When this tube gets inflamed you have a rumbling sound or imperfect hearing, and when it is entirely closed Deafness is the result, and unless the inflammation can be taken out and this tube restored to its normal condition, hearing will be destroyed forever; nine cases out of ten are caused by catarrh, which is nothing but an inflamed condition of the mucous surfaces.

We will give One Hundred Dollars for any case of Deafness (caused by catarrh) that cannot be cured by Hall's Catarrh Cure. Send for circulars, free.

F. J. CHENEY & CO., Toledo, O.

Sold by Druggists, 75c.

## WHOLESALE MARKETS.

### New York.

The cut flower market is so much overstocked that the demand is only equal to about one-quarter of the supply; this, together with the hot spell, makes the entire business of but little value to growers or dealers.

Fruits and vegetables are but slightly better fixed than flowers, the market is very much overloaded and entirely at the mercy of pedlars and preservers; consequently prices are uncertain and low.

Pears are in very large supply and demand the most attention of dealers. The great bulk of Bartlett's are poor in quality and realize only 75c. to \$1.75 per barrel; large clean good-colored fruits are worth \$2.50 to \$3, but only few of such quality are even seen. Seckle is abundant and makes from \$2 to \$3; Beurré Clairgeau and Beurré d'Anjon rarely exceed \$1 to \$1.25 per barrel.

Apples—Duchess of Oldenburg, hand-picked, d.-h. barrel, \$2@2.50; Gravenstein, hand-picked, per d.-h. barrel, \$1.75@2.50; Holland Pippin, hand-picked, d.-h. barrel, \$1.50@2.25; Fall Pippin, hand-picked, per d.-h. barrel, \$1.50@2.25; Twenty-ounce, hand-picked, per d.-h. barrel, \$1.75@2.25; Codling, hand-picked, per d.-h. barrel, \$2@2.25; Blush, hand-picked, per d.-h. barrel, \$1.75@2.50; mixed varieties, fair to good, per barrel, \$1.25@1.50; poor to fair, per barrel, 75c.@\$1.25; Missouri mixed varieties, ordinary, 75c.@\$1.25; Virginia, fall varieties, per barrel, \$1.25@2.25; Crab apples, small, choice, per barrel, \$2@3; large, per barrel, \$1.25@1.75.

Peaches—Maryland and Delaware, per carrier, 75c.@1.50; extra, per basket, 60@75c.; prime to choice, per basket, 40@55c.; common to fair per basket, 15@30c.; Pennsylvania and western Maryland, 20-pound handle basket, 25@50c.; Jersey, extra, selected, per basket, 60@65c.; selected, choice, per basket, 40@50c.; fair to good, per basket, 25@35c.; culls, per basket, 15@20c.; up-river, per carrier, 35c.@\$1.

Pears—Bartlett, large, clean, per barrel, \$2@2.50; poor to fair, per barrel, 50c.@\$1.50; Seckle, prime, per barrel, \$2@2.75; later sorts, fair to good, per barrel, \$1@1.50; common kinds, per barrel, 50c.@\$1.

Grapes—Delaware, up-river, per 24-pound case, 50@75c.; Niagara, up-river, per 24-pound case, 50@75c.; Moores' Early, up-river, 24-pound case, 35@45c.; Wordens, up-river, 24-pound case, 35@45c.; Concord, up-river, per 24-pound case, 35@45c.; black varieties, up-river, per 8-pound basket, 9@11c.; Jersey, per 8-pound basket, 9@11c.; black varieties, Jersey, per 5-pound basket, 5@6c.

Plums—Quackenbos, state, per 8 to 10-pound basket, 20@25c.; purple egg, state, per 8 to 10-pound basket, 15@20; Gage and Reine Claude, state, 8 to 10-pound basket, 20@25c.; common green, state, 8 to 10-pound basket, 12@16c.; common blue, state, 8 to 10-pound basket, 12@16c.; Damson, per 8 to 10-pound basket, 20@25c.; per quart, 2@3c.; per barrel, \$2@2.50; up-river, one-half bushel crates, 50@60c.; per barrel, \$1.50@2.50.

Watermelons—Nanticoke, extra large, per 100, \$15@22; Jersey, large and fine, per 100, \$10@15; Virginia, large, per 100, \$10@12; small to medium, per 100, \$5@8.

Muskmelons—Hackensack, nutmeg, per barrel, \$1@1.50; Monmouth County, Nutmeg, per barrel, 75c.@\$1.25; Jenny Lind, per barrel, 75c.@\$1.75; south Jersey, Gem, and J. Lind, ordinary, 50c.@\$1; Maryland and Delaware, per bushel basket, 30@60c.; per one-half barrel basket, 75c.@\$1.75; Colorado, per 70-pound crate, \$2.50@3.

Beets—Local, per 100 bunches, \$1.

Cauliflowers—Per barrel, \$1@3.

Celery—Choice large, per dozen, 25@30c.; fair to prime, per dozen, 12@20c.; small and poor, per dozen, 5@10c.

Corn—Hackensack, per 100, 75c.@\$1.25; other Jersey, per 100, 50c.@\$1.

Cabbages—Jersey and Long Island, per 100, \$2@3.

Cucumbers—Jersey and Long Island,

## HENS AND EGGS

Undoubtedly there are many readers of AMERICAN GARDENING who keep hens who do not take a poultry paper; possibly some take the wrong one. Gardening,

fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of POULTRY MONTHLY, to offer that journal in club with AMERICAN GARDENING, for the coming subscription season, both journals postpaid, one year, for the SMALL SUM OF \$1.25.

POULTRY MONTHLY is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of AMERICAN GARDENING recommend Poultry Monthly as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

### A WONDERFUL OFFER!

American Gardening (Weekly), \$1.00 } Both \$1.25  
Poultry Monthly, - - 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.

Address AMERICAN GARDENING, P. O. Box 1697, New York City.

Turnips—White, per 100 bunches, \$1@2; Rutabaga, per barrel, 75@90c.

The potato market for high-grade stock is firm and seems likely to remain so. Long Island in bulk, per barrel, \$2@2.37; Jersey, per bag, bag included, \$1.75@1.90; choice, round, in bulk, per barrel, \$1.87@2.12; average prime, in bulk per barrel, \$1.62@1.75; poor to fair, in bulk, per barrel, \$1.25@1.50; Albany and Troy in bulk \$1.50@2.

### Philadelphia.

This market has recovered somewhat from the declining tendency noted last week, and stock has therefore cleaned up better, although prices do not advance to any extent. The peach market has been very good, being well cleaned up every day and the quality continues improved over that of the past three or four weeks.

Apples—Oldenburg, hand-picked, per barrel, \$2@2.20; Gravenstein, hand-picked, per barrel, \$1.75@2.25; Holland Pippin, per barrel, \$1.50@2; Maiden's Blush, per barrel, \$1.50@1.75.

Pears—Bartlett, choice, per barrel, \$2.25@3; fair to good, per barrel, \$1.50@2; late varieties per barrel, \$1.25@1.75.

Peaches—Pennsylvania, Cumberland district, per carrier, \$1.50@2; per handle-basket, 30@50c.; regular basket, 50@80c.; fair to good, 30@40c.; Maryland, per carrier, \$1.25@1.50.

Plums—Damon, per quart, 2@4c.; table varieties, 10-pound baskets, 15@20c.; Gage, 10-pound basket, 15@20c.

Watermelons—Choice, per 100, \$15@20; Jersey choice, per 100, \$10@12.

Muskmelons—Jenny Lind, per barrel, 75c.@\$1.25; south Jersey, Gem, per barrel, 60c.@\$1; Maryland, one-half bbl. basket, 60@80c.

Celery—Choice, per dozen, 35@50c.; fair to good, 25@30c.

Corn—Jersey, 50@80c.; Pennsylvania choice, per 100, 75c.@\$1.

Cabbages—Jersey, per 100, \$2@3.50.

Cucumbers—Jersey, per basket, 25@35c.; per barrel, 75c.@\$1.25; pickling, per 100, \$1@1.50.

Egg plants—Jersey, per barrel, 75c.

Lima beans—Per 100 pounds, \$2.50@2.75.

Green peas—Per bushel, 50@80c.

Onions—Jersey, white, per barrel, \$2@3; New York state, yellow, per barrel, \$1.75@2; Pennsylvania, yellow, per barrel, \$1.80@2.

Peppers—Jersey, per barrel, 50@70c.; per basket, 20@30c.

Squash—Hubbard, per barrel, \$1@1.50.

Tomatoes—Choice, per basket, 40@60c.; fair to good, 25@30c.

A slight decline was noticed in potatoes; Jersey, per barrel, \$1.75@2; per bushel, 50@60c.; sweets, per basket, 25@30c.

### Boston.

Apples are in a situation different from that of a week ago; good hard apples are in demand at around \$2; if they are all red or two-thirds red colored and can be called "fancy eating," they bring \$2.50@3 in a limited way, and for our readers' information, good hard apples in large barrels could be quoted as a wide range from \$2@3, according to their color and fitness for the table or kitchen.

Watermelons have changed their position; large-sized melons are in quick sale, those counting 40 and 50 to the wagon, bringing 30c. in large quantities; those counting 70 to the same wagon, 25c., while those counting 90 to the wagon bring about 20c.

Those Rocky Ford Nutmeg melons from Colorado gathered the dealers all in; they were put out at \$2 in crates, holding about half a barrel; another car coming this week, and will be placed at 25c. or 50c. higher figures. Their flavor is exquisite and every melon can be eaten.

Rhode Island Emerald Gem bringing \$2@2.25 a barrel, with other varieties ranging downward to the muskmelon at 75c.; the Osage and so-called Black Jap oftentimes vie with the Emerald Gem at the top prices.

Green corn is eaten by almost everybody at prices ranging 10@15c. per dozen.

Choice tomatoes are in as good demand, 50@75c. a bushel; medium stock not wanted at present.

Native egg plants coming, sales slow; warm weather was little too hot for peppers even at \$1 per barrel.

Celery takes a range of 50c.@\$1 per dozen, price depending largely upon whom the buyer may be. Those wanting

it pay \$1; those who don't care whether they have it or not pay 50c.

Marrow squash little easier, \$1@1.25 a barrel.

Onions are firmer, if in large barrels, \$2.25; if in small Ohio barrels, \$1.75.

Cucumbers three-quarters of a cent each; if small-sized suitable for pickling, \$1@3 a bushel; the small assorted, about two inches in length, bringing the higher figure.

String beans, fancy, small, used for pickling, \$1 a bushel; horticultural shell beans, \$1.50 a bushel; Selva beans \$2.50 a bushel; lima \$1.50@2.

Mint, 45c. a dozen bunches.

Cabbage having a good sale 3@5c. a head; cauliflower, light demand; carrots 75c.@\$1.25 a bushel; beets, 50c.; turnips, also at 50c.

Potatoes very firm at the railroad yards selling 75@90c. a bushel; if offered in barrels, \$2.75.

Sweet potatoes little easier, \$1.62; consumption very large.

Pears are unchanged, very hard to find our choice Bartletts; New York stock bringing \$1.50@2 a barrel, while some assorted home-grown would bring 75c.@\$1 a bushel; readers can estimate what other varieties would sell at.

New Jersey sending peaches freely; Maryland and Pennsylvania letting up; Connecticut steady; New York just breaking out. Best yellow stock from Connecticut bringing \$1.25 in five-eighths baskets; readers, however, must understand it was assorted stock; home-grown bringing 50c.@\$1 for fancy white or yellow; New York state in 12-quart basket, about 50c. Michigan in the 6-basket carriers about \$1; while the Blue Mountain stock in same package \$1.50@1.75.

Grapes, Pony Delawares, 15@18c. a basket; Worden's, Moore's Early, or Concord, 8@9c. Small baskets are the kind everybody wants this year.

Not so many plums coming, but there is a very limited sale; fancy blue stock might be quoted 20@25c., with no demand whatever for green.

Modern methods of packing and shipping tender fruit have made it possible to send it long distances without injury. Refrigerator cars, built exclusively for fruit, are used for what is to be shipped a long distance. These cars are iced twenty-four hours before being loaded and then run as close as possible to the orchard. The fruit is frequently carried by the pickers directly from the tree to the cars. The cars are iced then every twenty-four hours until the fruit is delivered at its destination.

Our publishers will supply any book wanted. Send your orders.

NOW READY.

# The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

## ALL ABOUT THE HOME PLOT

## POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Crimson Clover for Poultry.

One of the best plants for poultry pasture is Crimson clover. It contains even more of the precious nitrogen than the common Red clover. It is a cool-weather plant, and grows right along through the winter whenever the ground is not frozen. It should be sown as soon as possible, among any kind of garden truck, where potatoes or other crops have been harvested; and the seed can be lightly raked in. A pound of seed, costing 10 cents, will sow a patch large enough to furnish dollars' worth of green pasture, to which the hens will gladly help themselves, if permitted. We scatter a little turnip seed with it, sowing where the potatoes have been dug. Effort is being made to throw this crop into disrepute, through the claim that it is sometimes dangerous to stock; but the trouble, if genuine, belongs only to the blooming and seeding time, which the hens will not allow it to reach.

## Second Crop Cabbage.

As the heads are cut from the cabbages in the kitchen garden, the large leaves remaining should be broken off, and fed to the fowls. They furnish an excellent article of food, which assists greatly in egg production. Upon the stumps which have been left, new shoots will start, and, in a few weeks, a new crop of green food will be ready on the same old stumps and with no additional labor. The stumps may then be pulled and given to the hens, a waste crop thus being made to save the somewhat expensive headed cabbage.

## New Color Combinations in Geraniums.

Why, with the constant improvement in size and variations in color combinations in the favorite old plant—why need we—why do we see the same old sorts constantly in use? Some of the newer sorts are most admirable in form, immense in size, and incredibly full as to truss. "Old friends are best," says one. True, but trite; and fatal to advancement if all held to it absolutely. Keep the best of the old, indeed, but look back to the time when they, also, were novelties, and let them plead for, rather than against the new. Suppose we had all denied that beautiful novelty, Souv. de Mirande, a chance to prove her worth? Don't we want to try the new pink, white-centered, red-veined sort? That's Baron Scalibert. Do we want (some people don't) a kind with enormous trusses of extra large flowers in a new shade of rosy magenta? That's Pres. Victor Dubois. Do we want another "Miranda," but with scarlet in place of the carmine edge? That's Columbia. Do we want a combination of rose and heliotrope? That's Violet Queen.

## Potting Garden Bulbs.

It can be done, and with satisfaction, but not in all cases. If the bulbs were growing in the garden beds for many years past, and have become crowded, the chances are that only a small proportion, even of those which have sufficient size, can be depended on for bloom. It is impossible, too, to tell just which ones these are. If the bulbs are taken up each year, as is the custom of some, the larger ones may be devoted to the pots with good prospect of success. If not moved for years, they may be taken up now, set as per directions for newly-bought stock, and grow one year, when they will furnish fair selected potting bulbs. If the smaller ones are not needed, some neighbor will be glad to grow them on to blooming size.

## In the Sunniest Window.

Let those who would succeed with plants for winter bloom, study closely to adapt the plant to the situation. The yellow Oxalis, the Linums, Carnations, Roses, highly-colored "foliage" plants of nearly every sort, and the potted Lilies will not be satisfied with less than fullest measure of sunshine when the sunny

hours are at their shortest. Turning the pots daily is a good specific for the health of the roots, and this means for the health of the tops, the part which we, short-sightedly, call the plant.

## The Unaccommodating North Window.

Thus we often term it, mentally, if not aloud, the while we almost envy our neighbor with the gloriously sunny south window, and even her with the "general-purpose" west or east exposure. But care in selection may give us a delightful bower, even on the cold, north side, lying in sunless dullness and lack of color. Bloom and color may be had through the use of the Begonias. The Asparagus, scented Geraniums, Lycopodiums, Ferns and some of the climbers may be leaved on for greenery. But all the more in a north window, let the care-taker beware of crowding the occupants. With the gift of sunshine denied, let no plant suffer also for lack of light. If we ask beauty, let us not be so unreasonable as to deny the essential conditions.

## Yellow, and Sunshine.

We sometimes call yellow blooms "transmuted sunshine," possibly because the term is a sort of shibboleth which has come to be familiar to our tongues. But, looking closely at yellow in plant or flower, shall we not find an intimate relation between this color and the sun-god? What plant can you recall, yellow in foliage or flower, which does not seem, to an extreme degree, dependent on the sun for its greatest beauty?

## The Hybrid Teas.

When the French rosarian triumphantly named his masterpiece "La France," more than a score of years ago, it would have been very difficult, if not impossible, to imagine the glories of the new class which it introduced. The teas are, it would seem, unapproachable; the magnificent hybrid perpetuals meet the wants and satisfy the tastes of some even better. But what can one say that shall seem enough praise for the hybrid teas, which unite in one all that is best in the two older classes? Among the newest sorts, Souv. de Pres. Carnot may easily be placed first in popularity, both because it is a delightful Rose, and because it has had plenty of advertising. Lacking this last, Mdme. Abel Chatenay, Souv. de Mdme. Eugene Verdier, Augustine Haleme, and many another will have to prove its own worth by its behavior. Here and there an extra superb sort will enter the forcing class, but the greatest value of these new hybrids should eventually show itself in the outdoor rosery.

## Variation in Styles of Roses.

It is especially the aim of raisers of flowers of sufficient beauty and variety to be worthy of shows of their own, to increase the variety as far as it may be done within the lines of beauty, and often to mere oddity. In Roses, the variation is far wider at the present time than most people could believe. It is the outdoor grown that show it most. The flat and the cup-shaped; the globular, the lacinated, and those with a broad frill of petals filled with shorter, finer ones in Hollyhock style; those with Tulip colorings, the selfs, and the striped make together, a very interesting display.

## Fighting Insect Foes.

If the poultry house is so built that it can be tightly closed, probably there is no better way of ridding it of pests, than to fumigate, either with sulphur, or with some similar preparation. It is by no means so much trouble as people seem to believe it. There seems to be a very hazy lot of ideas as to where vermin breed. One wiseacre gives, in a poultry paper, minute directions for placing the roosts so as to be free from contact with the sides of the house, on legs which are to be set in cans of kerosene. The idea is not bad, nor is it new; but its supposed author affirms that, by its putting into use all blood-sucking vermin can be defied. Is it possible that he believes that all such pests come from without the roosts, that is, from other portions of the houses?

MYRA V. NORRIS.

**OUR NURSERY STOCK**  
is grown on the banks of the Hudson River. It is First-class. Prices are Low. 50 acres of **FRUIT TREES**, Plants, Vines and Ornamental Stock to sell. 1897 Catalogue free.  
**T. J. DWYER**, Cornwall, N. Y.

Mention American Gardening when you write.

**CIVIL SERVICE EXAMINATION**  
Called by county commissioners. Topic: "Fencing." With nine competitors Page agent walks off with contract because of superior points of excellence named. Write for proof.  
**PAGE WOVEN WIRE FENCE CO.**, Adrian, Mich.

Mention American Gardening when you write.

## Business Cards.

**C. D. Zimmerman**, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished.

**LAND DEVELOPMENT**, consultations, plan, superintendence, plants, labor, etc., supplied in work as wanted. 500 original designs for residential gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. **Joan Forsyth Johnson**, P. O. Box 100, New York City.

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at **TWO CENTS PER WORD** each insertion, payable in advance. The address will be charged as part of the ad., and each initial, or a number, counts as one word. No cuts or display type allowed.

**RASPBERRY** and Strawberry plants. **Chas. C. Nash**, Three Rivers, Michigan.

**L. C. BOBBINK**, Rutherford, N. J.—Dutch Bala Clematis, Magnolia, Rhododendron, Anemone, etc. Branch of the Horticultural Company, Rijkkoop, Holland.

**DIRECT** from the grower, duty free. **Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue** is now out, prices very reasonable, anybody who has not received a copy should address **Hulsebosch Bros.**, Englewood, N. J.

**LILY OF THE VALLEY PIPS**.—The undersigned are open to undertake the purchase of Lily of the Valley Pips for a first-class firm and can supply the very best qualities by reason of their intimate connections with the most renowned cultivators of the "Mark" District. **Schulze & Fiedl**, Seed Merchants, Rathenow (Brandenburg).

**CALIFORNIA** Privet make the finest ornamental hedge, and are perfectly hardy. Fine lawn plants grown at seashore, two years old, \$1 per hundred. Cash with order. References, First National Bank, Asbury Park, N. J., State Bank, Newark, N. J., Atlantic Coast Nursery, James H. Cornell, Proprietor. Office, 605 4th Ave., Asbury Park, N. J.

## Situations Wanted.

Advertisements will be inserted under this heading at **ONE CENT PER WORD** each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

**WANTED** a place; I can with confidence recommend my gardener to any lady or gentleman in want of such: he is in all trustworthy and a good gardener who knows his business. **J. K. Larns**, Box 98, Marion, Mass.

**POSITION** wanted as gardener, by a German-American, 31 years of age, single, with a life-long experience in Germany and America; in business himself for 5 years, and for past two seasons had gardener for the leading hotel in central New York; understands the construction of greenhouses and landscape gardening; vegetables and mushrooms specialties; would like to work for christian people; best of references. Address **Chas. Malone**, Box 5, Oswego Falls, N. Y.

When ordering goods subscribers will confer a favor on the publishers by stating they saw the advertisement in **AMERICAN GARDENING**. We admit only responsible business houses in our advertising columns. Avoid delay and disappointment by giving name and address legibly.

# READ THIS FIRST

The publication of the below article in a recent issue of **AMERICAN GARDENING**, has brought Mr. Jerolaman hundreds of letters from every part of the country.

## Strawberries Henry and Mary.

We have grown almost all varieties of berries, but have only found two really large fruited ones. The one is Mary, originated by the late H. Alley of this village, the other is called, here on Boyden Farm, Henry. We grow tens of thousands of quarts from each variety every year, and they are without doubt the largest and best of all grown in the whole world. I have had this season thousands of quarts of Mary, where from five to ten berries would make a heaping wooden quart, and I have preserved several in glass jars, with formalin, so that all who doubt can come here and see for themselves. Some of these berries in the jars measure thirteen inches around. I am the present owner of the Seth Boyden farm. Seth Boyden originated the first large strawberries, perhaps, in the world (Agriculturist and others); he died in 1870. I then bought his farm, and have continued to grow strawberries from that time to this, and will say that I am positive the plant called Henry is, beyond all doubt, not only the strongest plant, but the largest, best, hardiest, and sweetest strawberry ever yet produced; color dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. I have grown it for the past four years for market in a small way, and this season nearly one-half of all that I grew was Henry; it will out-produce any strawberry plant that I have ever known, four-year-old plants giving very large, and just as fine berries as plants one year old. The plants as yet have shown no disease, while all other varieties, such as Great American, Jersey Queen, and nearly all varieties except those soft berries not good for market (Sharpless, Bubach, and others), have shown disease in the plant. The Mary this season could not stand the hot sun, and nearly one-half of all the plants burnt and dried up while full of berries. Mary will not bear the second season, but must be set every year, while of Henry, not a single plant has died, either old or young; it is the first berry ripe and the last. I am picking large berries from the Henry to-day, July 15.—HENRY JEROLAMAN, N. J.

Mr. Jerolaman will not answer any further correspondence except through the columns of **AMERICAN GARDENING**.

# YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

**T**HROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of **AMERICAN GARDENING** have become possessed of the story of the life and cultural methods of **Henry Jerolaman**, undoubtedly the **STRAWBERRY KING OF THE UNITED STATES**. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of **AMERICAN GARDENING**. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us **One hundred thousand plants of the HENRY STRAWBERRY**, to be used solely as premiums to subscribers to **AMERICAN GARDENING**. The Henry Strawberry has positively never before been advertised.

## THE CONTRACT

*Publishers American Gardening.*

*Gentlemen,*

*I hereby agree to furnish you within the next twelve months in quantities as ordered. One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold.*

*Witness*

*Thos. S. Anthony.*

*(Signed)*

*Henry Jerolaman*

## The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of **AMERICAN GARDENING** has brought him hundreds of inquiries from the cream of the professional growers.

## A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one strawberry grower in every town, village, and hamlet can come into a good thing through practising the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

## Taking Advantage of Our Offer:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid.

**FIVE PLANTS** ..Of the.. **HENRY STRAWBERRY**  
Unequaled

And **AMERICAN GARDENING** One Year.

Present Subscribers are entitled to this Offer on renewal; if their subscription has not expired, it will be dated ahead.

Plants to be shipped this Fall or in the Spring, as you prefer.

## OFFER EXTRAORDINARY

For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, **Five Plants of HENRY STRAWBERRY**; at the same time we will also send **Five Plants** to the party subscribing through you. Thus a club of 10 new subscribers entitles you to 50 plants of this wonderful Strawberry, as well as each individual subscriber to 5 Plants. This is a **BIG OFFER** to all who want to become larger holders of this wonderful Berry, never before advertised. **Time is short, get to work to-day.**

Address **Publishers AMERICAN GARDENING, P. O. Box 1897, New York.**

# Trial Subscriptions

For \$1.00 we will send **AMERICAN GARDENING** on three months' trial (13 weeks) to four separate addresses, and as a premium, **Five Henry Strawberry Plants** to the one getting up the club. **HUSTLE.**

# THE HENRY

## The Most Wonderful Strawberry of the Age.

**M**ESSRS. STEVENS, SIMPSON & CO., Commission Merchants, 232 West Street, New York City, state they handle the HENRY Strawberry, and have realized for it the highest price obtainable for any outdoor stock coming into New York market. Mr. Simpson further states that, in his opinion, as grown, packed and shipped by Mr. Henry Jerolaman, it is the BEST HOME MARKET BERRY in existence. For SIZE, COLOR, and SWEETNESS, and, in its KEEPING QUALITIES, IT HAS NO EQUAL; these many points in its favor rendering it easy for the grower to realize considerably more per quart than the regular market value of Strawberries generally.

**M**R. JEROLAMAN says, and his statement is corroborated by those who have seen the fruit: The HENRY is beyond all doubt not only the strongest plant, but the largest, best, hardiest and sweetest Strawberry ever yet produced; color, dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. . . . It will out-produce any Strawberry plants that I have ever known, four-year old plants giving very large and just as fine berries as plants one year old. . . . The plants as yet have shown no disease. . . . It is the first berry ripe and the last.

## New Types of the Persian Cyclamen.

Within the last few years there have been recorded in the European horticultural journals several instances of striking variation or modification in the flowers of the Persian Cyclamen. How it should come about that this plant should at this particular period manifest such restlessness is a matter of both curiosity and interest. It is probable that some disturbance in nutrition at some particular stage of growth may be held accountable; but even accepting that as an explanation of the appearance we are as far off from an understanding of the cause as we were at the beginning.

The Persian Cyclamen was first introduced into Europe in 1734 when a plant was offered at Lille, France, and was purchased by the Belgian monk Reyntkens for 65 francs, and it is from that one plant that have sprung all the host of varieties now offered by the seed and florist trade, for there is no record of hybridization with the Persian Cyclamen.

This capacity of a species to vary is not peculiar to the Cyclamen, other plants, especially the Chinese Primrose, having an equally marked tendency to variation, but this range of variation of a single species is a matter of great interest, and when such distinct types as the one shown in fig. 186 can be raised true from seed and in various colors, one's ideas of the limits of a species become confused, and the old question of "what is a species" crops up afresh.

The fringed Cyclamen which is offered for sale under the suggestive title of Papilio or Butterfly is perhaps the most beautiful

of the types now shown and it is curious to note that it has appeared spontaneously in two different places. This tendency for a variation to show itself at about the same time in widely separated places is another interesting biological problem that is often presented to the horticulturist.

The created form of flowers shown in fig. 187 is of English origin and has also appeared in France, reproducing itself true from seed.

A Belgian florist is the raiser of the double-flowered types represented in fig. 188, and it is claimed the flowers are produced freely. This form has passed into the hands of a leading seed house, so there is a likelihood of its being offered to the public within a short time.

In a recently-issued number of the Journal de la Société Nationale d'Horticulture de France we find a very interesting and useful paper on cultivation and mode of growth of the Cyclamen, by MM. Alex. Hébert and Georges Truffaut, from which we extract the following:

In its natural habitat the Cyclamen of Persia is met with in temperate regions, in mountainous and dry situations. Plants grow by preference in sandy-loams that contain a certain amount of humus, but they can not thrive if stagnant water exists in their vicinity. Normally, their blossoming takes

FIG. 186.—NEW TYPES OF CYCLAMEN—FRINGED.

place in the spring, and usually it occupies three years to mature the plants, but by improved methods of culture, the Cyclamen is made to produce its flowers in one year, which is of great advantage from a commercial point of view. But the authors say this rapid method of obtaining fine plants is no easy matter, as they are very capricious in their habits. In

order to learn something of the food requirements of the Cyclamen, and the best methods of developing the genus, the authors submitted sixteen plants of *C. pericum* (pure white) to chemical analysis. They had been grown in a cold-frame in a mixture of leaf-mould and sandy-loam, and had been watered during the period of active growth with a weak solution of cow-dung manure.

The following are the results:

WEIGHT OF PLANTS, DIFFERENT ORGANS, IN GRAINS.

In Fresh State. In Dry State.	
Flowers.....	7.06.....0.75
Leaves.....	22.68.....2.25
Stalks.....	89.62.....8.00
Tubers.....	28.06.....2.62
Whole plants.....	92.42.....8.62

COMPOSITION OF THE MIXED ASHES OF THE CYCLAMEN.

	Per cent.
Silica.....	17.20
Chlorine.....	7.98
Sulphuric acid.....	7.15
Phosphoric acid.....	0.22
Oxide of iron and alumina.....	10.60
Lime.....	4.86
Magnesia.....	8.82
Potash.....	28.80
Soda.....	12.82

These figures show that the Cyclamen in regard to its chemical composition approaches very near to the terrestrial Orchids. It contains a considerable proportion of water, more than 90 per cent., and relatively to other plants but little ash or mineral matter, and not much of the element nitrogen. The analysis of the ash shows that it is particularly poor in phosphoric acid, but rich in potash, and somewhat less rich in soda. They appear to be the poorest in phosphoric acid of any plants yet examined except Ferns, and very low in lime and magnesia.

From the data thus given it appears that the Cyclamen is not very exhausting in its effects upon the soil for either nitrogen or mineral ingredients.

The cause of failure in Cyclamen culture is put down by the authors to unsuitable soils, and that there is a danger in the composts used being too rich, which would favor a too rapid formation of vegetable tissues, and hence lead to leaf-growth instead of blooms.

The question of watering the authors consider as very important, chalky waters being thought to be particularly harmful.

The general conclusions are that: 1. Under the influence of forcing manures the Cyclamen increases in total weight of plant, but the foliage is encouraged at the expense of bloom production.

2. Successful culture can only be attained by a suitable selection of soil, which should be leaf-mould with a mixture of sandy loam.

3. Should the plants look sickly, they will be benefited by being watered near the roots with a liquid manure containing a quarter of an ounce each of nitrate of soda and iron sulphate to two gallons of water.

Our figures 187 and 188 are respectively from the *Gardeners' Chronicle* and *La Semaine Horticole*.

The peach growers' greatest enemy is not the yellows, nor the borer, nor rot, nor frost, nor fungus, nor even the commission man, said a speaker before the Ohio State Society. It is the cull peach, which saps the vitality of the tree, breaks down the market and generally breaks up the grower. Cull fruit of all kinds should not only be thinned for the tree's sake, but also for the sake of the market. When a consumer buys a basket or a bushel or two of culls of any kind, his appetite for that kind of fruit is usually satisfied for the season.

Potatoes are high-priced this year, partly because after the low figures realized in '96, many farmers grew something else. The reverse also holds good and because a crop realizes well this year the wide-awake grower will likely leave others to tumble over one another to sell next season.

## The Pansy as a Bedding Plant.

In order to get strong and healthy pansy plants suitable for bedding, I have found that one must aim to produce medium-sized stocky plants; small ones do not make a display at once, and large ones are not easily moved, and certainly do not give satisfaction when shipped a distance. We grow here from 20,000 to 30,000 plants for ornamentation of our station grounds between Philadelphia and Pittsburgh and on some branches as well. We have consequently various climatic conditions and a goodly variety of soil to contend with.

### Sowing.

The idea is to have something pretty early in the season. While the pansy is quite hardy nothing is gained by planting your beds before the wintry frosts are gone; if the ground is likely to freeze to a crust during night, the pansies had better be in the frames until such danger is over. We have found it safe to plant in mild localities by April 1, but in our mountain regions not before April 15.

By planting time one should have good strong plants just filled with their first flowers or buds, and to get this result, the seed is sown between August 15 and September 15 in a couple of batches; this gives one a succession, which is a convenience when ready to transplant them; the seedlings can then be handled in rotation before they overgrow and get too long and thin; it is with pansies as with chrysanthemums, when they are not transplanted when ready, they lose in vitality.

Never sow the seed too thick, no matter whether in drills or broadcast, good stout plants which have had enough room to develop have more roots and are easier and quicker handled.

I have found it most practicable to sow in drills four inches apart; one can more readily weed the frame when necessary.

### Transplanting.

By November the plants will be ready to transplant into cold frames; this can be done any time during that month or December. Have the frames filled with rich fibrous soil to a depth of 8 to 12 inches; most any good soil will do, but in a light soil the plants will make the thickest bunch of roots and consequently carry better when shipped; but the plants can, if necessary, quite well remain in the seed bed until the sun gets strong in February. From 8 feet 4 inches each way is suitable space for the pansies while in frames.

### Winter Covering.

I have never found covering a necessity to keep the cold out, no matter how cold the weather may get; simply avoid excessive moisture, such as will gather where a light is broken. The best covering is glass; if you use that your plants are always sure to be early enough, as they will grow even in Winter, when the weather is mild. We use here, in conjunction with sash, lids made of 1/2-inch worked lumber of the same size as the sash; these lids can be used as a substitute for glass over such stuff as pansies or geraniums, and as a cover over the glass to keep the cold out of the frames or when pestered with dogs traveling over the snowbound frames at night.

### Ventilation.

During cold weather no attention need be paid to ventilation; it will take a great deal of sunshine to hurt pansies growing in a low frame; later on, however, when the sun gets strong, more care is needed, and you will want to ventilate freely to keep your plants stocky. You can regulate the earliness of your plants by the ventilation; if the Winter is warm and open, you had better ventilate well to hold them back and keep them robust. If pansies are sown much earlier than the 15th of August, they will, I believe, prove too early unless no glass at all is used and boards or such employed in place thereof.

### Lifting and Packing.

When your plants are ready for planting out-of-doors and you have grown them in light soil, they can most readily be lifted by forcing a fork under

a lot of them, and lifting the whole colony together, and then divide. Always water the plants a few hours before lifting them. When we lift pansies for shipment, they are packed tightly together in boxes, root down, without separate wrapping; we find they carry best in this manner, and are readily lifted out of the boxes on arrival at the destination.

We frequently pack two layers in one box, when we do, a lid or bottom is made to fit in the box right above the top of the lower layer, where it rests on four strips nailed to the sides of the box; this compartment is then filled as the lower one was, and if care is taken that no foliage or flowers extend over top of box, both layers will come out intact and fresh. The boxes are made of a uniform size, and can be packed one on top of the other in the cars without the least injury to contents.

### Planting.

The plants are then planted in such beds as are found suitable for display at various points along our lines of railroad in well-prepared soil. The distance between plants for immediate display is between 6 and 8 inches; a greater distance is advisable only where the soil is very rich, and they can have good attention.

The care after planting is of the greatest importance to insure a beautiful and tidy bed all Summer from April to October. If you plant your pansies in stiff soil, water well and keep seed pods off; you can keep your bed pretty all season, but in light or sandy soil a pansy bed will not look presentable after the beginning of July if planted early, no matter how much care is taken, I find that it does not pay to try to keep pansies alive even that long in a sandy soil and consequently we remove them sooner and plant something else in place.

### Varieties.

For a show at a distance and for hardiness and lasting qualities, I can particularly recommend Goldense, Lord Beaconsfield, Bronze, and Emperor William; these four varieties have proven most excellent under all conditions, and make a good show in a bed on account of the strong colors. For choice coloring and for effect, at short range, would recommend the Bugnot, Trimarceau, Marbled, Mahogany, Faust, and most any other good variety or strain such as recommended by our seedsmen. For a good distance effect the bed must be 10 to 12 feet, not less, and plant one strong color in center and a border not less than 12 to 16 inches wide of a supplementary or contrasting color around the bed; the yellows, blues, or purples make the best borders for mixed beds.

If your plants are a trifle backward in March, apply a little blood and bone and rake it in and they will hurry up; never try to force them on bottom heat; it will not be a success.

A. E. WOHLERT.

### Mushrooms in Cellar.

Will it do to grow a few mushrooms in one's cellar? I mean, is there any danger of making things unhealthy for the occupants of the house.

I see in an old edition of Falconer's work that he does not think it out of the way, but I am not inclined to go ahead without further sanction.

—Whether to have a mushroom bed in the cellar or not is simply a question of convenience and susceptibility of the olfactory nerves. Otherwise there can be no real danger and usually the mushrooms do well. Many of the market gardeners of Lancashire, England, build their houses on piles and use the cellars for mushrooms and forcing rhubarb.

### Spraying.

(To E. D. James)—What to use as a spray depends upon what it is to be directed against. Thus for chewing insects, Paris green is the thing; for suckers use kerosene emulsion; for scale, whale oil, and so on.

## Growing Black Walnut for Timber.

There has come to be a widespread notion that fortunes can be made in a very few years by growing Black Walnut for timber. If the idea, erroneous as it is, were to result in the extensive planting of this valuable species it would result in great ultimate good, though it is doubtful if any of the planters would live to harvest their crop. The Black Walnut is a rapid growing tree when planted under favorable conditions, but it does not develop the rich dark color that gives to the wood its peculiar value until it approaches maturity, or at an age beyond one hundred years.

I know of trees only thirty years old that are over sixty feet in height and ten inches in diameter at breast high. But the wood of these trees is sappy and light colored, showing none of the richness that makes the timber sought for furniture and finishing purposes. It is the color that gives value to the wood, and young trees cannot be sold at a price much beyond that of any other species. And yet, given a deep fresh loamy soil, such as that of river and creek "bottom" and "second bench" lands, and I doubt if a better crop could be grown in odd corners, or where land is cheap.

The nuts should be planted where the tree is to stand, shortly after they drop from the tree. It is unnecessary to hull them. They should be covered about one inch deep, and will ordinarily grow a foot high the first year. They are easily transplanted when one year old, but as a heavy tap root is formed they are difficult to reset after the first year.

For timber they should be grown among other trees that make a denser shade. These are called nurse trees, and their purpose is to prevent the walnut from branching low, and forcing its stem straight and tall. Red and Silver Maple, Russian and native Mulberry, and Box Elder are all good nurses for Black Walnut. Suppose all the trees stand 4x4 feet apart, then each walnut should be surrounded by nurse trees. This would place the walnuts at least 8x8 feet apart. I would prefer to make the entire plantation 3x3 feet, placing walnuts at 9x9 feet, this would require 537 walnut trees per acre, and a total of 4,840 trees per acre.

The rate of thinning would depend entirely upon the development, and this in turn depends on many things: soil, exposure, rain, humidity, winds, and all the conditions of a locality that can influence tree growth.

As to the number of trees that should stand on an acre at a given age, and the value of a walnut plantation at any given time, such subjects are too speculative for discussion, and any attempt at a didactic statement would be absurd.

Fashions change in woods as well as in bonnets, and because Black Walnut is a prized tree to-day, it does not of course follow that it will be so a hundred years hence.

CHARLES A. KEFFER,  
Division of U. S. Dept. of Agriculture.

## The World's Apple Crops.

The annual report of W. N. White & Co. (Ltd.), London, on the European and American apple crops is in part as follows:

England, with the exception of early apples in the home counties, has a very bad crop, the worst crop of winter fruit that has been known for many years.

France, in the south, is short, and there are only moderate crops in the north; cannot export many except at high prices.

Belgium.—Very poor crops. Prices at present are ruling very high throughout. Belgium will, later on, no doubt, be a buyer of American red apples.

Germany.—Very bad crops indeed. Orders are expected to be sent to England from time to time for red fruit.

Coming to your side; Nova Scotia last season exported to the United Kingdom 410,000 barrels; from information obtained from reliable sources I can only estimate the crop this year from 150,000 to 160,000 barrels, in addition to which,

I am told, the quality cannot be reckoned as good.

Canada last season shipped to the United Kingdom from the port of Montreal, 700,274 barrels; this year the crop will not exceed 200,000 barrels, of which the larger portion will be Greenings and Northern Spy; choice red fruit is likely to be scarce.

New York last season shipped us 570,000 barrels, but this year, unless fruit is brought from the far west (for which

lot of wormy and bad fruit, which came forward in November and December, whereas this season the states, unless they draw largely from the West, cannot total more than 1,000,000 barrels, certainly not so many as was sent here in 1894-95; and as there is not much fall fruit in Canada this year to spoil the market we think fair stock will realize good prices.

## The Vegetable Garden.

**Cauliflowers** for late use can easily be grown by utilizing some of the cold frames. Prepare a bed the size of the frame intended to be used, by manuring with well decomposed dung, forking it over deeply, and on soils liable to club root add a sprinkling of fresh air slacked lime. In this bed set out, 18 inches apart each way, well established plants that have been previously transplanted. Cultivate often, water thoroughly when necessary. As soon as cold weather is at hand, set the frame in position, leaving on the sashes on cold nights and days. All the air possible should be admitted whenever the weather is congenial, by raising the sash at the rear or higher part; this should always be done when the temperature outside is over 40 degrees. In mild seasons this excellent vegetable can usually be had by this method, until Christmas, if properly attended to. For this purpose there is no better variety than a good strain of the Early Snowball.

**Cultivate the Endive.**—A good supply is very useful for winter. Just before hard frost, the roots should be carefully dug up with a ball of soil, and stored away in a dry, cool, airy place, and protected from frost. In November a few roots can be brought in every two weeks, and placed in gentle heat in a somewhat dark position. Under the greenhouse benches, but not in close proximity to the heating pipes, is an ideal place for them, as in such a place they will immediately commence to grow nice white leaves, which are highly appreciated for salad.

**Radishes** may now be sown in cold frames, they will always grow whenever the temperature is above 35 degrees. They can also be easily grown in mild hotbeds. Radishes should be sown thinly, and given all the air possible on bright days and water early in the mornings when they require it, so that the foliage may be dry when the sashes are closed in the evening.

**Turnips and Beets**, if old enough, should be pulled up on dry days, and stored away in a cool pit dug in the ground, or a better plan is to sink a few barrels in well drained ground, into these put in such vegetables, and they will keep splendidly. They should be covered up with some loose material such as straw or salt hay, which allows ventilation to enter. Both these vegetables will continue to grow for some time yet, but, if at this date they have grown to normal size, it is much better to pull them and store away, as if left growing the turnips will become spongy and ultimately rot, and the beets will only be growing more tough with advanced age, and this class of vegetables is not needed anywhere.

**As Crops Mature** clear them off the ground, it is then an easy matter to prevent crab grass and all other obnoxious weeds from growing to seed, by hoeing the cleared ground and clearing away all weeds. If one is not careful at this season with the seeding weeds, the ground will become infested with weeds for all time. After the potatoes are dug, do not abandon the patch to become, as we so frequently see it, overgrown with tall weeds of every description, if these cannot be kept down, plow them under before they seed, and they will add nourishment to the soil, instead of robbing the soil as would be done if allowed to grow.

W. M. EDWARDS, Conn.

Sylvester Newhall, a pioneer nurseryman and prominent citizen, died at San José, Cal., on August 27.

FIG. 187.—NEW TYPE OF CYCLAMEN, CRESTED.  
(See page 661.)

there will be heavy railway charges), supplies cannot be reckoned over 200,000 barrels; reports from this district also speak of a shortage in red fruit.

From Boston last season we had something like 1,000,000 barrels, but fear the quantity this year will be only one-quarter that number.

Seeing that there is likely to be a shortage of red fruit from Canada and New York, we think this should leave a good

FIG. 188.—NEW TYPE OF CYCLAMEN, DOUBLE.  
(See page 661.)

opening for best reds from Massachusetts and Maine.

Now, looking at the European prospects generally, we say, and say it without hesitation, that there is a greater opening for American fruit this season than last. Last season the combined ports of America and Canada shipped 2,919,846 barrels to Europe, all of which made good prices with the exception of a

## Diseases of Shade and Ornamental Trees.\*

By B. T. GALLOWAY AND ALBERT F. WOODS.

(Continued from page 660.)

Cracks occur in a great variety of trees during very cold spells, especially when the fall of temperature is very sudden. It is a well-known fact that trees shrink under the influence of intense cold in the same way that felled timber does in drying. This shrinkage is due to the withdrawal of water from the cell walls, in the first case by freezing, and in the second by evaporation. The extent of shrinkage is dependent upon the amount of water withdrawn. The cell walls of the outer new wood usually contain more water than do the walls of the heartwood. The outer wood will shrink in drying more than will the inner wood and will therefore split. The chance of splitting is greater when the outer wood layers freeze before the inner ones, as they do during a sudden fall of temperature. This is Hartig's explanation of frost cracks and the one which has the most experimental evidence in its favor. Other explanations have been given, but it will be unnecessary to discuss them here. The cracks usually close up again during warm weather and ultimately heal over, doing little damage to the trees from the standpoint of this article.

Preventive measures.—The injuries to the trunks and branches by alternate freezing and thawing and the diseases resulting from them may be prevented by shading the parts exposed to the sun by means of a board set up on the south side of the tree, or, as is sometimes done, by screening the parts with straw, burlap, building paper, or other material which may be easily fastened to the trunk and branches. When once injuries of this kind have been produced, the dead areas should be cut out down to the healthy wood and the wound thus made covered with coal tar, varnish, or "hard oil."

### INJURIOUS GASES IN THE AIR.

In the vicinity of manufacturing establishments and often in cities and villages where large quantities of bituminous coal are used, vegetation, especially trees and other woody plants, are frequently seriously injured by the fumes which are thrown off into the atmosphere. Smelting works, fertilizing manufactories, brick kilns where soft coal is used, and similar establishments are the principal agencies involved. Frequently the injuries may be limited to a small area immediately adjacent to the factory or other place from which the fumes are given off. Again, the effects of gases may be seen for several miles, usually extending farthest in the direction of the prevailing winds. The effects of such gases on the trees are various, and it is often difficult to distinguish the injuries produced in this way from those resulting from purely climatic causes. From the evidence at hand it appears that the chief injury in such cases is due to sulphurous and hydrochloric acids, acting singly or in combination. The effects of these poisons are shown by the leaves turning reddish brown in spots or along the edges and eventually drying up entirely. The injuries are cumulative, certain branches of the trees being killed each year, while the others may make a feeble, struggling growth, owing to the cutting off of the food supply through the injuries to the leaves.

Preventive measures.—The question of remedying or preventing such evils is an important one and may often involve complicated legal questions. It may happen that the establishment of a factory in a certain neighborhood will result in much injury to farmers in the immediate vicinity by destroying their trees and crops. All the evidence goes to show that little can be done towards mitigating the trouble in the way of special apparatus for connecting the gases, high chimneys, etc. The question therefore resolves itself into one respecting the rights of the farmer on the one hand and the factory owners on the other. These

matters, however, are beyond the province of this article.

### FUNGUS DISEASES.

All portions of the tree are subject to the attacks of fungi—minute parasitic plants, whose vegetative parts, known as mycelium, penetrate the tissues and by their action on them cause the various forms of blight, rot, etc. The fungi are rapidly propagated by means of spores and also in other ways, which do not concern us here. There is a very close relation between these organisms and the various other factors, such as the condition of the air, soil, etc., already discussed. In other words, the growth and development of the fungus parasites are intimately related to the condition of the host, which is in turn, as we have already seen, materially affected by the weather and by the soil. There are many fungi which under ordinary conditions could never injure a tree, and yet if by some chance a favorable opportunity is offered they may prove quite destructive. For example, a limb may be blown or cut off, hail may make a bruise, or in other ways wounds may be produced and in these the spores of certain fungi may lodge and germinate and start decay that could not have been produced in any other way. Trees may succumb to the attacks of fungi only in certain stages of growth. Thus, young conifers are seldom affected by the disease known as canker, because any wound made in the trunk or branches is quickly covered with a coating of resin which prevents the spores of the canker fungus from developing. When the trees get to be quite old, however, the wounds are not covered with resin and the spores of the canker fungus fall in these places, germinate, and spread into the surrounding tissue, and the tree is killed. On the other hand, the young, tender, rapidly growing tissues are more susceptible to the attacks of certain fungi than those older and better matured. With these introductory remarks, we may now pass to some of the diseases in detail.

### ROOT DISEASES.

In considering any case where fungi are found attacking the roots the importance of the previous effects of soil conditions must not be overlooked. An injury or a weakened condition produced by any of the means already pointed out may permit the entrance and development of some disease-producing fungus which might not otherwise gain entrance or find suitable conditions for development. On the other hand, there are fungi, which, while they are better able to develop under these conditions, are nevertheless able to gain entrance into and kill what appear to be perfectly healthy roots.

Southern Root Rot.—This disease, which is produced by a fungus known as *Ozonium auricommum*, attacks a great variety of trees and other plants, including the elm, basswood, oak, cottonwood, mesquite, china tree, mulberry, etc. It also attacks cotton and the sweet potato.—In fact, no plant appears to escape except the plum and some closely allied groups.

The disease first becomes apparent by the sudden wilting of the leaves, and soon the death of the tree follows. Examination of the tap-root and many of the other roots shows them to be dead and partly rotten, and thus unable to furnish the top with water or food. Trees growing in well-drained and well aerated soils are seldom attacked, while those in soils very retentive of moisture are the first to succumb. The disease is confined largely to the Southern and Southwestern states, and is especially bad in wet seasons and where excessive amounts of water are used in irrigation. If the roots are examined closely, a whitish or usually yellowish-brown growth of loosely interwoven, hair-like threads will be seen on the surface and in the decaying tissues. These are not confined to decaying parts, but attack apparently healthy roots. Once inside, the fungus spreads rapidly through the cortex and wood, killing the cells and causing their decay. Only the mycelium, or plant body, is known, and this is reproduced from branches or pieces which may be broken or washed off. It has been observed growing in decaying vegetable material taken from the side of

an irrigating ditch which furnished water for pears, cottonwood, alfalfa, and other plants dying from the disease. It is probable, therefore, that it may sometimes be distributed in this way. It spreads along roots and decaying material from plant to plant through the soil, and its distribution may also be hastened by tools used in cultivation.

(To be continued.)

## Sutton's Peachblow Tomato and Others.

To the Editor of American Gardening.

In your issue of August 28, Mr. Anderson gives us some valuable information in regard to his tests with tomatoes under glass, and it may be of interest to the readers of AMERICAN GARDENING to know how some of the English varieties behave in this country grown outdoors.

At the head of the list we would place Sutton's Peachblow. This is without doubt the finest tomato we have ever seen or grown, the fruits are of large size and of fine quality, and are borne in long clusters with from four to eight fruits to a cluster. It is a heavy cropper and no doubt will become a standard variety when better known. It is also an early tomato coming in as it did nine days after Sutton's First of All, and twelve days ahead of Perfection (American).

Sutton's Best of All, with us, comes next to Peachblow. It is a fine tomato, a heavy cropper and of good flavor, and is equal to any American variety we have ever grown, one very good point about this variety is that every fruit we have gathered has been perfect, and the same can be said of the Peachblow.

Sutton's Earliest of All. The fruit of this variety is of medium size but sometimes not very smooth, but its earliness commends it as we used it nine days ahead of any other variety we had. It is a good cropper and flavor also good.

Sutton's Magnum Bonum, like the Peachblow comes in long clusters; the fruit is of large size and of good flavor; a very rank grower and ripenes the same time as Peachblow; a very heavy cropper.

Sutton's Dessert is a small red tomato of fine quality. The fruit is produced in long clusters and when grown as a pot plant it has a novel appearance. I grew some of it last winter and would advise anyone who forces tomatoes to try a few of it, as it sets so freely and makes such fine show that no one can help liking it. Outside it does just as well.

Sutton's Sunbeam is the best yellow we have ever tried; we like it better than Prince of Wales or Golden Nugget, the fruit is in very large clusters about the size of a hen's egg; it is very ornamental and of fine quality. It is also a heavy cropper.

These tomatoes spoken of are all All; we have others, but the five varieties mentioned are the ones which have done the best in outdoor culture, and I think it would be a good plan if some of our American seed firms would catalogue a few English vegetables of the various kinds. Some of them are well adapted to our climate, and in fact Sutton's Favorite lettuce with us this year was the finest lettuce we had in the garden. Now it is very unhandy for some of us who only want a few seeds from "the other side" to be sending away over there for them. Never mind though the seeds be English, German, or French, if they are any better than or outclass any of our American sorts, by all means let us have them.

DAVID FRASER, N. J.

### San Jose Scale.

Experiments with sprays against the San Jose scale have been carried on at the New Jersey State Experiment Station. Dr. J. B. Smith reports that we have been all wrong hitherto, and instead of winter applications, summer work will, it is believed, prove most satisfactory, and kerosene, undiluted, most effective.

Spray thoroughly in September, all infested bearing apple, pear, plum, and peach trees, with undiluted kerosene, during the middle of a clear, sunny day.

\*In Yearbook of the U. S. Department of Agriculture 1896.

## The Fruit Garden.

**Plums.**—Look over the trees for black-knot, and if any be found cut out and burn.

**Plum Juicy.**—When visiting the nurseries of John Lewis Childs at Floral Park, Long Island, in the early part of August, my attention was attracted to a tree, apparently a weeping variety; on closer inspection it proved to be the plum Juicy, one of Burbank's productions, from crosses with some of the Japanese varieties. The long slender branches were literally covered with light-green fruit and weighted down so that this tree looked like an overgrown bush. On August 31 the fruit was fairly ripe and dropping from the tree. Mr. Miller, the superintendent, gave me some of the fruit. I then was not favorably impressed, except by color. The box containing them was placed with the cover off, in an ordinary light closet and the contents have been gradually used, so that what were left September 12 looked like imitation wax plums of a bright scarlet color with minute specks of light yellow (the flesh color) showing through the rather tough thin transparent skin, which skin no doubt accounts for the long keeping quality of the fruits, which is then of a surprising honey sweetness. These plums were 1½ inches in diameter. What the size would have been had some of the immense crop been removed, can only be conjectured but I am willing to buy and find out later. Another point is that, anyone growing it, will not lose the crop by Curculio.

**Pruning.**—Now is a good time to note where the branches are so thick that the sunlight does not reach all parts of the tree. The same tree without foliage would not appear to need thinning. Paint all cuts.

**Order Any Apple or Pear trees** you need, and prepare good large places for them. How many poor starved stuck-in-a-post-hole trees one can see driving around in the country, and all because they are only apples or pear trees that will grow (or die) anywhere.

**Plums or Peaches,** in fact all stone fruits usually start better if planted in the spring. That fact need not prevent the places being prepared for them this fall, when there is more time to do it properly, and don't forget the manure, if it is good get some of it as near the roots as possible without actually letting it touch.

**Fruits in Season.**—Crawford's Late Peach, Schuyler gage, and Coe's Golden Drop plum, with plenty of grapes, with Seckel and Sheldon pears will supply the table until October. By the way the German prunes are fair eating by the first of the month. J. HOLLOWAY, L. I.

## Adaptation of Varieties.

The question often arises, "Are certain varieties of fruits adapted to certain soils and conditions, or not?" This is an age of specialties, and I believe the grower who finds out the varieties which give him individually the best results, will, in the long run, be the most successful.

We have varieties which succeed almost anywhere and everywhere. The Concord grape, Ben Davis apple, Bartlett pear, and Crescent strawberry being good examples, but does it always pay to plant these varieties? Every other fellow can do the same. But if we find some especial kind suited to our situation and grow it largely, it pays far better. The Elberta peach made big money when first introduced and really gave Georgia its peach boom. The Albemarle Pippin apple has done the same thing for portions of Virginia. Never have I seen finer strawberries than the Parker Earle on J. H. Hale's grounds. Still, with me this variety is worthless. The same may be said of Beder Wood. I believe the grower should endeavor to select those kinds that are best adapted to his own particular wants and grow them. Such varieties may be found.

In some portions of Michigan extra early peaches pay. They do not rot there, but to plant them in Delaware

would be utter folly. Likewise it is next to impossible to raise plums of the *Prunus domestica* type here. At the same time those of the native and Japan types are great successes. I know of men who grow fine crops of Reeves' Favorite peach, and get big money out of them, but on an adjoining farm the same variety may be an utter failure.

The Lady Thompson strawberry is largely planted in portions of North Carolina, while with us it is of little value. Instances come up every day to prove the truth of what I have said.

I believe in the near future the progressive fruit grower will test a number of kinds and retain that which suits him best. Perhaps he will not stop at this, but originate his own varieties. In this he will be guided by the markets he intends to supply, and by other demands. As an instance, examine local nurserymen's catalogues and you nearly always find some local variety highly praised up. Some grower has made a success of it.

There are many points about fruit growing which are as yet but little understood, and I believe this adaptation of certain varieties to the wants of some specialist is one of the developments of the near future. CHAS. WRIGHT, Del.

## Chrysanthemums.

**Watering** is the rock on which the boat of many a good man's hopes gets wrecked. Some people have an idea that a Chrysanthemum cannot have too much water once it is well established. The result of such a policy is always seen in a long thin stem and pale sickly foliage. Season must be largely considered and while plants take a good deal of water during hot summer we are now at a cooler period and shorter days. Pot plants are now full of roots and must needs be kept well supplied but the benches should not be allowed to get into a muddy condition.

When watering do the job well and then let the bench get into a moderately dry condition before repeating. The roots work best when the soil is neither wet nor dry and my experience has been that the old roots rot as quickly as young ones are made when they have nothing but a wet pasty mass to work in. When this is the case it is certain that the bud cannot swell so well as when every root is sound and doing its share to help push a good thing along.

Where mulching with cow manure has been carried on it sometimes bakes into a hard mass and the water cannot pass through it when the soil beneath may be almost dust dry. Again when plants are in boxes, as many of ours are, the ends sometimes come apart and what might have been meant for a good watering has most of it run outside. All these things are insignificant in themselves, but they must be guarded against for "mony a mickle mak a mickle."

**Specimens** should now be pretty well into shape and no more tying should be done than can be helped. The less tying they get from now on the more natural will they look when exhibition time comes.

**Tidiness.**—Keep all dead leaves cleared away; refuse from the manure barrels and rubbish of every description also. The atmosphere will be sweeter and it is better for the plants, and all better for the eye. C. Torry, N. J.

Methods of grafting apples have been investigated at the Kansas station and the following conclusions are reached by Profs. Mason and Jones: Whole root-grafted apple trees are of no greater value than trees from clons grafted on piece roots from two and a half to five inches in length. Grafting above the crown of the seedling has no particular merit over grafting below the crown. While roots or very long pieces may have some slight advantage, but these do not compensate for the extra labor and expense in securing them. The greatest uniformity in growth is obtained by the use of grafts that secure an earlier rooting of the clon.

## Injury to Rhododendron Leaves.

Would you be kind enough to advise the best method for protecting leaves of Rhododendron from enemies that eat them? I tried powdered hellebore, but find I have injured one variety.—VOLNEY ROGERS.

—We have never been fortunate enough to find any insects feeding on the leaves of Rhododendrons, so cannot answer V. R.'s query, except in the following manner: A species of "lace-bug" (*Tingitidæ*) feeds upon the leaves of Mountain Laurel (*Kalmia*). It does not devour the tissue of the leaf, simply sucks the juices out, the same as plant lice do. For these pests either kerosene emulsion, Fir Tree Oil, Antipest, Cedar Oil, or some such thing should be used. On Long Island Rhododendrons are troubled with a spot disease. This disease causes the leaf to turn brown in spots. In time these spots fall away, hence the leaves appear to be eaten full of holes. Thorough spraying with Bordeaux mixture will prevent this trouble, and, if a little Paris green (one-fifth of an ounce to every barrel of the mixture) is added to the Bordeaux mixture no leaf eating insect will trouble the plants.—F. A. S.

## Mealy Bug in the Garden.

The leaves of Marigolds all turn nearly white and then die. I send you some of the leaves and also stems of Coleus; these also die and seem to be covered with a number of white bugs. Will you please to tell me what to do.—G. O.

—G. O.'s Marigolds are infested with the common mealy-bug (*Dactylopius destructor*). The peculiar cottony masses noticed on the leaves are the cocoons of the males of the mealy-bug; within these cocoons the males change from a wingless to a winged insect. The mealy-bug is one of the worst insects with which forcing-house men have to contend. Thorough spraying with kerosene emulsion, or some of the oils advertised for aphides ought to control the mealy-bug on out-of-door plants.

## Exhausted Peach Tree.

What is the best treatment for a peach tree about six years old which for two years past has been bearing an abundance of large beautiful peaches of fine flavor, but this year though this is an abundance of fruits they are very small and bitter.—H. I.

—Evidently, the tree has partially exhausted itself by excessive fruiting, and what it now needs is liberal feeding. Work some good stable manure in and in addition at some time when growth is active use a little potash in the form of wood ashes.

## Propagating Althæas.

H. I. can increase the stock of her particular Althæa by budding. To do this a young plant two or three years old is needed. The stock may be raised from any kind by sowing the seed, or a chance seedling may be found somewhere, or any nurseryman can supply it at a very low cost.

## Moles in Lawns.

A reader asks how he can rid his lawn of moles. A persistent use of traps is the only method that we know of that is effectual.

## Violets.

"Subscriber," Richmond, Va., is informed that no notice can be taken of his communication unless full name and address are furnished.

One of the most essential points in successful orcharding is the proper selection of varieties. That means not only varieties which in themselves are good, but which are also adapted to the locality.

The liabilities of the Highlands Nursery, Kawana, North Carolina, having been satisfied in full, the entire property has been re-deeded to Mr. Harlan P. Kelsey, the proprietor, by his late assignee. Mr. Kelsey has opened an office at 1128 Tremont Building, Boston.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 15, 1894.

PUBLISHED BY

A. T. DELAMARE PTG. & PUB. CO. LTD.

ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.

Telephone, 2154 Cortlandt. P. O. Box 1697.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florez, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms.—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions.—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to creditsame.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per agate line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## WANTED.

Copies of AMERICAN GARDENING for March 6, 1897. Address the Publishers.

## The Village Square.

As previously announced, we have had prepared a model plan for The Village Square. As considerable thought has been put into it, and in view of its general value, we have decided to present the plan as a special supplement with the next issue of AMERICAN GARDENING.

## Our Two Native Hazel Nuts.

THE common American hazel nut (*Corylus Americana*) is more or less abundant everywhere in the Eastern states, growing along the borders of forests and old fields, and generally in fence corners and against stone walls forming dense thickets, the result of its habit of throwing up an immense number of suckers from the subterranean stems and roots. The nuts have a rather hard shell, and while the kernel is sweet the small size is so much against them that they are not considered of much value except as food for squirrels. The husk in this species is composed of two smooth, leaf-like bractlets with fringed or deeply lacerated margins, extending beyond the end of the nut as in the European filbert. A less common native species is known as the beaked hazel (*Corylus rostrata*) found

mainly in the north, extending sparingly southward along the mountains. In this hazel the plants do not multiply by suckers as in the former, but from the scattered nuts there growing up into a single stem at first, but later sprouts usually push out from the base until we eventually have a many-stemmed, dense, erect bush four to six feet high with slender straight twigs. The nuts are small, broadly ovate with a blunt point. They are usually produced in pairs, the husk united at the base and covered with short nettle-like hairs, and prolonged into a contracted cylindrical tube an inch or an inch and a half beyond the nut. The husk adheres rather firmly to the nut, rarely opening to allow the nut to fall out while attached to the plant, and it is somewhat difficult to extract them even later, especially if ones fingers are at all sensitive to the punctures of the irritating hairs. This beaked hazel is found wild from Maine to the Pacific coast, and in "the typical form of the Atlantic states occurs in Washington Territory and Rocky Mountains." (Botany of California, vol. 11, p. 101.) But in the work quoted the bushes are said to grow from three to

as original matter the best articles and reports in them, and this without giving any credit whatever. It may be economical to get other editors to do your work for you, but it is not straightforward. Readers of AMERICAN GARDENING can congratulate themselves on very often having first pull on some interesting topic which during subsequent weeks reappears in the pages of some other publication. If the papers in question desire further identification we will gladly comply with the request.

## The Chrysanthemum Rust.

Hitherto growers of Chrysanthemums in this country have fortunately not been bothered to any great extent with the disease known as rust, and which manifests itself by the eruption of small circular dots of red-brown on the underside of the foliage. Lately our attention has been called to a bad outbreak of the trouble which is comparatively, a new one in America, and in an early issue we hope to say more concerning it.

## Premium Notice.

All the Henry Strawberry Plant Premiums to date were mailed on Monday

FIG. 189.—THE BEAKED HAZEL.

six feet high in the Rocky Mountains, but, said the late A. S. Fuller, residents of those regions with whom he had corresponded for years, assured him that this beaked-hazel often assumes the tree form, growing to a height of 25 feet or more, with a stem five or six inches in diameter. In proof of this assertion Mr. J. J. Harnden, of Marion Co., Ore., forwarded him a section of the stem of one of these trees five inches in diameter. This specimen was obtained in the mountains of northern Oregon and the correspondent assured him that it is not an exceptionally large one. Shortly before his decease, Mr. Fuller received a box of the nuts from Mr. Harnden; these differ somewhat from the Eastern type in their deeply corrugated husk and rather more open, and the deeper cut end of the tube as shown in the accompanying illustration. The nuts also have a decidedly and regularly depressed base at the hilum or scar which is surrounded by an evenly-raised border. Query? Would it not be well for some of our nurserymen to introduce this free form of beaked hazel, although it is probably nothing more than a local variety of the species.

To Certain  
Contemporaries.

ONE way of making up the reading matter of a paper is to sit at a desk, read through contemporary publications, cut out and use

last, September 20, in A1 condition, from the local post office of the district in which they were grown. The total weight of plants mailed exceeded, according to the postmaster, the largest and heaviest mail ever previously despatched from that office. Amongst other points to which plants were shipped was Nova Scotia, British Columbia, and many of the far Western and Southern states.

## Treatment of Plants on Receipt.

Enquiries from some readers necessitate the advice to set out the plants at once on receipt, wetting them if the sun be very hot, and shading them in the middle of the day. There is no necessity whatever for anyone to put the plants into a cellar for a day or two before planting out.

## The Henry Strawberry is Controlled exclusively by American Gardening.

Mr. Jerolaman wishes it to be distinctly understood that he is not a nurseryman, but is a fruit grower; it is not his business to sell plants. Hitherto he has disposed of a few plants in order to have the variety generally tested. For the future, however, the Henry strawberry plants will be distributed only as premiums through AMERICAN GARDENING.

Plants will be delivered from now onward through the month of October, or until the ground freezes which in the place where the plants are growing is not until December. Mr. Jerolaman always sets out plants for himself until the middle of November, and in some seasons even up to the end of that month.

## BIG BERRIES FOR ALL.

Being the Cultural Methods of Henry Jerolaman, the N. J. Strawberry King, Preceded by an Autobiography.

*Continued from page 651.*

I always set the plants in raw ground; that is, in land that has been in cultivation for one or more years, land that has grown a good crop of potatoes is best, and if the potatoes have been well cultivated there will be few weeds on such land. Soon as potatoes are dug, about September 1 (before the weed seeds ripen), I plow in a good coat of well-rotted barnyard or stable manure, not too heavy a coat, or you will make your land too light and thus burn the strawberry roots.

If your land is very rich there need not be any manure plowed in (at the time plants are set), but when plants are set and start to grow then cover each side of row close up to the plants, but not so as to cover them, with a good heavy coat of well-rotted manure extending one foot on each side of the row. If well-rotted there will not be any weeds to bother you, and besides, it will protect the plants from that constant freezing and thawing in the middle of days in winter, thus throwing them out of ground.

In field culture set the plants always in rows not less than 2 feet 10 inches apart, plants 9 to 10 inches apart in the rows, and as soon as weeds start, cultivate with one-horse harrow tooth cultivator so as not to cover the leaves of plants with the soil.

In garden culture you may set the plants somewhat closer if cramped for room, say, rows 2 feet 6 inches apart, plants in the rows from 6 to 8 inches apart.

Now we have our plants properly set; what I mean by being properly set is, that the plants must not be set too deeply, so as to cover the center or crown, nor yet set too shallow; the crown must be set just level with the earth; if too shallow it will dry up and die unless very wet; if set too deep, it will not throw out fruit stems, but long slender leaves will be all you will ever have on the plant. Many wonder why they have fine plants and no fruit.

In getting the ground ready for setting plants we must always plow the land twice (as our ground is clay bottom and becomes very hard and lumpy in dry weather). At the last plowing we do not allow the horse to walk on the plowed land or the man either, but they go in the furrow and after every four or five furrows, rake smooth with an iron-tooth garden rake; standing in the furrow we can easily reach the four or five furrows without stepping on the plowed part. When the bed is ready, we use a common ball of white cotton cord or grocer's twine, costing about 5 cents per ball, stretch our line tight as possible, using a measuring stick at each end of row. Some of our rows are 300 feet or more in length, and if line does not touch land in the center we pin it down by putting two sticks across it where too high; then we set just as close to the line as we can without disturbing it. You will be surprised to see how straight the rows are by this means. If land is stony we use a common garden trowel, sticking it down first, then opening out the cavity thus made, by the hand; taking plant from the plant box with the other hand, and shaking out the roots set it in the cavity made by the other hand or trowel, until the crown of plant is level with the land; then, removing my hand or trowel from the cavity, I press the soil on other side of the plant with both hands. It is all done in a moment, in much less time than it takes to tell, and I can set out with ease 2,000 plants in less than one day (ten hours) by having some one to take up the plants and carry them to the setting bed for me.

If set as stated, the plants are properly set and ready to be covered with salt hay as soon as ground freezes. See that your plants are hoed and cleaned from all weeds and grass before the ground does freeze; this is about December 1st with

me. I cover the plants just deep enough with salt hay, or any other kind of mulch that is free from seeds, so that you cannot see them through the hay—one inch is deep enough, and there is also at least six inches on each side of the plant. I cover nearly the whole surface as I can get plenty of salt hay here cheap, 30 cents per 100 pounds, delivered; but please remember that you must not ever plant too deeply, or you will smother the plants, rot the leaves, and give protection to field mice to work and burrow among the plants, thus almost destroying your beds. The only necessity for covering the plants at all is that my land will freeze and thaw during warm spells in winter, thus throwing or loosing the roots of plants from the soil, and that the only necessity for covering is to have it just enough to keep the midday sun from thawing the earth around the plants. If the land does not heave or freeze and thaw then I would not advise any cover at all.

As soon as warm weather in spring opens or grass starts to grow (here it is last week in March or not later than April 5), I remove all covering, stack it, and if any weeds or grass seeds start, I cultivate or hoe my plants, then soon as the plants bloom, or just before the last of April or not later than May 5, I put back the mulch between the rows just as close up to the plants as I can without covering the leaves or fruit stems; the center or path between the rows is covered at least two inches; this acts for a treble purpose—keeps weeds down, ground moist, and fruit free from sand or dirt during rain-storms. I may add one more purpose served and in that one lies nearly all our success;—the Bible tells us that Sampson's great success or strength over others was in his hair; ours over all other growers of strawberries in the United States is just as simple as that, and I will state it did not get out through my wife, but by certain intelligent men who came here from all parts or from almost every state in the union during strawberry season (June), to see the strawberries growing. They would ask me certain questions. I would nearly always evade the point by joking or starting on some other subject. Reader, I do not wish you to think that I would prevaricate for the price of a little cherry tree; but for a large amount or something great, like other men, I honestly believe Henry Jerolaman could not trust himself. But I was well aware that if the secret were generally known, it was good-bye to Henry Jerolaman getting any more high prices for his strawberries in New York City. The secret of our success, as I call it, has been generally known about here for the past ten years or more, and that is one of the principal reasons why this section of New Jersey is known in every state for its strawberries. I first noticed it was getting beyond us in 1896, and last season this 1897, I noticed that fully one-half or more of the Southern strawberry growers had, as the boys say, "caught on," and are sending to the New York market just as clean and fine strawberries as we do. But we still hold the fort by reason of our position, being so near the great market of the world. Our berries being carted direct by wagon to the city do not get bruised, and are in much more solid condition than those from the South. That is the principal reason that I advised AMERICAN GARDENING when its representatives called here to see strawberries growing and the plants, to publish something useful to all the people, as there is not a town (unless it be very, very small) in the whole United States that cannot support or pay one or two men to grow strawberries for it.

I have given you my mode of culture for the whole year, and if you follow it, that is set out plants in clean rich soil, keep clean, mulch in winter if the ground heaves, by action of frost, mulch between rows in spring, pick, eat, or sell your

fruit, that is all there is in strawberry culture; you cannot fail in strawberry culture unless you have or get poor varieties of plants. Simple is it not, and plain, all summed up in less than three lines?

Let us repeat and see if we cannot get it in two lines: Rich soil, keep free from weeds by hoeing, protect in winter, mulch in spring.

Now for our secret just as plain and simple, only one word—gloss; this can only be accomplished by mulching, and the best effect I ever saw was by using clean salt hay and freshly mown lawn grass, using the grass just as soon as it had wilted and before it became too dry like hay. The only object in letting it wilt is that we can get it between rows thick enough, and by lifting fruit stems gently so as not to break them, and pushing the wilted lawn grass under the stems, we had strawberries when ripe, to look just as if they had been varnished.

If the readers of AMERICAN GARDENING wish me to state just what effect this had upon the price of the first load of large strawberries ever sent to New York City up to that time, 1872, (only 450 quarts 10 crates, 45 quarts each), I will state it in a future issue and state price received, that is, if readers notify the Editor.

In a future issue I will state just how I take care of all our strawberry beds, and how long we keep each bed in bearing, and, also, if desired, will state what it costs to grow a first-class crop of strawberries on my place. In the foregoing it will be noticed I only give my method and am well aware that there are thousands of cultivators of the strawberry, and that many of them have grown strawberries perhaps before I was born, and that all persons have methods of their own. It is human nature for a man to think that his method is the best one; such an one I neither intend nor attempt to instruct, but I write this for the benefit of those that have never set out a plant or grown strawberries, and if I can benefit any one, I shall feel proud of it, and consider it as part pay for any trouble that I have taken.

I would like to say in regard to mulching and its effect on price of strawberries, that I honestly believe that the growers here are the first men that ever mulched for cleanliness in field culture on a large scale. It may have been done in the garden, but I have never heard of it. As long as I can remember I have always seen and have eaten strawberries covered with sand or dirt, and they still come to market in that condition and that is one reason why people do not like strawberries, or soon get tired of them. I saw thousands of quarts in the New York and Newark markets last June, fine berries covered with sand and dirt, sent up by Southern growers, and I can safely say, by some other nearer-by growers, for the people to eat. They did not sell for enough to pay for picking. But people are getting educated and will not eat berries covered with white or black sand, besides sand will not digest, not even in a chicken, and after eating sandy strawberries, we generally have a sandy feeling, and in a day or so do not like strawberries.

To this mode of strawberry culture I strongly object, as I think it very much injures the trade, but as I have stated, almost every cultivator of the soil thinks his or her mode the best—I have never yet seen a lunatic but what honestly believed the other fellow was certainly crazy! This assertion is made to turn either way, and if I am the lunatic I want the other fellow to mulch his strawberries so that the person who buys his strawberries will not buy and eat his sand, as it is impossible to wash sand clean from the berries and at each rain storm it is beaten onto them.

The Carman Peach, says the National Stockman and Farmer, merits the attention of all who are interested in choice peaches. It lacks a few days of being as early as Alexander, but is early enough, ripening about the time of Early Rivers, surpassing it in size while fully equal to it in quality and being free from rot. In addition the tree is thrifty, healthy, and a good bearer.

**PRIVATE GARDENERS.****Appointments and Doings.***Gardeners and others knowing of recent  
appointments and movings are requested to  
forward particulars of the same for publica-  
tion in this column. No charge is made.*Joseph Gibson, for many years gardener  
for the late Gov. E. D. Morgan, and more  
recently for Commodore E. D. Morgan at  
"Beacon Rock," Newport, died on Mon-  
day, September 13, from a ruptured blood  
vessel. He had been out driving and  
when a sudden rain came up his compan-  
ion raised his umbrella, which frightened  
the horse, and in gaining control of him  
Mr. Gibson received his death strain,  
barely arriving at the estate of which he  
had the care and alighting from the  
wagon when he expired.The ticket with the regular nomina-  
tion of officers and standing committees  
of the Massachusetts Horticultural So-  
ciety for 1898 has been published. The  
election will occur on Saturday, October  
2d. Patrick Norton succeeds John G.  
Barker as chairman of the committee on  
gardens. With this exception there will  
probably be no change in the officers this  
year.On September 15 a party of about 20  
horticulturists went to Morristown, Pa.  
on the invitation of Hugh Hughes, gar-  
dener at the State Hospital for Insane,  
and spent a very pleasant day looking  
over that immense institution. Mr.  
Hughes deserves great credit for the ex-  
cellent manner in which the grounds are  
kept. The principal bedding is in front of  
the administration building, the first  
thing to catch the eye being an immense  
bed with Ricinus in the center, edged with  
Salvia splendens; in two large tropical  
beds a new bedding plant was noticed,  
Cardoons were used to fill up spaces, and  
had an excellent effect. Coleus, Ageratum,  
etc., have all done very well here this  
season.The horticultural jury for the Nashville,  
Tenn., Centennial exhibition meets on  
September 28. It is composed as follows:  
P. J. Berckmans, Augusta, Ga.; J. H.  
Small, Washington, D. C.; and William  
Falconer, Pittsburgh, Pa.The southside parks of Pittsburgh, Pa.,  
three widely separated areas, have lately  
been placed under the superintendence of  
William Falconer, of Schenley Park.**Fruit at the Delaware State Fair.**The Delaware State Fair was held at  
Dover. While the display of fruit and  
vegetables was fine, nothing especially  
new was presented except a new white  
peach of the Chinese type exhibited by W.  
T. Case of Felton, and some chestnuts ex-  
hibited by J. W. Killen of the same place.  
The peach is somewhat similar to the  
Chinese Free, though more highly colored.  
Mr. Killen made a very nice display of  
nuts including two Japan seedlings, one  
very large, of good quality which has  
been named Killen, and another of very  
fine quality which has been named Fel-  
ton.—W. W.**Four Reasons for Fall Planting.**1. Plenty of time in the fall. Other  
work does not crowd so hard then as in  
the spring and the planting of trees and  
plants can be more thoroughly and satis-  
factorily done.2. Nearly a year gained. By becoming  
well-established before winter sets in they  
are ready for early and vigorous growth  
at the first opening of spring.3. Fewer failures. Through the cer-  
tainty of late fall rains, planting is more  
sure at that season. Ninety per cent. of  
the failures come from late spring plant-  
ing when followed by unfavorable  
droughts.4. No time in spring. Our springs are  
of such short duration that much  
intended work is left undone. Never a  
season goes by but some one says, "I  
intended planting this spring but I could  
not get around to it until too late."  
Nearly all hardy stock except evergreens  
can be safely planted in the fall.—THE  
GEO. A. SWEET NURSERY CO.**READERS' NOTES AND COMMENTS.**This space is devoted to short notes of experi-  
ence and observation, but not necessarily reflect-  
ing our own opinions. You, reader are trying  
new varieties, new implements, new methods. Let  
us have your verdict—short, pointedly. Possibly  
you may wish to comment on statements found in  
this or previous issues or to offer suggestions; let us  
hear what you have to say. In the multitude of  
counsel there is wisdom and safety. Write us often.**Violets.**—G. C. (who in your issue of  
August 21) asked "where Violet plants  
suitable for early flowering could be ob-  
tained is informed that many thousands  
of The Giant Russian Violet now in bud,  
can be had from Miss Le Sasser, No. 3202  
Prytanla street, New Orleans, La.**Getting Rid of Nut Grass.**—In your  
issue of September 11; William H. Seels  
asks how to get rid of nut grass. If he  
will plow the land two or three times  
after the first of August, the thickest  
patches of it will be almost entirely killed  
in one year. The nuts grow in the fall  
and if the land is kept plowed then, there  
will not be any seed for another year as  
the roots except the nuts all die.—C. W.  
KNAPP, Conn.**Poison Oak, Poison Ivy.**—On page  
358 AMERICAN GARDENING is an excellent  
picture of a spray of Poison Oak, also a  
well written editorial upon this terrible  
plant, and the matter is further taken  
up by a correspondent in last issue. I  
would be pleased to give a few more  
facts:Some twelve years ago I was working  
in a florist's nursery near Philadelphia,  
when, one evening, as I sat upon the  
porch of our boarding house a thunder  
storm took place, and a large tree near  
where I was sitting was struck. I went  
to within three feet to see the rent that  
the lightning had made in the tree, and  
the same evening I was suffering from  
Poison Oak. A plant was clinging to the  
damaged tree but I never touched either.  
I soon got rid of the effects.Some six years ago I went to Califor-  
nia, got employment in Golden Gate  
Park, where is a great quantity of Poison  
Oak growing; there I worked for four  
and one-half years and I continually  
suffered from its effects, whether I touched  
it or not. Sometimes men would be  
burning the roots, etc. I would be going  
by and receive a small puff of smoke, and  
would be immediately attacked with a  
burning, itching inflammation. I have  
been attacked from head to feet, my eyes  
closed and nearly blind. I have had the  
best medical assistance, and have tried  
many things, alcohol, sugar of lead, salt  
and vinegar, camphor, and received little  
or no relief. If when well, I passed to  
windward or in the plant's vicinity, I  
had a fresh attack. If I changed my  
clothes and laid them by for a week or  
two, and get well, when I resumed the  
clothes again I had as bad an attack as if  
I had handled the ivy. A man who  
worked with me handled the Poison Oak  
without suffering any ill effects, he would  
take the influence home in his clothes,  
and his wife suffered martyrdom in con-  
sequence.I came here in May last, as head gar-  
dener, we have a great number of very  
large oak trees, which are covered with  
the wild grape vine, and are being slowly  
killed. I ordered one of my men to cut  
through the stems of the vines, and he  
also cut through a Poison Oak, of which  
the stem was over two inches in  
diameter. This tree is only a few feet  
from my cottage, and in one week after  
cutting, the leaves had withered, emitted  
a sickly scent, I had to pass it daily, and  
had a fearful attack of Poison Oak, no  
sleep nor rest for four days and four  
nights, the inflammation and itching were  
maddening. A high wind came and blew  
away all the leaves and now I am about  
well again.I am very fair complexioned, with a  
very thin transparent skin; I have a  
strong constitution, never suffer from  
any illness, and am over 50 years of age.  
The poison makes blisters, and if their  
water is taken up, on the hard part of the  
finger and placed upon the soft part of  
the arm or body, the place will be imme-  
diately infected, also if clothing takes up

the water, and is laid by for two or three weeks and reworm without washing the effects will result. I know several men who handle Poison oak without any troublesome effects, but in every such case their skin is thick and hard. Poison oak is a surface disease, and thin skinned people will take it every time.—G. M. SRATTON, Fla.

#### Replies on Diseases.

Correspondents' names have been mislaid, but they will each recognize which instruction is personal.

The samples of diseased beans show unusual development of the bean mildew, and by the way, this belongs in the same genus with the potato rot, and bears the botanical name of *Phytophthora phaseoli* Thax.

The peach leaves are beyond our determination. They would seem to be leaves of a tree with insufficient root action. Very likely the root may be badly infested with root galls; the rose leaves from same source are infested with a form of black spot.

The Fall River correspondent with diseased Phlox will have to send better material before an investigation can be made. We incline to the belief that the trouble is due to inattention.

The asparagus seems to be injured in some way other than by a fungus. The young branches have died and dried up, possibly due to a trouble below and even below ground.

#### Enriching the Lawn.

Would it be desirable to put a couple of inches very rich garden loam on top of the lawn after mowing it off very close? Will the grass come out nicely and evenly next spring without having any new seed, and would it be correct to mix some fertilizer with the soil before putting it on?—W. J. S.

—To renovate lawns it is not sufficient to add a coating of rich loam. The proper method is to spade it up and work the manure and soil in together. A light sprinkling of soil may be allowed and would probably do good. But two inches would be sufficient to kill the turf, and more than that an unequal surface would be created and weeds only would be the result. The present is a good time to break up the ground and seed may be sown at once or left until the soil warms up slightly in very early spring.

#### Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

## ALL ABOUT THE HOME PLOT

## POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Palms from Seed.

It was one of the busiest of women, on a large farm, one doing all the work of the house, and having the merest odds and ends of time to devote to flowers, who proudly showed her potted palms. "What? not from seed!" exclaimed the visitor in amazement. "Yes; raised from seed by my inexperienced self, and five plants from one packet." "That's wonderful success. How did you manage them?" queried the friend. "Very much like ordinary plants, except that I gave more heat at the first. The seed-boxes stood on the wood-box, behind the stove for weeks before the seeds germinated. And for months the plantlets were but slender green shafts, which grew later, to be sure, but seemed to have no intention of becoming anything different. At last, however, when I was sure my patience was at an end, the leaves began to spread, and now, as you see, I can really claim success. The plants vary much in size, but this largest one is worth a dollar and a half, at least. Brought through two winters by a 'chunk' stove, too!"

## Cannas for Winter.

Probably there are no plants both "decorative" and blossoming, which will grow throughout the year better than some of the Cannas. Roots which are removed to large boxes from the garden will throw up new canes and bloom well in winter, if treated to heat and moisture to suit their needs. The Canna grows wild in our Southern marshes, and because it can bear much water, it is not so likely to be ruined by the novice as are many other plants. Flamingo is a brilliant, well shaped, red sort especially recommended for window blooming. A fault which it sometimes shows of blistering in leaf, renders it less satisfactory than it might otherwise be. If this can be averted, the plant is almost ideal for the window.

## A New Cyperus.

Not wholly new, but at least a variation in form is the Cyperus with leaf segments much narrower than those of the well-known house plant. Slenderness nearly always adds grace, and is to be welcomed. "Nile grass" is an attractive, common name which for the Cyperus rivals that of "Umbrella plant."

## Lifting Plants.

Generally speaking, it is a mistake to leave such house plants as are to be lifted, late in the ground. If placed now in the winter pots, they can still have fresh air outside for some weeks, while becoming reconciled to restricted root quarters. Plants which have had bedding privileges are not, however, much prone to early bloom. If plunged and ripening, it is often best to remove them to house quarters before the continuous fall rains, as these may push the plants into growth too soon.

## Geranium, Madame Bruant.

This fancy flowered sort is sometimes described as "aureole-flowered," and is called entirely distinct from any other variety now in cultivation. "Distinct," as applied to a flower, means that it has some characteristic of leaf, or habit of growth, or form of flower, or style of coloring different from known sorts. It need differ *distinctly* in but a single point to be "distinct." It is the color arrangement, the carmine-veined center with heavy and regular silver border which distinguishes Madame Bruant.

## "Shades of White."

This odd expression catches the eye as it ranges a descriptive page allotted to Roses. The sixteen varieties found under this heading are described variously as: White, pure white, pure snow-white, creamy white, salmon-white, white, tinged lilac, white, shaded lemon, white, shaded flesh, light flesh, delicate flesh. It is by no means a bad thing for the customer to find the many sorts of Tea

Roses grouped under color. But "shades of white" seems amusing, if instructive.

## Pelliconia Pulchra.

Thus was named a specimen plant, taking first prize at a late state fair. Those who are fond of vines, and equally fond of variegation may find both tastes satisfied in this heavily-netted trailer, with its shades of pink, red, violet, and silver in the nearly oval, velvet leaves. A light soil and plenty of heat and moisture are the requirements of the plant. It is offered at retail in an occasional popular catalogue, but may need too much heat and moisture in the air to prove a good plant for the average retail buyer. Doubtless here and there one might succeed with it.

## To Build, or to Repair.

Last week I held some conversation with a farmer who numbers his hens by the hundred, yet cannot get winter eggs in any adequate numbers. He feels that if he had a good, modern hen-house, his fortune would be made, and is about decided to build one during the present autumn. He possesses already several old but good-sized poultry shelters which need only good scratching-shed attachments to render them profitable, and, best of all, more than 100 feet in length of fine, barn cellar that might be utilized for the fowls, in greater or less degree. Is it not the height of foolishness for one so situated to put up entire new buildings, which at the best, can give him only the counterpart of his great, barn cellars? A new house built to one's ideal is a delightful thing, but it is also a drain on the purse. Can any farmer afford such drain, in these days, unless better justified by the facts?

## Immediate Income from Poultry.

An exchange wisely says that the first question with the average beginner with poultry relates to the source of immediate income. Eggs for market are named as the surest and steadiest source of this, and the inexperienced worker is advised to depend for the first year solely and for several years mainly on eggs, leaving large rearing for broilers and market carcasses generally until he is fully established. In this direction lies the least risk, and therefore the least chance of failure and discouragement.

## Present Range of Prices in Eggs.

An authoritative report of prices of eggs in Boston markets at the middle of August gave 10c. as the lowest for the poorer grades. This was for Western stock. Fresh Eastern were reported as in demand at 14@15c. But above the "fresh" is still another grade, given thus: "Fancy, near-by henry (if reliable) are worth up to 20c." We need more information as to these 20c. eggs. What constitutes "henry" eggs? Is it not their supposed reliability, and that alone, that gives them an added 50 per cent. of value over poor Westerns? If there is a doubt as to this quality, what is the grading worth to the buyer?

## Prize-winning Brown Leghorns and Others.

At the last New York show of poultry one anxious to learn, asked a winner why his birds had taken precedence of those receiving the second prize. He was unable to tell, but opined that it was mainly because of dark shafting in the feathers. "It depends a great deal upon the judge," said he. This statement is one in which all exhibitors will acquiesce. A

## A Vain Search.

## SEVERAL YEARS AND THOUSANDS OF DOLLARS EXPENDED.

## An Expert Accountant and Bookkeeper of Detroit Troubled with Hereditary Scrofula in its Worst Form—Spends a Small Fortune Seeking to Find a Cure.

From the Evening News, Detroit, Mich.

James H. Wallace, the well-known expert accountant and bookkeeper, of Detroit, Mich., lately had a remarkable experience, and a reporter called at his pretty home, 240 Sixth street, to interview him regarding it. He found Mrs. Wallace in the midst of house cleaning, and after the reporter stated the object of his visit Mrs. Wallace said: "You had better see Mr. Wallace at the office of C. A. Haberkorn & Co., table manufactory, on Orchard street, and he will tell you of this experience much better than I." A visit was made to the office of the above concern where Mr. Wallace was seen. "I am," said Mr. Wallace, "yet a young man, still I have suffered untold agonies and tortures. I was born with that awful hereditary disease known as scrofula, and what I suffered cannot be well described.

"The first physicians that treated me said it was a constitutional blood disorder and by constant treatment and diet it might be cured. The blood purifiers and spring remedies I used only made the eruptions more aggressive and painful. In 1888 I was a fearful looking sight and was in fact repulsive. On my limbs were large ulcers which were very painful, and from which there was a continual discharge. In three years I spent over \$3,000 in medicine and medical services and grew worse instead of better. I tried the medical baths, and in 1893 went to Medicine Lake, Washington, but was not benefited. I then tried some proprietary medicine, but did not receive any benefit.

"One day in the fall of 1895 while reading the paper I noticed an article about Dr. Williams' Pink Pills for Pale People, but did not give it much attention. That afternoon while moving some books I broke an ulcer on my leg and nearly fainted, the pain made me sick and I had

to stop work. While sitting in the chair I again noticed the Dr. Williams' Pink Pills article in the newspaper which was lying on the floor. I read it carefully and immediately decided to give the pills a trial, as the account which I read had been of a case similar to mine. I sent the office boy over to Frank Houpp's drug store for a box and took some that afternoon. I continued their use and before I had used one box I noticed an improvement. I grew better rapidly and all my friends noticed the improvement, and after taking eight boxes there was not a sore on my person.

"I am covered with scars from the ulcers, but since that time I have not seen a single indication of the old trouble. I continued the use of the pills long after I was cured as I wanted to get my system rid of that awful disease.

"If I only had bought Dr. Williams' Pink Pills for Pale People at the start I would be thousands of dollars ahead and had five years of health and happiness instead of torture. To-day I feel like a perfect man and my doctor says I am entirely rid of my old trouble."

(Signed) JAMES H. WALLACE.  
Detroit, Mich., May 7, 1897.

Before me a Notary Public in and for Wayne County, Michigan, personally appeared James H. Wallace, who being duly sworn, deposed and said that he had read the foregoing statement and that the same was true.

ROBERT E. HULL, JR.,  
Notary Public, Wayne County, Mich.

Dr. Williams' Pink Pills for Pale People are sold by all dealers, or will be sent post paid on receipt of price, 50 cents a box or six boxes for \$2.50 (they are never sold in bulk or by the 100), by addressing Dr. Williams' Medicine Co., Schenectady, N. Y.

recent article on Brown Leghorns charges that the brown Leghorn females have been judged for years largely by the judge's fancy. If a black stripe in the hackle—which the standard requires—is not a black stripe, as the judges say, unless the feather shafts are also black, judge and standard are too far apart. The standard is the judge's dictionary, whereby he is to define every point. Now, with the revision of the standard so near at hand, it is a burning question as to which shall be revised the most, the judges or the standard. As the judges are proverbially cranky, apparently the change must come in the standard, the more especially as about this time every breeder seems to be constituting himself a judge.

#### Crossing Fowls.

"I could never understand," says one, "the motive which any one who has once kept thoroughbred poultry should have, in attempting to cross with another breed." Reference is made, further, to the "superstition" that half-breeds are more prolific in eggs, with the affirmation that years of experience have led the writer of the note to doubt the superior value of half-bred fowls. Strange that one man's experience should so contradict that of the great majority! Were it not for the added vigor which out-breeding gives, we believe this man's position might be tenable. But we find, usually, that the more experience breeders have, the more strongly do they lean toward a belief in vigor above all else.

MYRA V. NORRIS.

#### Pollination of Plums.

At the recent meeting of the American Pomological Society at Columbus, O., a paper prepared by Professor Waugh of the Vermont Experiment Station, giving his results in testing the ability of certain varieties of plums to fertilize their own flowers was read. He stated that many of the native varieties of plums were so unfruitful that they could not be profitably grown and the difficulty was that they could not fertilize the ovaries of their own flowers, although their pollen might be potent when applied to the pistils of other varieties.

The experiments reported were tried in the Kerr orchards at Milford, Delaware. The blossoms of a number of varieties were covered with paper sacks, thus keeping from them the pollen of other sorts and yet permitting self-fecundation. In the case of De Soto, one hundred clusters covered with the sacks gave no fruit at all, while the uncovered flowers that could be cross-fertilized gave a moderate crop. The Minnesota and Minnesota seedlings 1, 2, and 3 gave but twenty fruits from 380 sacks, while the uncovered trees gave in two cases moderate and in two others full crops. Pottawatomie from 20 covered flowers gave no fruits, although the tree bore a light crop. In 1896 from over 6000 sacks, only five fruits set.

The experiment covered many Japanese varieties as well as a number of native species. Of the American varieties Robinson is about the only one that is self-fertile.

In order, therefore, to grow successfully the American varieties of plums, trees of different varieties should be placed in close proximity, and care must be taken that they are such as blossom at about the same time.

Mr. Harrison, of Ohio, criticised the experiment as unfair, the flowers that were covered being deprived of the assistance of the bees to bring pollen to them.

Mr. Goodman, of Missouri, considered the experiment was of no value, as the covered flowers were growing under unnatural conditions, and it was unfair to compare the results obtained from them, with those secured when the blossoms were uncovered, while the latter would also have the benefit of insects and wind to scatter the pollen.

The Westchester County Horticulture Society will make an exhibit of plants and cut flowers at the County Fair to be held on September 27 to October 2, at White Plains, N. Y.

# Potash.

to stock means a "scrubby" animal.

HEADQUARTERS FOR ALL PRINTED SUPPLIES

# WHOLESALE MARKETS.

## New York.

The cut flower trade shows no improvement, roses are arriving in enormous quantities and realize but small sums per 100 varying from 25c. to \$2, and will not average for high and low grade together more than \$1.25 per 100.

Violets have made their appearance since August 21, but there is little or no demand for them.

The fruit and vegetable market is in a very much better condition than was reported in our last issue. A better tone exists, and the market cleans up more quickly.

Hothouse grapes are in poor demand and price is low. Outdoor grapes are coming in but the market is hardly ready for them.

Plums are in better demand and prices are higher and firmer. Pears are improving slightly for good quality.

Apples are poor and cheap; with this crop there is just now an interesting fight between dealers and growers; the last-named are holding back for higher prices on the grounds that the crop is short, while the dealers contend that there is plenty of good fruit, that several states have a full crop, and therefore there is no reason for any advance or guarantee of stiff prices; and further it is claimed that the growers are asking more than the selling price in this city. A slump is predicted later. So far with sound stock the grower has the best of the argument and \$2 is being held for by many.

Apples—Duchess of Oldenburg, hand-picked, d.-h. barrel, \$2@2.50; Gravenstein, hand-picked, per d.-h. barrel, \$1.75@2.50; Holland Pippin, hand-picked, per d.-h. barrel, \$1.50@2; Fall Pippin, hand-picked, per d.-h. barrel, \$1.50@2; Twenty-Ounce, hand-picked, per d.-h. barrel, \$1.50@2; Blush, hand-picked, per d.-h. barrel, \$1.75@2.25; King, hand-picked, per d.-h. barrel, \$2@2.25; Greenings, hand-picked, per d.-h. barrel, \$1.25@1.75; Baldwin, hand-picked, per d.-h. barrel, \$1.25@1.75; mixed varieties, fair to good, per barrel, \$1.25@1.50; poor to fair, per barrel, 60c.@\$1; Virginia, selected, red, choice, per barrel, \$1.50@2; mixed kinds, ordinary, per barrel, 60c.@\$1; Jersey, winter, open heads, 75c.@\$1; crab apples, small, choice, per barrel, \$2@3; large, per barrel, \$1.50@2.

Onions—Jersey, white, per barrel, \$1.50@2; Jersey, other kinds, per barrel, \$1@2; Orange Co., red, prime, per bag, \$1.25@1.75; Orange Co., yellow, per bag, \$1.25@1.50; Orange Co., white, per bag, \$1.25@2; Orange Co., inferior, per bag, 40c.@\$1; Long Island, yellow, per barrel, \$1.50@1.75; State and Pennsylvania, yellow, per barrel, \$1.50@1.75;

Ohio, yellow, per barrel, \$1@1.50—eastern, white, per barrel, \$2@3; eastern red, per barrel, \$1.75@2; eastern, yellow, per barrel, \$1.75@2; small, white, per barrel, \$2@3.50.

Peppers—Jersey, per barrel, 75c.@\$1. Squash—Hubbard, per barrel, 75c.@\$1; Marrow, per barrel crate, 60@75c.

Tomatoes—Choice, round kinds, per box, 75c.@\$1; ordinary, per box, 50@60c.

Turnips—Russia, local, per barrel, 50@75c.; Russia, Canada, per barrel, 75@80c.

Potatoes—Long Island, in bulk, per barrel, \$2.25@2.50; Jersey, per bag, bag included, \$2@2.25; choice round, in bulk, per barrel, \$2.25; average prime, in bulk, per barrel, \$2@2.12; poor to fair, in bulk, per barrel, \$1.75@1.87; Albany and Troy, in bulk, per barrel, \$1.50@2; Western New York, per 180 pounds, \$1.75@2.25; Sweet potatoes, South Jersey, per d.-h. barrel, \$2@2.25; yellow sweets, Virginia, per barrel, \$1.25@1.50.

## Boston.

Michigan has broken out with a carload of those fancy Gem melons which last year gave excellent satisfaction. Another car of the Rocky Fords expected this week, and will be placed at not less than \$3 per bushel crate.

Green corn very firm; the common table varieties selling 12@18c. per dozen; there has been introduced this season a special corn called Craig's favorite. It is very sweet and tender and all receipts are taken each morning by our first-class hotels and some of the fancy restaurants. It easily brings 30c. a dozen, or about twice that of the generally accepted varieties. Said to be the finest ever produced for table use.

Rhode Island cantaloupes are getting towards their end. The only variety appearing this morning being the Black Jap which brings \$2.50@3 per barrel.

Watermelons are so near their end that no comments need be made.

Choice tomatoes are in quick demand at 85c.@\$1.25 per bushel, while the common grades find very good sale at about 50c.

Sales are slow on egg plant, as well as for peppers; celery a little firmer at 75c.@\$1 a dozen.

Onions are easier, large barrels \$2; Ohio barrels \$1.75.

Marrow squash unchanged \$1@1.25 a barrel.

Artichokes \$1.50 a bushel.

String beans for pickling \$1 a bushel; limited demand for table use; shell beans take range of \$1.50@2.50 a bushel according to variety.

Mint 40c. dozen bunches; lettuce 10@15c. a dozen; parsley 50c. a bushel.

NOW READY.

# The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DE LA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8 Duane Street, P. O. Box 1697, New York City.

Cabbage continues to move at 8@5c. a head; cauliflower steady.

Carrots \$1@1.25 a bushel; beets or turnips 50c. a bushel.

Potatoes are practically unchanged, no large receipts coming; to name figures should say 75@90c. a bushel; while if in barrels \$2.25@2.75. Sweet potatoes in good demand \$1.60@1.75.

Bartlett pears have doubled in price since last week; some fancy home-grown stock \$2 a bushel.

Near-by peaches take a range from \$1 to \$1.50, according to how fancy they are. Connecticut stock takes about the same range; a car of fancy Michigans placed \$1.50@1.75 in six-basket carriers; Cumberland Valley stock very poor; scarcely brought freight; New Jersey stock 40@80c. a basket.

This city has just commenced on hot-house cucumbers, the first being put out on Monday morning at 4@5c. each; the small field stock for pickling \$2.50@4 a bushel.

Delaware grapes, pony baskets, 12@13c.; Concord 9@10c.

Plums are not as plenty, consequently little firmer prices; Damsons in 10-pound baskets 30@40c.; other blue varieties 25@35c.; with Greengage in as good demand 30@35c.

Apples continue to advance; receipts being very light, and some choice New York state Twenty-Ounce \$2.25@2.50, while some Kings, highly colored, brought \$2.75; Missouri stock is in better condition, and common green or light red cooking varieties \$1.75@2, with fancy eating like the Jonathans at \$2.25@2.75.

There is no demand whatever for green peas, and weather has been so cold that the later yieldings have not been tender; it probably took them too long to grow.

The crop of onions in the Connecticut valley will not be over two-thirds that of last year.

### Philadelphia.

The general market has been good; receipts of peaches have been moderate and the market is firm with a good demand. Pears are in fair supply and demand, at former prices. Receipts of watermelons are showing better quality, and the demand for best stock is good. Receipts of plums have fallen off; prices are firmer with good demand for good stock. Grapes are in fair supply, demand light. A few cranberries are seen, but the demand is light.

Apples—Maldens' Blush, per barrel, choice, \$2.50@3; Duchess of Oldenburg, choice, per barrel, \$2.75@3; mixed varieties, per barrel, choice, \$1.75@2.25; fair to good \$1@1.50.

Peaches—Mountain fruit, choice, per basket, 75@90c.; fair to good, 40@60c. Jersey fruit, choice, per basket, 50@60c.; fair, 30@40c.; culls, 15@20c.

Pears—Bartlett, per barrel, \$1.75@2.50; per basket, 40@60c.; cooking, per basket, 15@25c.

Plums—(N. Y., per 8 to 10 pound basket) damsons, 20@25c.; Washington, 20@25c.; Rene Claude, 20@25c.; Quack-eboss, 20@25c.; common blue, 12@18c.

Grapes—Hudson River, per 20-pound case, 30@50c.; N. Y. Concord, per 8-pound basket, 8@10c.; N. Y., Delaware, per 8-pound basket, 12@14c.

Cranberries—Cape Cod, per barrel, \$4@5.

Watermelons—Extra, per 100, \$12@15; fair to good, \$8@10; culls, \$4@5.

Muskmelons—Jenny Lind, per barrel, 75c.@\$1.25; Jersey, Gem, per barrel, 60c.@\$1; Maryland and Delaware, per bushel basket, 40@50c.

Beets—Local, per 100, \$1@1.50.

Celery—Choice, per dozen, 25@40c.; fair, 12@20c.

Corn—Per 100, Jersey, 60@80c.; Pennsylvania, 75c.@\$1.25.

Cabbages—Jersey, per 100, \$2@3.50. Cucumbers—Jersey, per 100, 60c.@1.25, pickling, per 1,000, \$1.50@2.

Egg plants—Jersey, per barrel, 75c.@\$1. Lima beans—Per 100 pounds, \$2@2.50.

Green peas—Marrows, choice, per bushel, \$1.25@1.40; fair, per bushel, 80c.@\$1.

Onions—Jersey, white, per barrel, \$1.50

## HOT BED SASH AND GLASS

@1.75; Jersey, yellow, \$1.80@1.50; per barrel, 50@60c.

Peppers—Jersey, per barrel, 45@60c. Squash—Hubbard, per barrel, \$1@1.80.

Tomatoes—Choice, per basket, 40@60c.; fair, 25@30c.

Receipts of potatoes are on the increase, and sales have been mostly on bushel basis at 45@60c.; per basket, 30@40c. Jersey sweets, 25@30c.

### Cost of Growing Corn.

This subject has been lately investigated by the American Agriculturist, the figures being collected from various growers.

The result of this investigation shows the actual cost of growing 118,049 bushels of corn on 2,632 acres to have been as follows:

	Per acre.	Per bus.
Taxation.....	\$0.278	\$0.006
Removing stalks.....	.081	.001
Plowing, har'ng and plant- ing.....	.549	.018
Seed Corn.....	.064	.002
Cultivation.....	.589	.018
Gathering and cribbing.....	1.126	.026
Total from actual records.....	2.607	.061
Est. team maintenance.....	.814	.007
Est. depreciation machinery.....	.266	.006

Gross cost.....\$3.187 \$0.74  
Less value of fodder......584 .014  
Net cost..... 2.603 .060

That corn can be grown at a cost of 6 cents a bushel will be a surprise to the best posted, yet these exact records, kept by growers themselves, prove it. If it be desired to add interest on money invested, which, however, is not a part of the actual cost of the crop, the average value of the land used in making this crop was \$39.16, and to this must be added a proper allowance for the equipment of the farm. The selling price of this corn crop must be not less than 18 cents in order to give the producer a net profit of 6 per cent. upon the capital which his thrift has accumulated.

### Deafness Cannot be Cured

by local applications, as they cannot reach the diseased portion of the ear. There is only one way to cure Deafness, and that is by constitutional remedies. Deafness is caused by an inflamed condition of the mucous lining of the Eustachian Tube. When this tube gets inflamed you have a rumbling sound or imperfect hearing, and when it is entirely closed Deafness is the result, and unless the inflammation can be taken out and this tube restored to its normal condition, hearing will be destroyed forever; nine cases out of ten are caused by catarrh, which is nothing but an inflamed condition of the mucous surfaces.

We will give One Hundred Dollars for any case of Deafness (caused by catarrh) that cannot be cured by Hall's Catarrh Cure. Send for circulars, free.

WANTED a place; I can with confidence recommend my gardener to any lady or gentleman in want of such; he is in all trustworthy and a good gardener who knows his business. J. K. Larren, Box 93, Marion, Mass.

MARRIED man desires situation in private or commercial place. Understands all green-house plants, and has made a specialty of chrysanthemums. Best of references. John Dyer, Short Hills, New Jersey.

# THE HENRY

## The Most Wonderful Strawberry of the Age.

**M**ESSRS. STEVENS, SIMPSON & CO., Commission Merchants, 232 West Street, New York City, state they handle the HENRY Strawberry, and have realized for it the highest price obtainable for any outdoor stock coming into New York market. Mr. Simpson further states that, in his opinion, as grown, packed and shipped by Mr. Henry Jerolaman, it is the BEST HOME MARKET BERRY in existence. For SIZE, COLOR, and SWEETNESS, and, in its KEEPING QUALITIES, IT HAS NO EQUAL; these many points in its favor rendering it easy for the grower to realize considerably more per quart than the regular market value of Strawberries generally.

**M**R. JEROLAMAN says, and his statement is corroborated by those who have seen the fruit: The HENRY is beyond all doubt not only the strongest plant, but the largest, best, hardiest and sweetest Strawberry ever yet produced; color, dark crimson; it is perfect (staminate), very large, round, and no coxcombs grow on it. . . . It will out-produce any Strawberry plants that I have ever known, four-year old plants giving very large and just as fine berries as plants one year old. . . . The plants as yet have shown no disease. . . . It is the first berry ripe and the last.

# YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

THROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessed of the story of the life and cultural methods of Henry Jerolaman, undoubtedly the **STRAWBERRY KING OF THE UNITED STATES**. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us **One hundred thousand plants of the HENRY STRAWBERRY**, to be used solely as premiums to subscribers to AMERICAN GARDENING. The Henry Strawberry has positively never before been advertised.

THE CONTRACT

*Publishers American Gardening.*

*Gentlemen,*

*I hereby agree to furnish you within the next twelve months in quantities as ordered. One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold.*

*Witness*  
*Thos. L. Bolting.*

*(Signed)*  
*Henry Jerolaman.*

### The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

### A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one strawberry grower in every town, village, and hamlet can come into a good thing through practising the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

### Taking Advantage of Our Offer:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid.

## FIVE PLANTS ..Of the.. Unequaled HENRY STRAWDERRY

And AMERICAN GARDENING One Year.

Present Subscribers are entitled to this Offer on renewal; if their subscription has not expired, it will be dated ahead.

Plants to be shipped this Fall or in the Spring, as you prefer.

### OFFER EXTRAORDINARY

For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, Five Plants of HENRY STRAWBERRY; at the same time we will also send Five Plants to the party subscribing through you. Thus a club of 10 new subscribers entitles you to 50 plants of this wonderful Strawberry, as well as each individual subscriber to 5 Plants. This is a BIG OFFER to all who want to become larger holders of this wonderful Berry, never before advertised. Time is short, get to work to-day.

Address **Publishers AMERICAN GARDENING, P. O. Box 1897, New York.**

For \$1.00 we will send AMERICAN GARDENING on three months' trial (13 weeks) to four separate addresses, and as a premium, **Five Henry Strawberry Plants** to the one getting up the club. **HUSTLE.**

POT YOUR PLANTS IN

FIG. 100.—ROSA MULTIFLORA USED AS A HEDGE PLANT. (See page 681.)

The above picture is reproduced from a photograph taken for AMERICAN GARDENING by Mr. P. Bisset, and shows a hedge of Rosa multiflora as seen in the gardens of Hon. Gardiner P. Hubbard, West Washington, D. C. The freedom of growth and profusion of bloom are well illustrated by the picture.

## The Village Square.

[SEE SUPPLEMENT GIVEN WITH THIS ISSUE.]

On a former occasion some of the general principles which should govern the laying out of such areas were indicated and their practical application is now set forth graphically by Mr. J. Forsyth Johnson whose explanation of the details follows:

Before entering into a discussion of the development of the square itself, let us first look to the surrounding features. It will be noticed that the corners of the adjoining blocks are shown rounded; this is a suggestion which deserves attention in all places, and is incidentally alluded to here. By following the curve as shown, there are made five or three "corner" lots according to the sweep of the curve. Experience has proved that this treatment greatly enhances the value of the lots for residential purposes—as an instance at Inman Park, Atlanta, Ga., where the ground was thus laid out these "corner" lots realized 25 per cent. above that of the other lots, although the actual area was smaller; it is the frontage and improved prospect that tell.

The important feature of the rounded corners was made because in planning building grounds on the square system the lots on the side streets are some 25 to 50 per cent. below the value of those on the main streets; the cause of this in the square setting out of street corners is that the corner house facing the main street always, more or less distinctly, has its back exposed to the side streets, and this forms a bad introduction to it. By the adoption of rounded corners as here suggested, the side streets are made nearly as desirable as the main streets. Moreover the five corner lots make a gradual transition and each successive side on the curve is but a trifle below its neighbor in importance and value.

The rounding of the corners as above leaves ample space for the four small triangular plots in the roadway; these can be utilized to very great effect and serve as a link, harmonizing the streets with the garden effect of the square. The transition is not abrupt, which effect is also materially aided if the streets be lined with shade trees as indicated. It is important that the trees used in the triangular areas be as shown, narrow, not spreading; they are not shade trees being used merely for effect, and preferably let them be evergreens—the common so-called cedars, for instance. The shade trees, it will be observed, are arranged so as not to interfere with the view from the houses, that is to say, they are planted opposite the divisional line. If the situation be in a business center, of course the buildings will be brought as near to the road as possible, but in a residential quarter the park-like area can be almost doubled by placing the houses at some distance from the road, even to 40 feet.

The trees (*Acer pseudo-platanus*) lining the streets are shown on a prepared ground. This is done merely to indicate the imperative necessity of making proper preparations for their reception—a tree to do well must have good soil, and plenty of it. Make a bed of good mellow loam, five feet wide and three feet deep. It may be well here to caution some of our improvement societies against too deep planting, for that will be fatal. The surface of the prepared soil may be used for grass, or be paved over (except five feet square right around the tree) as necessity demands.

The design is for a public square, not a private garden, and care has been taken that as such its vistas are taken from the surrounding streets. Public squares, gardens, and parks in cities should always display their beauties to the public from the streets. The banking out of these views from the public which pays for them is not to be defended on any ground whatsoever. In arranging for a private garden other considerations arise as can be seen by a reference to the plan already issued by us\*. The broken lines

drawn across the plan in various directions show some of the principal views of the square.

The entrances are placed at the corners as affording the greatest convenience here, and also providing long views, each different, and indeed, no two views are alike on the whole ground. The curves of the walks are so taken as to lead pedestrians along them, offering no excuse for their crossing the grass. Around the water and band stand ample provision is made to accommodate those who come to linger, the promenade is wide, and offers many opportunities for the artistic placing of seats. It will be observed that no large trees are to be planted on the island devoted to the band; this is because their presence is destructive to the best results from the efforts of the musicians. The piece of water is of necessity small, therefore no large growing weeping trees are to be used around it, and the surface of the water should be but two inches below the level of the walk, the margin being kept at the level of the walk except where plants on rockery are shown. The raising of a bank around a Lily pond or any ornamental water is against all principles of natural and artistic effects; the water should appear as part of the ground.

The walks are lined with shade trees—Linden, Beech, or Maple—one walk to one tree; thus we will have the Beech walk, the lime walk, etc., using heavy shade trees inside the area and on the surrounding streets the English Sycamore is suitable, or in a smoky atmosphere the Plane.

As regards the other plantings shown, there is scope for much individual taste, but care is advised that the balance between high and low-growing subjects be maintained as is shown in the plan. Our present suggestions are general, not detailed; any special information on that may be had by a reference to the previously issued plan alluded to above. *Hydrangea paniculata* is a valuable shrub and opportunity for its use is frequent. For evergreen effect some of the beds should be planted to Box or Yew, and others again to *Rhododendrons*, taking care to make each subject a distinctive feature and not mixing them all up together in a confused mass. Aim to give local features in the planting. Use *Deutzia crenulata* in some beds, and where they are in a shaded location the *Loniceras* will give satisfaction.

Care should be exercised to secure perpetual effect, thus, for instance, a bed of *Deutzia crenulata* would have a weak appearance in the fall, and some rough growing autumn flowering perennial such as *Hellianthus Maximilianus* should be introduced to bridge over the otherwise dull time. In this connection we would also add emphatically that every border or bed in any grounds should spring into life with the first flush of spring's warmth, which end is best obtained by planting near to the margins, so as not to interfere with the characteristics, the hardy permanent bulbs—Snowdrops, Scillas, etc. In the shrubberies fair masses of *Narcissus* give very valuable effects. It is imperative that a public garden should present a pleasing appearance at any and all seasons of the year; thus the evergreens are to be placed so that they have their special effects in the winter season and act as a frame to the colors lent by the blossoms of other plants in their particular seasons. The art of landscape gardening is to have a reason for the placing of every individual plant.

When we approach the beds in the vicinity of the water the effect of latter may be enhanced by a gradation as it were of the vegetation which surrounds it; for this purpose the plants to be put on the beds in the grass area should be *Arundo donax*, *Eulalia gracillima*, and such like, and the beds on the promenade itself it is suggested to plant with *Cannas* or some such subject each season.

It will be observed that no formal bedding has been arranged for; this is on account of economy, but should such be desired the grass about the pavilion affords ample and suitable space for such work; and it may here be added that Lilies can very effectively be planted in the shrubberies in all parts of the square. The

large bed on the side opposite to the pavilion should be planted so as to have a center height of fifteen feet. *Euonymus alatus* would be effective so used its red leaf in the fall and its bright berries would give a welcome show of color.

In order to get an "established" effect as quickly as possible it is always desirable to use a number of quick growing, cheap plants which are to act as nurses to the permanent subjects, and which are to be cut out and destroyed as becomes necessary. For this purpose the Willows and *Populus monilifera* are well adapted and a variety of color can be had very easily by the use of Castor Bean, tall Sunflowers and such like for the first year or two.

## Chrysanthemums.

The Temperature must be watched now, for a cold night may cause lots of trouble. We are not in sympathy with the idea of keeping the plants so cool; it is ruinous to crown buds, and many are annually spoiled in consequence. The conditions governing a crown bud seem to differ materially from those which are best for a terminal. The petals are packed in hard and close, and must have heat, or they will never free themselves, and the center will remain in a hard lump, making what is often called a bad eye. Our houses never run below 50 degrees, and range from that upward for six or seven degrees. A little heat makes the atmosphere dry and buoyant and in this temperature the crown bud will develop into a magnificent deep flower.

Incurved Varieties are some of them improved a good deal if a few of the petals are removed from the center. It is not perhaps absolutely necessary, but I have noticed that Mrs. Twombly makes a higher built flower if some of the petals are taken out so as to give the others more room.

Reflexed Varieties, when crown buds are taken, need more feeding than for the terminal buds, or they lack depth and substance, and all one may get out of them will be a few rows of very long petals and nothing to speak of in the center.

Feeding Tells More now when the buds are swelling than at any other time, and applications of fertilizer can be given often and strong, remembering that pot plants should get the most, as they have so much more to maintain in proportion to the soil they have to grow in, the little six-inch pots most of all. Feeding can be kept up till the flower is half way developed, but if kept on too long the petals will damp, pink and brown kinds being the quickest to show this failing, while Mrs. Robinson will stand feeding, when, judging by other kinds, it is pretty well developed. It makes a very deep flower, and it is wonderful to note its improvement day by day.

Early Varieties like *Marquis De Montmort* and *Merry Monarch* are on the market by this time, but the season hardly seems to begin till Mrs. Robinson comes forth in her peerless beauty.

C. TOTTY, N. J.

## An Ornamental Bed Wanted.

An ornamental bed on the lawn in view of the parlor windows is desired. Perennial plants and those which will bloom all summer preferred. The location is shaded by high-trimmed trees in the forenoon till 10, and at two the rest of the day by the house. Circulation of air good, light good, water and fertilizers in plenty. Can you suggest plants, perennial or annual, which will thrive and bloom in situation described? How would *Spiraea Anthony Waterer* do? or *Polyantha Roses*? Tuberous Begonias not desired.—D. U. X.

—Without knowing the area of the lawn and its aspect, whether smooth or sloping, it is impossible to form an opinion. Tell us how large a bed is needed, also what the soil is. There are so many things that may be suitable we cannot advise without specific details.

\*"How to Lay out Home Grounds"; republished as a separate sheet. Post free 25c.

## The Vegetable Garden.

**Preparations for the Winter** should now be made by fixing up the cold frames, and doing any necessary repairing and providing shutters and mats to protect the contents of the frames from frost. See that storage cellars are in good condition for the reception of vegetables, as they will soon have to be all in.

**Lettuce.**—Transplant, if not already done, into cold frames, and if properly taken care of by freely ventilating and protecting from frost, lettuce can be had till February; any full-grown plants that may still remain in the garden, can, if taken up just before frost, with a good ball of roots, and placed on the bottom of a cool dry, airy cellar, be kept three or four weeks. Care should be taken to put them in when the leaves are perfectly dry. Stand them close together and they will commence at once to grow to an ivory-white color, and should be used at once, as they become very tender in the cellar.

**Celery.**—Do not be in a hurry to put this into its winter quarters, as it will withstand several degrees of frost; if it is stored away too early, and the fall should prove to be a warm one, it will very quickly rot. It is usually safe to let it remain where growing until November 1 or later, according to the latitude and the weather prevailing.

**Squash** should now be all ripe and ready to store away in a dry airy place. A good place to keep them in until frost is in the corn-crib, or in open shed, where they are sheltered from rain. They should not be allowed to remain where they are liable to freeze, or they will not keep long.

**Egg Plants.**—Ours have, for the past year or two, both here and in Rhode Island, been quite subject to a peculiar attack of some unknown disease that destroys the vitality of the plant, the leaves become yellow, then brown, and shrivel up and die. I am unable to find any insects or distinguish any blight of any sort, and any reader who has noticed any disease upon these plants, or can suggest a remedy, will confer a favor by communicating. I have tried every remedy, but apparently with no result.

**Asparagus Beds.**—Now is a good time to make new beds wherever needed. Before any permanent plantings are made, the ground should be well enriched with manure and bone dust, deeply plowed and cultivated. If beds are properly prepared, they will be in good condition when twenty years old.

W. M. EDWARDS, Conn.

## Tomato Blight.

(To A. A., Kas.)—The specimens of tomato leaves have been examined, and prove to be affected with the Tomato Blight that has prevailed throughout the country for the present year. The fungus (*Septoria lycopersici*) causing the trouble attacks the plants while they are small, even in the plant bed before setting in the field. While young the plants lose their lower leaves, but soon the stems become affected and show the presence of the fungus in innumerable small dark specks. After these stem-spots appear the whole plant ceases its growth, and losing its foliage, falls to the ground and matures little or no fruit.

The cause is well-established and the remedy may satisfactorily follow. Large growers of tomato plants, who have been troubled, may well use every precaution to clear their beds by the use of fungicides upon the woodwork, and the use of soil obtained from a place where tomatoes have not been grown. It might be still better to build new beds in a new place, and thus move away from the infection.

After the plants are well up, they should be sprayed from time to time, and the same treatment continued in the field. In our experiments with spraying tomatoes the present season, this and all other tomato blights have been kept down by the use of Bordeaux, the spraying being at intervals of ten days. The

cost is but a trifle, and while the sprayed plants are still green and in bloom, those in adjoining fields where no treatment was given have long been practically dead.—B. D. H.

## Successful Tomato Culture.

Herewith I hand you a photograph of tomatoes growing in my garden in a suburb of Pittsburgh. They are of the Beefsteak variety, transplanted into ground fertilized with manure from cowyard; on May 31 plants were 20 inches high. Following directions in AMERICAN GARDENING I laid plants down in furrow and covered 15 inches of same 4 inches deep, leaving 5 inches of top uncovered; have given them no special attention except to keep clear of weeds, keep top stirred up to conserve moisture and tie up to trellis of plasterers' lath.

They now (September 6th) measure 6½ feet long on an average; I show two plants in a row of 12, on the first are 26 immense solid tomatoes and on the second, 38. This does not include the first ripe nor the small ones and blossoms. The average for the row at present is about 30 large fruits to the plant. The photo will give you an idea of their size. The one in the quart basket on top measures 5½x4½x2 and weighs 1½ pounds, is not the very largest. The fruits are very

FIG. 191.—SUCCESSFUL TOMATO CULTURE.

solid, meaty, almost seedless and of excellent flavor. E. D. SMITH.

## A Dilatory Celery Patch.

What shall I do with my celery? I transplanted it about the 10th of July in light soil fairly rich, the ground being previously plowed; but the celery did not seem to grow. I put 200 plants on one-half an acre the beginning of September and gave some salt. There is rust present. I have cultivated once a week.—T. M.

—Ground intended for the growth of celery cannot be made too rich, it should also be of a retentive nature, and plowed deeply and thoroughly cultivated before the plants are set out. In the hot and dry months of July and August, efforts should be directed to retain the moisture in the ground by frequent cultivation, or by the use of a mulch. If this cannot be done, a good supply of water is necessary, and when the ground is dry, and any watering is done, a good soaking to a depth of at least five inches should be given; a light sprinkling to the depth of an inch or less will not reach the roots, and will evaporate quickly, without any

good results following. As soon as the top soil is dry enough after watering, cultivate thoroughly, leaving a nice mulch of dust on the surface, which retains the moisture in the soil.

On light sandy soils celery is very liable to become rusty, especially during hot, dry weather; this is caused by a fungus, and it is now too late to attempt a remedy. On its first appearance it should be sprayed with the Bordeaux mixture. This will not kill the fungus outright, but it will keep it in check and prevent it from attacking any new leaves. It is sometimes advisable to cut off the badly rusted leaves and destroy them by burning; if this is not done the spores will remain dormant all winter, ready to attack the crop again another season.

The celery being a voracious feeder, possibly suffered for want of food, and the season is now rather too far advanced for the celery to gain much benefit from an application of fertilizer, but if 100 pounds of nitrate of soda be carefully scattered between the rows (being careful not to touch the leaves with it or it will burn them), then cultivate twice by going up and down the rows, to thoroughly work it into the soil, there will be immediate effect if the soil is moist; but if the soil is not moist, the soda should first be dissolved by placing about 2½ pounds into a barrel of water. After this is applied and the weather proves favorable, the celery will grow vigorously until November 1. It is well to remember that good celery cannot be grown with fertilizers alone, it needs plenty of organic manure. Salt is sometimes used to advantage on dry sandy soils to retain moisture, otherwise it has no manurial value.—W. M. E.

## Plums in Delaware.

### Notes on Varieties.

Among the plums that have borne good crops this year here, the natives have done the best. We had no Japans of any kind. They were just out of bloom at Easter when that cold snap came, and hence they were killed entirely.

Wild Goose and Whittaker gave us good crops and paid fairly well. Newman ripening a few weeks later bore fully, but could not be sold at any price; likewise Rowlette, which is a fine plum but comes at a bad time for profit.

Pool's Pride was loaded with medium-sized light red plums, that ripen here about August 1, Wolf a little later.

Purple Yosemite was the best, I think, of the Americana type and is really a fine plum, though American Eagle and Prairie Flower were both fine.

Rachel, Reed, Moreman, Golden Beauty, Garfield, and Wayland wound up the season, but sold at no profit. Most of these are fine for family use, especially Reed, Moreman, Wayland, and Golden Beauty, but I doubt if there is any profit in them.

I have a number of new varieties on trial that have not yet fruited. We cannot grow plums of the *Prunus domestica* type here with any degree of success, hence it is best to rely on natives and Japans. Some seasons both of these give a crop; it often happens that one or the other fails, but rarely both, so one is sure of plums if he plant both kinds.

There is a point that must not be lost sight of. Don't plant Japans and natives together with the idea that one will pollinize the blooms of the other. The Japans are usually out of bloom and have young fruit as big as a shot before the natives show any bloom, hence one will not fertilize the blossom of the other.

The agent of a well-known nursery sold a man here a lot of Burbank, Abundance, and Satsuma plum trees and sold him Marrianna to pollinize them. A pretty good case of fraud, as the Marrianna is of little value commercially and no earthly use in respect of a pollinizer. Such instances are common.

CHAS. WRIGHT, Del.

The Philadelphia Times of September 11 contains a very full and interesting description of the Fordhook seed farms of W. A. Burpee & Co.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multiplicity of counsel there is wisdom and safety. Write us often.

**Our Supply of Bulbs.**—In regard to the question in AMERICAN GARDENING of September 11, I take the liberty to say a few words about the question. Having worked and traveled through France, Germany and all through Holland for different nurserymen and bulb growers, I believe I have a little experience and do not doubt but we could grow all kinds of bulbs in the United States. If any one would let me know what kind of soil he has, and the climate, I would be willing to explain my thoughts. I am also sure that L. Harrisli could be grown here very successfully. Of course it takes a little study and careful attention to find out where bulbs will thrive the best, what soil they prefer, etc., but on the other hand there is no easier thing to propagate. The stories of the foreign growers are for me of no account, for they are not growing all of their bulbs on the same soil. Holland, France, and Belgium have all different soils, and neither are their climates the same. If there is any nurseryman who wants to give it a good trial, you may give him my address. Now I hope this will be enough for the present, and shall be glad to hear from some interesting nurseryman about the matter.

Further I will say a few words about our foreign traders. I have seen packed *Rosa multiflora* for climbing Roses of all kinds. I have seen in the spring where they had many Roses, Clematis, etc., left, the names changed for them what were scarce and looked for, and shipped to the United States to be sold on public auction. I have seen transplanted Evergreens two and three years old shipped to the United States, and were never transplanted, and the same with Rhododendrons, Azeleas, etc., as with Roses, Clematis. I myself bought four years ago, when I only was a few months in this country for over \$100 worth of bulbs, and came afterwards to the conclusion that four of the most preferred kinds had been substituted.

I think AMERICAN GARDENING is more widely circulated among amateurs and others horticulturally interested than any other weekly.—XENO.

**A Little More Specific, Please!**—Nearly all the many readers of AMERICAN GARDENING are doubtless devouring with eager interest the series of articles by Mr. Jerolaman, in order to learn from his experience how to grow such mammoth strawberries as the paper assures us have been grown by him. But if his directions are to accomplish their design, it is quite important that they should be so specific as to shut out all possible misunderstanding. In his last article, (September 25) he says: "I plow in a good coat of well-rotted barnyard or stable manure, not too heavy a coat, or you will make your land too light and thus burn the strawberry roots." Now on reading this a tyro very naturally asks, How much is a "good coat of manure?" Does it mean covering the land an inch deep, or two inches or six? How soon does the coat become "too heavy," so as to endanger making the land "too light and thus burning the strawberry roots?" And again he advises that when the plants are set and start to grow, the ground for one foot each side of the row should be covered with "a good heavy coat of well-rotted manure." And again the question arises, How much is "a good heavy coat?" I once heard of one who being told that "a good coat of wood ashes" would benefit his strawberries, covered his whole bed with unleached ashes three inches deep! Surely this was "a good coat." He reasoned that if ashes are good for strawberries, then the more of them the better. It is of the utmost importance when giving

directions to be followed by others, that the statements should be so clear and so specific that no two readers can get different impressions from them.—W. H. W.

**Columbian Raspberry.**—I want to tell you a little of my experience with the Columbian raspberry and perhaps get through your columns from some one who has had experience some advice.

Two years ago this last spring I bought one plant and set it in a moderately rich place in my garden. The growth that summer was something little short of marvelous; it had only a few berries, but enough for me to know what they were going to be, and I was very much pleased with them. In the fall I covered the tips and this spring got six good plants which I set out with about same results as to growth, and now I have six—well, I will call them small trees, with their branches trailing on the ground. I want to know the best thing to do with them as to pruning, etc. I would say further that this variety has proved to be very hardy and satisfactory in every way unless it is that it grows too strong.—FRANK C. DOWD.

**Is It Hardy?**—I would like to know through your valuable paper if the raspberry Cuthbert is perfectly hardy for northern Illinois and if you can over-winter them safely without protection?—C. G.

**An Answer Wanted.**—How should crops be rotated so as to get the most off of land. Assuming that the season is of average length, and that the land is located near a good market? Is it better to plant early crops and remove them, plowing and replanting the land, or to plant in alternate rows the early and late crops?—G.

**Cupid Sweet Peas.**—Referring to your recent remarks I would say I had a couple of large vases in my front doorway, which, as they stood, were most barren and unsightly objects. The bowls were shallow, and I had little hope of making anything live in them, especially as they stood under Pine trees. I, however, put in what little earth I could and planted Burpee's Cupid Sweet Peas and a few Pansies. The effect has been a most agreeable surprise. The Peas have bloomed feely all summer, and have accorded beautifully with the white vases, while the Pansies have lent a tinge of color most delightful under the dark foliage of the pines. Cupid is certainly an acquisition among our decorative flowers, if it is properly planted and cultivated.—J. H. GRIFFITH, N. Y.

**Poison Plants.**—There is yet another poisonous shrub that resembles the Ivy in its effects; it is the Poison Sumach, growing principally in swampy places. Mr. Stratton is evidently easily affected by the poison. If he will prepare a saturated solution of bluestone and bathe with it he will find a sure remedy. At first it is but a surface trouble, but if allowed to extend, it soon affects the blood and in some cases causes death. It always renders a person more and more susceptible to its effects after each attack. Hard and thick skin is not a safeguard, as I know from experience, having had the "blisters" under the soles of my feet after having penetrated through a leather boot. Yet in my younger days I could handle it with impunity. I am the reverse of Mr. Stratton, yet I am just as easily affected by it at the present time. Recipe: Take bluestone in a stoneware vessel and pour boiling water on it, so that some of the bluestone will remain undissolved; when cold keep in a bottle, scratch the blisters open and bathe. The second application usually cures.—HENRY SNYDER, Md.

A good mixture for painting on the trunks of trees for the purpose of clearing out fungus and insect enemies is made by adding a little flowers of sulphur to, say, about a teaspoonful to a bucketful of white-wash. A small quantity of Bordeaux added will darken the whole.

Poe's Park is now under way. The New York Park Department has adopted plans for the work. Ten thousand dollars are to be spent on the park around the old home of the famous author.

## Roses Under Glass.

I have been asked several times if the small black spots, about the size of a pin-head, sometimes seen on the Gontier, were identical with the well-known spot; also its cause and cure. This is not what is known as black spot of the rose, but is the white powdery mildew in a disguised form, and is superinduced by excessive moisture and an insufficient circulation of air; so conditions the reverse of these should be resorted to for its cure. It is not very dangerous, but has a tendency, in bad cases, to induce the green foliage to fall, which is a well-known habit of this variety.

In regard to mildew it is most advisable now, even though none be seen, to prevent its putting in an appearance, by painting every here and there on the heating pipes some sulphur and lime mixed together, half and half, to the consistency of cream. It should not be put on too strong—just enough being applied so that the fumes are perceptible.

It is a very good policy to observe cleanliness in the houses at all times by keeping all dead leaves picked up, and having all other rubbish that may accumulate both on top and under the benches removed.

Don't on any account neglect keeping the plants tied up properly; it will be found that lots of work and time are needed in this direction, as during this month the plants most generally make their best and most rapid growth of the season.

You are all doubtless aware that light is one of the most important factors for the production of fine roses, so if you have not already cleaned your glass on the under side, the work should be done on the first favorable opportunity. I always select a bright day for this purpose, as in the course of the operation some water falls on the foliage. There is always more or less matter on the under side of the glass that obscures considerable light, especially where butted glass is used. We moisten the glass first, then rub it over with a rag, when a fine jet of water from the hose from ridge to gutter plate completes the work.

If you want to grow some of that useful little polyantha rose, Clothilde Soupert, for Spring sales or cutting during next Summer, now is the time to put in some cuttings in a hotbed. They root very quickly, and are best carried over early Winter in small pots, in a cool house.

While attending to our current work, we must not overlook procuring soil for another year. There are undoubtedly many men who neglect this work until almost time for commencing replanting and for quite a long time afterwards they are troubled greatly by the grass growing from the green sod. That is not the only trouble, for it often times happens that owing to pressure of other work, the soil is obtained from the first and nearest spot, irrespective of whether or not it is best adapted to the future welfare of the rose. There is no question but that one of the fundamental principles in successful rose-growing is in procuring a soil best suited to their needs, so we should be most careful in its selection. I find a soil that suits most varieties to be of a good fibry sod, from a pasture of a medium heavy texture; that is, a soil not light or the extreme of heaviness; and much prefer taking it from low lands, but am careful to avoid that which has not been mown or grazed for years, as the large accumulation of grasses, mosses, etc., thereon makes it too light, and it has too much of a leaf-mould appearance when thoroughly rotted down. A good strong loam is what is needed; nothing of a mucky nature. It is sometimes perplexing for those engaged in growing inside a city's limits to know where to get soil near enough at a reasonable cost. We were in that predicament this year, and as we had to get our soil from a point six miles distant, we found the most inexpensive way was to carry it by boat, as the canal was near by at both ends. Soil should not be drawn in wet weather.

H. H.

## Some Good Decorative Roses.

*Rosa multiflora* is to my mind one of the very finest of climbing Roses. When once established it is a strong robust grower, sending up shoots from 10 to 12 feet in length in one season, and every year is covered with beautiful single white flowers, so heavy indeed is its white mantle that we have difficulty in convincing one who sees it for the first time that it is a Rose. The picture of *Rosa multiflora* on the first page of this issue gives one a clear conception of the habit and flower of this beautiful Rose. The picture shows a fence covered with the Rose, and so satisfactory is it that we use it a good deal in this way, also for banks, or for covering tree stumps; and for running over the lower limbs of tree in the wild garden nothing could be more beautiful. The leaves are quite large, of a beautiful dark green color, and always look well even when the plant is out of flower. It is very healthy and rarely do we find any insect pests bothering it.

Other Roses we use for like work, and which do equally well are:

**Bennett's Seedling** from the Ayleshire; it is pure white, double flowers of medium size, and grows 15 feet in one season. Very free flowering. A beautiful Rose to ramble over a tree or a rustic seat.

**Dundee Rambler** (Ayleshire) a white semi-double flower, is a fit companion of the above in every respect. Of easy growth, it will thrive in a very poor soil where no other Rose would exist; it very often sends out shoots from 15 to 20 feet in length which in their season are quite covered with the small flowers.

*Rosa setigera* is also a charming Rose for the wild garden, flowering after those just named are past. It lengthens the season of bloom very agreeably; the flowers are of a deep rose color, fading to white, therefore it gives a decided range of color when in flower; the newly opened buds are deep rose, and from this there is a gradation through all stages of pink to almost white on the same plant. The plant is of the strongest habit, sending out shoots 20 feet long.

All of these Roses named should be given their own free will, not being checked in any way, and do very little with the pruning knife, merely removing dead wood. Bend the branches to some object that will furnish some support so that the wind will not break them. Treated in this easy, natural way, any of these Roses will be in place in any part of the grounds.

P. BISSETT, Washington, D. C.

## The Fruit Garden.

**Peach, Crawford's Late.**—This is a decided failure with me this year, owing to a very hot spell on September 10, 11, and 12, following a long cool period, the fruits at that time being about two-thirds grown. Since then they have not grown any and are now dropping badly, and to all appearance are dead-ripe culls. Trees of Crawford's Early from which we began to pick on September 18, are laden with full-sized, firm fruit, ripening very slowly. This has been a very peculiar summer, anyhow. I see that we began picking Crawford's Early on September 3, last year. I believe I mentioned in a previous note that peaches and grapes were about two weeks late, and here I am with Late Crawford culls dead ripe, ahead of time, for I see we began on them last year on September 20, so that peaches and time are slightly mixed, but not the trees; they are all right. I have charged the mixing to the weather.

**Apples** are fine, but dropping rapidly; we are picking full two weeks earlier than usual, for by the usual time there apparently would be nothing on the trees to pick.

**Currants.**—The bushes are practically bare of foliage, with some fruit trees in the same uninteresting condition. Those most affected are Belle Magnifique cherry, Transcendent crab apple, with Flemish Beauty and Buerre Diep pears. This has been a fruitful season for fungi, there being so much cold, dull, unsettled weather through July and August that

spraying did not control the fungi on the trees mentioned.

These notes sound so much like a constant grumble about the weather that I better stop and start in fair weather.

J. HOLLOWAY, L. I.

## Notes from Louisiana.

After a long hot summer, September has set in cool, for which we should all feel thankful. I spend every minute that I can in the gardens, and notice that all the Roses I cut back three weeks ago are full of tender red shoots, and in a little while we will have our autumn Roses in plenty. I cut out all *Salvia* spikes, not waiting for the top buds to open, and the big plants are scarlet.

*Rudbeckias* are a mass of flowers; I

FIG. 192.—INCREASING THE WAGON'S CAPACITY.

notice something being written of their coarseness. I do not find them coarse, they are such a bright, clear yellow, and the foliage is so clean and green.

The blue *Solanum* is hanging full of clusters of flowers; it is not purple here, neither is *S. Wendlandi*, clusters on the latter were a foot across and lasted for weeks. Blue *Solanum* has drooping clusters of large red berries the size of grapes and is very ornamental.

Balsams from self-sown seed are just in good bloom and are much finer than from seed sown in spring. Little self-sown Japanese *Glories* are full of big, lovely flowers that will increase in beauty as the weather gets cooler.

**Allamanda Hendersoni.**—A small plant set in a half-gallon bucket last spring is now, September 7, four feet tall and branching. Since the first of July it has been full of big, lovely yellow flowers, and still new buds are forming; the foliage is not dense and the flowers stand out well on the plant. The foliage is

FIG. 193.—SUGGESTION FOR A VILLAGE LOT.

long, smooth, and shining, and the plant droops with the weight of flowers. I shall start a small plant for the gallery and next spring set the big one in the garden. Here a fast-growing plant soon gets too heavy for a woman to handle in a pot. I have a Palm that measures over 10 ten across, and what to do with it this winter I really do not know. If there was a marriage or "swell" entertainment every day in winter it would be little trouble to me, as it is always loaned for such occasions.

*Clematis paniculata*, for the last six weeks has been lovely, a sheet of white fragrant flowers; it is called an autumn bloomer, but here opened its first flowers in July, and now, September 3, still has scattering clusters of bloom. I think anyone in the cut flower business would do well to have this vine. It is easy to manage, hardy, holds its foliage, and is

never troubled by insects; just a small spray of flowers will scent a room, and for bordering bouquets nothing could be prettier. Coming as it does when there are so few white flowers, makes it a valuable plant. *Clematis crispa*, a native blue, and *coccinea* an imported red, are both profuse bloomers here from early spring till frosts; these latter two die to the ground in winter and early in spring throw up long tender dark shoots that soon branch and cover the vines with flowers. The large flowered *Clematis* flower well here in the spring and a few flower in fall.

**Aristolochias.**—*Elegans*, from seed self-sown last year, is full of flowers, and as this is the only one that has no offensive odor, it is very desirable. Start the vines on strong twine and they will climb to the tops, and in a few weeks the twine will be strung from the bottom to the top with the really pretty, curious flowers. The foliage is small, smooth, and heart-shaped. *A. ornithocephala* has been in bloom some time; the flowers are very large, curious, and plenty of them, but the odor is not desirable at all; *A. gigas Sturtevantii* is immense in leaf and flower; here in rich soil and with plenty of sun the flowers often measure one yard in length and half a yard across; a vine in full flower is a sight to behold. This year I have mine in the far lot, for the smell is so terrible that I will never have one near the house again, but all the same it is a grand vine.

*Gynura aurantiaca* (see page 621) here in Louisiana makes a nice plant for outdoors, but I notice a plant growing where it is in partial shade nearly all the time is much richer in color than plants that have sun all day. Years ago I had a very fine *Gynura* plant; the foliage was much larger than any I can grow now, the coloring, too, was much richer. I kept the plant on an upper window shelf in the living room, and it had little sun; in spring I pinched out the ends and put the plant in a cool sheltered place; it bloomed in summer, then mealy bug that came in plants I bought destroyed it; the flowers are yellow and insignificant.

MARGARET E. CAMPBELL.

## Plan for Village Lot.

The accompanying plan for laying out a village lot has given such satisfaction to the writer that he reproduces it as a suggestion for others. The half-circle driveway is both ornamental and exceedingly convenient, as it does away with the necessity for all turning of teams. You drive in at one entrance and out at the other. The plan shown does not provide for a stable, but when this is an adjunct of the premises, a driveway to it takes the place of the walk to the back veranda, that is shown, the entrance curving slightly as it leaves the half-circle driveway. Such an arrangement of the grounds gives an excellent chance for the disposal of shrubbery, and leaves an open space in front that can well be utilized for flowers.

W. D.

## Increasing the Wagon's Capacity

It is frequently desired to haul to market, or from the garden or field, a load of bulky, but light, produce, such as cabbages, squashes, etc. The ordinary farm wagon will not hold half, perhaps, that the team could haul. In such a case he contrivance shown in the cut will be found very useful. It is a strong, but light frame made of a size and shape to set into the body of the farm wagon, occupying the whole space. The back can be arranged to let down on hinges, if desired, for convenience in unloading.

## New York Botanical Gardens.

As we go to press we learn that the Board of Apportionment and Estimate has voted the appropriation of \$500,000 as instructed by the act incorporating the Botanical Gardens. The City of New York is to be congratulated at this successful termination of a long struggle between opposing factions.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1897.

PUBLISHED BY  
A. T. DELAMARE PTG. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 3154 Cortlandt. P. O. Box 1697.  
REGISTERED CABLE ADDRESS  
Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 15 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## WANTED.

Copies of AMERICAN GARDENING for March 20, 1897. Address the Publishers.

**The Chrysanthemum Rust.** SPECIMENS of diseased Chrysanthemum leaves recently submitted by a New Jersey florist were submitted to Dr. Halsted for examination and advice as to the course of treatment to be pursued. His reply is as follows:

"There is a genuine rust upon the cultivated Chrysanthemum sent by your correspondent, and it probably is the *Puccinia tanacetii*, D. C. There is doubt as to the species, because only the uredo spores have been found upon the leaves examined, but these agree in size and shape with those of *P. tanacetii*, and furthermore this species is found upon a species of Chrysanthemum as shown by an herbarium specimen.

"The florist has written me that he may lose his whole crop from this rust. It appears upon the foliage in small brown spots, which consist of heaps of spores borne upon the tips of threads that have pushed through the skin of the leaf. The Carnation rust is not unlike this in general appearance, but the final spores are very different, provided the Chrysanthemum rust proves to be as suspected.

"Growers of Chrysanthemums should

look to their plants, and if any find the rust it ought to be dealt with summarily, for the enemy is a serious one. The rust fungus sends its threads all through the plant before the spores are produced, and therefore spraying may not prove a satisfactory remedy for it. All affected leaves should be picked off and burned."—BYRON D. HALSTED, Experiment Station, New Brunswick, N. J.

**City Shade Trees.** UNDER our modern system of constructing streets, this is in fact a misnomer, for there are not and cannot

be healthy trees of any size in the great majority of completed streets. This is because the residents in them are either too poor in æsthetic education to appreciate them or so destitute of the necessities of life as to be without thoughts of a horticultural nature; and on the other hand, wealthy residents admire and demand such perfectly shod streets and avenues of asphalt and kindred material from side to side that hardly a spot of Mother Earth can be seen, unless, as sometimes happens, the spot be about the base of a relic of past poverty days and dirt roads.

Do our city fathers believe that trees can thrive on the rains that run into the sewers coupled with a bountiful supply of water, gas, and electric mains at the roots, not to mention little amputations done by the stringer of our disfiguring overhead wires? And again, the trees are being crowded to the wall by the elevated railroad here and there. We cannot have waterproof avenues and vigorous shade trees at one and the same time.

We usually start well when opening a new street; some country-loving citizen plants and suggests planting trees, which, by the bye, as a rule, has to be done several times before the small boy forgets to whittle the bark from the trunk, and the city drivers find out that the tree is not a juvenile hitching post. These trifles past, the trees begin to feel their feet, as it were, and try to forget they are now city trees, not minding the few cobblestones in the street and the modest three-foot slabs for a walk, later. But the three feet is soon replaced by a six or eight-foot paving right up to the cellar walls of the artistic flat, the occupants of which soon decide that nothing but an asphalt road will give style and repose to the neighborhood; this last it certainly does, for the trees (thinking, no doubt, of style) soon dwindle and die in repose, and stone and brick remain to constitute the beauty of our great modern cities. And this is the end, unless some public-spirited officials see the need of a breathing spot for the tired-out every-day toiler.

Such officials may truly be called public benefactors, and it is gratifying to see so many coming to the front in that great humane work of creating so-called city parks. In these our hopes must center and herein only (with few exceptions) can we look for and expect to find flourishing city shade trees.

The necessities of the modern city life having chased our shade trees into other breathing spots, or out into the suburbs, which latter stand to the man of means, as does the city park to the poor, we run over in our mind the available

material and are surprised at the small number of trees which are really suitable for the work in hand, being all the time reminded of the large number of beautiful deciduous and evergreen trees that will not even do fairly well in these "parks."

Starting, we place *Salisburia adiantifolia* (Ginkgo tree) at the head of the list. This wherever we have noted it in Hartford, Conn., Newport, R. I., Brooklyn and New York, N. Y., and Washington, D. C., has been a clean tree almost exempt from insects and disease. The tree is a vigorous grower with foliage of a peculiar shape and color, and added to these qualifications, is its fantastic or eccentric style of growth; it is one of the first trees to catch and hold the attention of beholders, as a very uncommon and beautiful tree of medium size.

Next may be placed *Liriodendron tulipifera* (Tulip tree or White wood). This has also a peculiar appearance, inasmuch that the tips or points of the leaves are missing. The color of the foliage is of a light shade, always clean, and being smooth any dust is easily washed off. The habit is of a decided pyramidal cast, spreading considerably at the base if given room; add to these the wealth of Tulip-like flowers and it may be added up as a vigorous, clean, straight, ornamental tree of large size.

*Acer platanoides* (Norway Maple) is commonly looked on as the ideal city tree; it varies considerably from the natural habit of a round-headed top of dark-green leaves which turn to a russet brown yellow in autumn.

To many persons *Acer saccharinum* (Sugar Maple) is far superior, especially for avenues or as a single specimen, making an almost too regularly pyramidal tree, the branches coming out horizontally with a slight upward curvature. The foliage is not quite so heavy as in the Norway Maple, but usually it colors finely in the autumn, ranging from a very light green to a clear orange and crimson, which characteristic each individual tree appears to retain in a more or less fixed degree every year. Some of these specimens in health and in their showy autumn colors are objects not to be soon forgotten, or easily effaced by any other ornamental deciduous tree. For effect "en masse" we recall a wonderful color panorama seen when riding from the Profile House to Sugar Hill in the White Mountains, the third week in September. Together with them was the golden hue of the Yellow Birch so plentiful in that locality. The whole forming a sight long to be remembered.

Such then are a few outline ideas of the city shade tree question, and to what end does it all lead? Simply to the conclusion which year by year is more forcibly impressing itself upon us, that modern commercial conditions preclude the general street planting of trees and that there is a demand of growing intensity, a demand that is wrong from the tollers of the factory by increasing competition to obtain the wherewithal to support life, a demand for that pure air of ages gone. This can be to some extent supplied by the establishment of city squares.

Park commissioners and city governments in the name of humanity devote more attention to multiplying small park areas in crowded districts.

## BIG BERRIES FOR ALL.

Being the Cultural Methods of Henry Jerolaman, the N. J. Strawberry King, Preceded by an Autobiography.

Continued from page 651.

After moving to Mendham my father rented out the old farm on shares, that is, for one-half of all crops grown. This grain was divided on the farm, my brother and I carting and selling it in Newark at odd times during fall and winter, sometimes we sold it at Drake's mill near Irvington, some four miles on our side of Newark.

In going to Drake's mill we passed a beautiful farm fronting on the main road for three-quarters of a mile. I told my father about this farm, as it then was owned by a Bishop Hughes from Ohio, who wanted to sell it and go back to Ohio. I persuaded father to come down and see it, telling him as an inducement that we could sell right at our door all we could grow on it, and not have to work all night. When father saw the farm he gave me a scolding and forbade me to say anything more about it, as the area was too small for him. I answered, saying that if he did not buy the farm I would. This engagement I never forgot, and I think can safely say have never been known not to do that which I have promised; I try always to keep my word. This farm is located near Drake's mill on the road leading to Irvington, then known as the Arbor, now known as Irving Place.

To make a long story short, I will simply state that after my brother and I told father we would not stay longer at Mendham, he sold or traded the Hilltop for some property in Twenty-fifth street, between Sixth and Seventh avenues, three houses in a row then owned by Robert Orr, the builder of the Croton Aqueduct. We helped father move to the city, and he then told me I could go to the public school (I called it the pauper school), or earn my own living. Choosing the latter, I went to Brooklyn, N. Y., into a store, and let it suffice to say here, that year after year I went out to see the farm just referred to. It had changed hands several times when I bought it in 1865, and on it I lived from then until 1870, when Seth Boyden (who owned a farm that nearly joined one portion of my farm), died. After his death, in the spring of 1870, I bought the Boyden place, my present residence.

While on the Arbor farm, as it then was called, I tried almost everything to make my word good with father, to get off of one acre more than he had ever received in one year from the whole farm. I did very well with tomatoes, selling the early ones at \$1.25 per basket in July, as my books show, but the expense was great and I did not make clear over \$200 per acre; the nearest I came was with Norway oats. I had a large field of this and I made over \$4,000 (I paid income tax on \$2,000) per year on this farm, working more than five times the land I do now.

As soon as I bought my present place I commenced to grow strawberries. I had never set a plant nor had I ever seen a plant set at that time, and when I bought Boyden farm, as I called it, I only found a small bed of Boyden No. 30, but three short rows 9 feet by 13 feet in length. As I stated, I bought this place in the spring of 1870, and in July of the same year I prepared one-half acre of the best of the land, gave it a good heavy coat of barnyard manure, hired a first-class gardener who came all dressed up like a gentleman and had his tools with him. These were embraced in one piece of iron, bent over at one end for a handle, the other end, about one foot long, was sharpened to a point; the iron was about one and a-half inches in diameter (I found out after that it was a trowel or cabbage setter).

The gardener drew a line and called for plants. I took them up with a spade, and incidentally cut a great many in two with the spade, "but," said the gardener, "that made no difference so long as they had any roots they would come

on all right." I remember that he set out the plants much faster than I could dig them up with the spade; all he did was to walk alongside of the line, stick down his iron peg in the ground, pick up a plant, and drop it in the hole he made with his peg, then taking his peg he would stick it alongside of plant and give it a push which would hold the plant fast in the hole, so that the wind did not blow it away.

I should state that he made me drop the plants one about every foot alongside of the line, and when I spoke to him about the loose and careless way he was setting the plants, suggesting it would be better to press down the soil on each side of plant with his hands (I thought if he did that I could keep up with him), I never shall forget his answer; it was about as follows: "Look here, who is doing this, you or I? I'll be — if I will get down on my knees (and soil my hands) for you or any other man, and if you do not like my way of setting out plants, set them yourself. I have set out plants for years before I ever saw you, and I know my business." He did, his business was to get my money. He got it.

About one-half of the plants died, and perhaps the others would have died too, had it not happened that I had a contrary horse that every time he was put to a cultivator, if you attempted to drive or lead him, would either go backwards or sideways, taking one row with his fore feet and another with his hind feet, and what plants the horse did not tread on I did with my feet while trying to keep the cultivator from tearing up the whole business. I found out after we (myself and the horse) had cultivated the strawberries that the horse evidently knew more about setting strawberry plants than the gardener or I. The plants on which we had trodden (except those that we had knocked entirely out of the ground) all lived and did well. This taught me a lesson, and in after years when in spring after uncovering my plants, if I found some that the frost had heaved up, I take a board and get on it and then press them back in the earth. I find by looking over the books that this one-half acre cost me to fertilize, plow, keep clean, cover, and pick and cart to market, \$83.60, the total income from fruit sold was just \$64.25, a net loss of \$19.35. This looks a little discouraging, but I remember telling father when he asked me when I expected to beat his farm with one acre, to wait, father would answer "O yes, I guess it will be wait."

My father had moved from New York City back to Newark, N. J., and often drove out to see me during the summer of 1871 after picking the berries. The strawberries picked in 1871 were dirty or sandy, the same as Southern berries, and brought only a trifle more, although they were much larger. I had not commenced to mulch them. My neighbors would often joke with me and ask how my one-half acre of strawberries paid or "panned out," as some called it. They had never seen a half-acre of strawberries set out in the place. Among them was a middle-aged man, Mr. Ogden Brown, who often came down to see my field of strawberries; he came one day when I was picking strawberries (I was picking in a wooden tray—butter-dish). Laughing at me, he said, "Mr. Jerolaman, I suppose you came out here to teach us folks how to grow strawberries? You city folks must always come out here to teach us something." I was a little nettled or angry as some would call it, but I answered him with a smile, "Yes, Mr. Brown, you are perfectly right; I have come here to do you and all my neighbors good, not evil, and I propose to teach all Middleville (as it was then called) how to grow strawberries, and I will if I live."

Mr. Brown answered me with fire in

his eye, and stamping down his cane, said: "Come up to my place and I will show you a little garden patch that has more and better berries on it to-day than your whole field." Show us, will you? Dropping my tray, I said, "All right, I will go with you right away, Mr. Brown, for I well know that where there is concentration there is power, and I want to see the little patch that will beat my one-half acre, and then I will beat your patch."

He was in good humor by that time, and when I saw Mr. Brown's patch I knew at once what was wanted. I noticed that his berries were much larger than mine, although they were the same variety (Boyden No. 30), and that he had put a heavy coat of stable manure all around and between his plants, and that the berries were much cleaner looking than mine, as the straw in the manure had kept the soil off the berries when it had rained.

But that which I noticed most was the berries on one side of a row next to the walk, where Mr. Brown in mowing his grass plot had taken the grass and strewn it on the path; on that side the berries looked as if they were varnished, they had such a gloss. I said nothing to Mr. Brown at the time about this, but bidding him good-bye, I went home thinking. As there was a piece of salt meadow that went with this place when I bought it, I had all the salt hay mowed the next month. I kept the one-half acre clean as I could all by myself, so as to show a profit the next year.

### The Henry Strawberry Is Controlled Exclusively by American Gardening.

Mr. Jerolaman wishes it to be distinctly understood that he is not a nurseryman, but is a fruit grower; it is not his business to sell plants. Hitherto he has disposed of a few plants in order to have the variety generally tested. For the future, however, the Henry Strawberry plants will be distributed only as premiums through AMERICAN GARDENING.

Plants will be delivered from now onward through the month of October, or until the ground freezes, which in the place where the plants are growing is not until December. Mr. Jerolaman always sets out plants for himself until the middle of November, and in some seasons even up to the end of that month.

### Treatment of Plants on Receipt.

Enquiries from some readers necessitate the advice to set out the plants at once on receipt, shading them if the sun be very hot, and shading them in the middle of the day. There is no necessity whatever for anyone to put the plants into a cellar for a day or two before planting out.

Of interest to all engaged in agriculture in any of its branches will be the Congress of Agricultural Industries, to be held at Omaha during the Trans-Mississippi Exposition period. This congress will be composed of representative delegates from State Boards of Agriculture, agricultural journals, horticultural societies, dairymen's associations, live stock breeders' societies, and all other kindred organizations, and will continue in session for from two to four weeks, during which time a number of national agricultural societies will also hold their annual conventions in this city.

Four State Meetings in One.—The annual meeting of the W. Va. State Horticultural Society, Sheep Breeders' and Wool Growers' Association, together with the State Board of Agriculture, will be held at Martinsburg, October 12, 13, 14, 15, 1897. The Horticultural Society will open the four days' session on the morning of the 12th; the last two days being given over to the State Board of Agriculture and State Grange.

The foreign walnut crop is reported as short this year.

**W. & D's.**  
**CELEBRATED SURE CROP.**  
**MUSHROOM SPAWN.**  
**8 LBS. FOR \$1.00.**  
 Lillum Marish, Roman Hyacinths, Freesias,

## PRICE LIST FOR Exhibition Stationery

1000 Entry Forms . . . . .	\$2.75
Two Exhibitor's Books . . . . .	2.00
Two Glass Books . . . . .	2.50
Six Judge's Books . . . . .	3.00
500 Entry Cards . . . . .	3.50
500 Pastors (assorted) . . . . .	1.00
<b>Total . . . . .</b>	<b>\$14.75</b>

Secretaries of Horticultural, Agricultural,  
 or any other form of competitive show, are  
 invited to write us for full particulars.

It is freely conceded that the system we  
 have adopted saves time, temper, trouble,  
 worry and expense.

The clerical work of every exhibition, large  
 or small, should be run on business lines, and  
 you will find this system the best, the easiest,  
 least expensive, and most satisfactory. Ad-  
 dress correspondence

**A. T. DE LA MARE PTG. & PUB. CO. Ltd.**

P. O. Box 1697, New York.

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent  
 appointments and movings are requested to  
 forward particulars of the same for publica-  
 tion in this column. No charge is made.

A yellow Canna of remarkable intensity  
 has been received from Mr. Hanson, who  
 has charge of the gardens of Dr. Warder,  
 Irvington-on-Hudson, N. Y. The seg-  
 ments of the flower are of but moderate  
 width, inclined to narrow, but in color  
 they surpass anything that we recall.  
 They are of a rich Indian yellow, equally  
 intense on both upper and lower sur-  
 faces; the numerous small splashes of  
 pale red on the inner face of each segment  
 are so thin as to appear pale brown ex-  
 cept on one segment where a few are  
 more decidedly red.

We are in receipt of a copy of the Jour-  
 nal of the Kew Guild No. V. It contains  
 a portrait and memoir of J. G. Baker,  
 Esq., portraits of some deceased leading  
 gardeners who were once at Kew, and  
 the present address list of old Kewites.

Birth.—At Wethersfield, Conn., Septem-  
 ber 25, the wife of David McFarlane of a  
 son.

### Show Fixtures.

Secretaries of societies are invited to  
 forward dates of coming exhibitions so  
 that an announcement may be made in  
 these columns.

### Mount Kisco, N. Y.

M. J. O'Brien who has for several years  
 served as gardener to Mr. Robert Scoville,  
 at Chapinville, Conn., has entered the  
 ranks of commercial florists, locating in  
 this town, where he hopes to build up a  
 profitable local business. The contract  
 for building and heating his greenhouse  
 has been awarded to Henry W. Gibbons,  
 of New York.

### Poughkeepsie, N. Y.

The next meeting of the Dutchess  
 County Horticultural Society will be held  
 at the Court House, Poughkeepsie, Octo-  
 ber 6, at 1:30 P. M., when a paper will be  
 read by Mr. William Russell, entitled "My  
 Experience With Greenhouse Grapes  
 Grown Outside."

### Mincola, N. Y.

At the Fair held here this week, the dis-  
 play of William L. Swan of the Seawan-  
 haka greenhouses, Oyster Bay, was the  
 center of attraction in the floral depart-  
 ment. His magnificent exhibit of palms,  
 some of the specimens of *Areca lutescens*  
 spreading to a height of ten feet, occupied  
 the center stand of the building. Some fine  
 specimens of *Araucarias* attracted con-  
 siderable attention. Mr. Swan's collec-  
 tion, which consisted of over 200 pots  
 and baskets, contained some fine spec-  
 imens of ferns. P. H. Scudder of Glen  
 Cove had a large display of palms, ferns,  
 and greenhouse plants. John Lewis Childs  
 of Floral Park, the finest display of Glad-  
 ioli ever seen here, and a large display of  
 miscellaneous cut flowers; G. Rogers of  
 Hempstead, a large assortment of green-  
 house plants, Geraniums, Begonias and  
 Coleus; Ferd Boulon of Sea Cliff, some  
 handsome floral designs, Roses, Carna-  
 tions, and palms. Oasis Nursery Com-  
 pany of Westbury exhibited Cannas, Be-  
 gonias, and shrubs.

### Philadelphia.

The principal event of the past week  
 was the third annual exhibition of the  
 American Dahlia Society held on Septem-  
 ber 21 and 22 in Horticultural Hall. The  
 show was quite a success and from the  
 interest taken clearly shows that more  
 attention is being given to the cultiva-  
 tion of the Dahlia than formerly. The  
 judges were Thomas Cartledge, Edwin  
 Lonsdale, and William K. Harris.

W. P. Peacock filled two large tables  
 with Dahlias which he had grown as

trials for the Dahlia Society; among  
 them were some grand flowers. The two  
 tables were gone over carefully by all  
 growers of Dahlias, who were thus able  
 to determine the value of each variety.

Among the Dahlias were a great many  
 American seedlings, one of the prettiest  
 of which no doubt is Gilt Edged, a fancy  
 variety with medium-sized flowers, com-  
 posed of peculiar-shaped petals, edged  
 golden yellow. It is an exceedingly free  
 bloomer, and of an almost new type. It  
 is introduced by A. Blanc. In the same  
 exhibit were Grand Duke Alexis, a flower  
 absolutely unique; the form and color  
 are perfection, being large and globular,  
 petals nicely rolled, of a creamy white,  
 shading to pink. Others noticed were  
 Colossus, a giant in size of bloom; Glori-  
 osa, a glowing scarlet, brightest of all  
 the cactus type; Blanche Keith, un-  
 doubtedly the best yellow; Mrs. Glad-  
 stone, an English variety of great merit;  
 Matchless, a fine dark variety; Miss  
 Florence Shearer, a delicately shaded  
 lavender; Snow Clad, a pure white pom-  
 pon.

Premiums awarded were as follows:  
 Largest and best general display—  
 First, William Henry Maule; second, A.  
 Blanc.

Cactus Dahlias, vase of 50 one color—  
 First, A. Blanc for William Agnew;  
 second, W. H. Maule for Red and Black.

Twenty-five blooms, one color—First,  
 W. H. Maule for Clifford W. Bruton.

Show Dahlias, thirty-six blooms, red—  
 W. H. Maule for Ruby Queen.

Thirty-six blooms, white—A. Blanc for  
 Glory of Lyons.

Thirty-six blooms, pink—W. H. Maule  
 for A. D. Livoni.

Thirty-six blooms, yellow—W. H.  
 Maule for Pluton.

Fancy Dahlias, twenty-five blooms,  
 tipped—W. H. Maule for Frank Smith.

Twenty-five blooms, margined—W. H.  
 Maule for Fern-leaved Beauty.

Twenty-five blooms, blended and  
 shaded—W. H. Maule for La France.

Twenty-five blooms, mottled—A. Blanc  
 for Uncertainty.

Twenty-five blooms, any other color—  
 A. Blanc for Mrs. Gladstone.

Pompons, vase of white—W. H. Maule  
 for Snow Clad.

Vase of any color—A. Blanc for Virid.  
 Singles, twenty-five blooms, striped—  
 E. Clifton Taylor for Novelty.

Six largest flowers any variety—A.  
 Blanc for Colossus.

New seedling, best of any type, not yet  
 introduced—First, A. Blanc for Gilt  
 Edged; second, E. Clifton Taylor for  
 Single Surprise.

Novelties in Dahlias—A. Blanc for  
 Grand Duke Alexis.

Best display by an amateur—First,  
 John McGowan, gardener to Mr. Bay-  
 ard, Germantown; second, James Camp-  
 bell, gardener to Mr. J. D. Winsor, Haver-  
 ford.

Cannas, best display of flowers ar-  
 ranged in flat dishes filled with sand—  
 First, A. Blanc; second, Henry A. Drer,  
 Inc.

Collection of Cacti—A. Blanc.

### Flowers at Bristol County Fair, Taunton, Mass.

The 74th exhibition of this Society was  
 conceded to be the best in nearly all its  
 branches. The display of fruits, flowers,  
 and vegetables was very good and more  
 extensive than usual. Among vegetables  
 the prize for the most extensive display  
 went to Col. F. Mason, Riverside Farm,  
 Taunton (E. C. Lewis, manager), who  
 staged an admirable table of 170 var-  
 eties; this did not comprise any of the  
 dried peas, beans, corn, and various seeds  
 usually seen in such displays. All the  
 numerous vegetable classes were keenly  
 contested.

The schedule of this Society for fruits  
 and vegetables is copied somewhat after  
 that of the Massachusetts Horticultural  
 Society's fall show. Among fruits  
 apples were of good quality, while pears  
 were smaller than usual; peaches and  
 grapes have been more largely shown,  
 but quality was good. In cut flowers  
 the display of Dahlias was much finer  
 than at the recent Boston show; H. F.  
 Burr, Taunton, was the largest exhibi-

tor, staging 2,500 blooms in 850 varieties; other large contributors were Winter Bros., Mansfield, Mass.; John Endicott & Co., Canton, Mass., etc. The leading winners in the other cut flower classes were Dr. O. S. Paige, W. N. Craig, C. P. Borden, Briggs' greenhouses, and A. C. Lane. Plants were more largely shown than usual. W. N. Craig captured first and special for general display; other exhibitors were C. P. Borden, Dr. O. S. Paige, and Mrs. C. S. Sweet. C.

### New York.

The horticultural display in connection with the 66th fair of the American Institute is now in full swing at Madison Square Garden, New York, and it merits the careful attention of all who can visit it.

The display of Dahlias fully comes up to what was anticipated, and doubtless is the greatest display ever made in New York City and possibly in America. More than 20,000 blooms were staged in competition and many of the classes were keenly contested; some of those competitors who had to take the minor honors coming very close up to the more successful rivals. A great change is noted from last year. Then W. P. Peacock, Atco, N. J., and Rev. W. C. Bolton were practically the only exhibitors of high-class blooms. This season there is a very much larger number of exhibitors, some of whom have come great distances. Another pleasing feature is the large increase of purely amateur exhibitors. Among these notably were D. Wilson, Orange, N. J.; W. H. Smith, Maplewood, N. J.; Rev. C. W. Bolton, Pelham, N. Y.; J. Holloway, Glen Cove, N. Y. Among professionals were W. P. Peacock & Sons, Atco, N. J.; H. F. Burt, Taunton, Mass.; Lothrop & Higgins, East Bridgewater, Mass.; C. W. Ward, Queens, L. I.; and J. L. Childs, Floral Park, N. Y.

John Lewis Childs, Floral Park, made a superb showing of hardy and half-hardy perennials and bulbous plants. Tritomas were very striking, especially the vase of T. Pfitzeri. Montbretias were admirably represented with three grand vases of M. crocosmæiflora, M. Sollei Couchant and M. elegans. The quaint Spider plant Cleome pungens in red and white forms with Phloxes and Lillium speciosum Melpomene were all noteworthy. The showing of Gladiolus from the same firm was unique, no finer showing of this flower having ever been made in this city. One hundred vases containing from six to a dozen or more spikes in each made a display brilliant beyond description in color effect and variable enough to meet the color fancies of all beholders. Among them we noted particularly fine Torch-Light, Canary Bird, W. Falconer, Eugene Souchet, Columbia, and Lamartine. Tuberous Begonias, single and double, giant Cockscornes, Tuberoseas, Verbenas, and Zinnias in fine strains also came from Mr. Childs.

The finest collection of hardy perennials was that from H. McK. Twombly, Esq., Madison, N. J. (gardener A. Herrington). Some of the newest hybrid Tritomas were shown in this group as Ophir, H. Cannell, and Star of Baden-Baden, this last one of the finest varieties yet raised. Rudbeckia, Autumn Glory, Verbena venosa, Lathyrus latifolius, the new Helenium grandicephalum striatum and some of the finer hybrid Asters were shown in large bunches of each kind, illustrating well the floral riches of this season to be culled from well-planted herbaceous borders.

W. H. S. Wood, Greenwich, Conn. (gardener, J. W. Duncan), was a large exhibitor of hardy flowers, prominent in his group being large bunches of Physalis Franchetti, Eryngium planum, Baccharis halimifolia, Caryopteris mastacanthus, Aconitum Fischeri, and the fragrant Cedronella cana.

A collection of hardy shrubs mostly bearing berries, was also shown by Mr. W. H. S. Wood. This was a most interesting and instructive exhibit. Prominent in fruit were Berberis Thunbergii, Celastrus scandens, Ilex verticillata, Laurus Benzoin, Lycium chinense, Amelanchier spicata, Hippophae rhamnoides, Shepherdia argentea, Dimorphan-

thus mandshuricus, Eleagnus umbellatus, and Viburnum opulus. Flowering shrubs in the same group included Lagerstræmia indica, Spiræa tomentosa, Vitex agnus-castus, Caryopteris mastacanthus, Desmodium penduliflorum, Abelia rupestris and Spiræa Anthony Waterer.

### Wild Flowers.

Great interest is always evinced in the wild flower class, and here A. Herrington made a great showing with over 60 vases of distinct species. There were Golden Rods in nine forms, Asters in like number and besides large vases of the Fringed Gentian (G. crinita), the closed Gentian (G. Andrewsii), Chelone glabra, and others. A smaller but charmingly varied collection was shown by Miss Ida C. French, Springfield, N. J. Asters and Golden Rods were numerous here with Lobelias, Achilleas, Gerardias, Evening Primrose, Chelone, etc.

Carl Blomberg, gardener to Oakes Ames, Esq., North Easton, Mass., on Tuesday made a display of Water Lilies and also a great display of native wild flowers.

### Plants.

From the F. R. Pierson Co., Tarrytown-on-Hudson, N. Y., came a large miscellaneous collection of foliage plants—Palms, Dracenas, Pandanus, Araucarias, etc., while the many fine specimens of Nephrolepis davallifolia and Bostoniensis disposed around the hall were from the same firm, as also a charming group of coniferous trees in pots.

H. A. Siebrecht & Son exhibited two fine pairs of standard and pyramid Bay trees which were conspicuous ornaments to the platform.

J. M. Thorburn made a great exhibit of vegetables and other products of their seeds, the Squash family in every conceivable form, Egg plants of a fine strain, Beans in great variety, Peas of good quality, and other seasonable vegetables too numerous to mention in detail.

Weeber & Don put up a tastefully arranged exhibit of garden requisites and products, onions and tomatoes, both being represented by excellent samples in the finest standard varieties. The arrangement of this exhibit calls for special comment, as we rarely see such tasteful staging. Among garden requisites the Mushroom Spawn, a specialty of this firm, was shown in quantity and of high apparent quality.

The collection of nuts from Parry's Pomona Nurseries, Parry, N. J., was more extensive and even more remarkable than that which attracted so much notice at the show last year, chestnuts of immense size were Paragon, Success, Comfort, and Parry's Giant, Persian, Japan, and American walnuts, with hickory nuts and filberts contributed to this unique display.

From W. Rockefeller, Tarrytown, N. Y., (gardener William Turner) came six immense fruits of Pitmaston Duchess Pear gathered from pot-grown trees. Visitors seemed loth to believe that these magnificent products of garden craft had been grown in this state.

Next week there will be a great display of fruits, also stove and greenhouse plants, cut flowers, etc.

There is more Catarrh in this section of the country than all other diseases put together, and until the last few years was supposed to be incurable. For a great many years doctors pronounced it a local disease, and prescribed local remedies, and by constantly failing to cure with local treatment, pronounced it incurable. Science has proven catarrh to be a constitutional disease, and, therefore, requires constitutional treatment. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, Ohio, is the only constitutional cure on the market. It is taken internally in doses from 10 drops to a teaspoonful. It acts directly on the blood and mucous surfaces of the system. They offer one hundred dollars for any case it fails to cure. Send for circulars and testimonials. Address, F. J. CHENEY & CO., Toledo, O.

# HENS AND EGGS

Undoubtedly there are many readers of **AMERICAN GARDENING** who keep hens who do not take a poultry paper; possibly some take the wrong one. Gardening, fruit culture and poultry keeping dovetail together perfectly, each filling a season comparatively dull in the others.

Realizing the above facts, we have arranged with the publishers of **POULTRY MONTHLY**, to offer that journal in club with **AMERICAN GARDENING**, for the coming subscription season, both journals postpaid, one year, for the **SMALL SUM OF \$1.25.**

**POULTRY MONTHLY** Is now in its nineteenth year; it has always been recognized as the leading publication in its particular field. Sound and reliable in its teachings, and not the mouthpiece of cranks, cliques, or rings. Its correspondents are practical and successful men, in the harness to-day. The publishers of **AMERICAN GARDENING** recommend *Poultry Monthly* as being one of the very best poultry papers issued, and advise all interested to accept this Great Combination Offer.

**A WONDERFUL OFFER!**

**American Gardening** (Weekly), \$1.00 } Both \$1.25  
**Poultry Monthly**, " " 1.00 } One Year, postpaid.

Present subscribers who are in arrears must pay up in full to become eligible to this offer.

Address **AMERICAN GARDENING, P. O. Box 1697, New York City.**

## Use o Old Plaster.

"Will you please tell me whether plaster taken from an old house is of any use in the garden?"—M. J. B.

—Old plaster or lime rubble is always good to use, especially on heavy clay soils.

## Pa m Out-growing its Tub.

The root-ball of a *Livstona*, sixteen years old, has outgrown the limit of its tub; can its size be safely reduced two or three inches or so all around? The leaf-tips die, otherwise it is apparently thrifty.—D. U. X.

—Palms recent injury to roots perhaps more than do any other plants. If it is possible to reduce the ball of earth without injury to the roots, you may do so; otherwise to move into a larger tub is all that can be done.

## Propagating Althæas.

By an unfortunate accident the paragraph in last issue which appeared under this head was incorrectly placed. The advice there given refers to peaches. Althæas are propagated by cuttings of the ripened wood.

## Cuttings Not Striking.

What is wrong when hardy cutting callus and then rot instead of forming roots?—QUEENS CO.

—Probably the wood was not right, or the ventilation was bad, or too strong a light was given, so that the tops wilted, or it may be all these causes combined.

## Trees for Shipping.

Will you give an amateur some plain directions for preparing young fruit trees for shipping to endure two or three days out of the ground? Can the branches of such trees be washed to remove insect eggs, etc., of aphids, which terribly infested them last Summer, that the pest be not carried to new quarters? With what substance?—QUEENS CO.

—The principal point in preparing and shipping fruit trees is to avoid having the roots so exposed that they will get dried. After removal from the ground carefully wrap the roots in moss if possible and see that they are not exposed to winds or sun. Branches and roots may be trimmed according to fancy. If the trees can be handled, give a good dressing with whale-oil soap, kerosene emulsion, or fir-tree oil.

## Fruit Trees Suckering.

Do you know the reason for fruit trees ceasing to grow otherwise than by vigorous sprouting from the roots?—QUEENS CO.

—The trees must be in poor health generally, and possibly the stool on which the trees are grafted has begun to grow on its own account, hence the suckers. Dig around the roots, removing all offsets and enrich the soil at the same time.

## For Winter Vegetables.

When is the proper time to prepare and sow vegetable seeds in hotbed for winter use?—A. L.

—Consult our vegetable calendar, given in the issue for April 8, or mention specifically what vegetables.

## Celeriac.

What treatment does celeriac or Knob celery require?—A. L.

—Celeriac being only a varietal form of ordinary celery, requires the same cultural treatment. For storage during winter it is better, however, to lift and place the root in damp sand.

## Plants Named.

(To H. W. M.)—*Aegopodium podagraria*.

(To W. Swan).—1. *Gentiana angustifolia*; 2. *Lycium barbarum*.

(To J. H. C.)—The plant from which the berries are taken is the well-known *Viburnum opulus*—Snowball tree, and is useful as a decorative shrub.

## FREE \$150.00 IN CASH.

We print here a list of words. They are sets of letters jumbled together, from which can be made the name of 8 cities in the United States. For instance, CQOIHAC can be transposed into Chicago, and so on down the list. We will give:

First Prize in Cash—\$50.00 to ten persons first sending correct answers.

Second Prize in Cash—\$50.00 to next 20 persons sending correct answers.

Third Prize in Cash—\$50.00 to next 50 persons sending correct answers.

Should more than the required number send correct answers, the awards will be made according to date letter is mailed, hence it is advisable that your letter should be among the first. You can win one of these prizes if you are quick and use your brains. The above rewards are given free as an inducement to read *New Ideas*, a handsome 16-page illustrated journal covering an entirely new field. It gives information about the latest inventions and progress in science, illustrating the most striking novelties for business and household use. Its subscription price is the only cheap thing about it. Send answer to-day!

OUR CONDITIONS.—You must send with your answer 25 cents (stamps or silver) for a Six Months' Trial Subscription to *New Ideas*.

### ALL SURE OF A PRIZE.

Aside from the prizes above named, we will give a special prize to each person who sends an answer, whether correct or not, provided that 25 cents in silver or stamps be sent for a six months' subscription to *New Ideas*. These special prizes are awarded along the line of Novelties, Music, Decorative Art, History and Fiction. Be sure to state in letter which you want. This contest will close Saturday, Oct. 30th, and names of prize winners will be announced in Dec. number of *New Ideas*. Address, *New Ideas*, Sta. K-148, Philadelphia, Pa.

Mention American Gardening when you write.

## WHOLESALE MARKETS.

### New York.

During the past week the tendency of the market in all directions has been in the favor of the producer. Prices have ruled high and especially is this true of apples, pears, and potatoes. On the other hand, buyers show a great reluctance to purchase stock at the prices quoted, yet if they want the goods, they have to come up to those figures. This condition of the market has naturally caused no little excitement on both sides, and it looks as though there is to be a spell of satisfaction to the farmer.

Mushrooms are now beginning to arrive, but as yet the trade on them is not specially good; however, it is expected it will pick up in another week. Other hot-house stock is not yet arriving, but is looked for daily.

Receipts of apples are light and of irregular quality. Really prime to fancy lots of desirable varieties—especially red kinds—are scarce and wanted. Under grades still quiet, but not over plenty. Fancy large clean Bartlett pears in fair demand and firm; poorly kept fruit dull and irregular. Fancy Seckle firm. High grades of desirable later sorts sell fairly well, but common kinds and poor qualities of all sorts drag heavily.

Peaches were not over plenty, but the demand lacked life and the movement was rather unsatisfactory, especially on medium and lower qualities. Very fancy held to fairly steady prices, but there were few such; most sales of Jersey baskets ranged 30@60c., culls going lower; the best prices are realized on Hudson River stock. Delaware grapes rather quiet and a shade easier; quotations cover most sales though a few extra lots both from western New York and up-river, brought a slight premium. White grapes quiet. Black rather firm for choice qualities.

A few quinces arrive for which there is a fair call.

Cranberries are meeting rather more attention from local dealers and prices are held with confidence though the outlet is not yet sufficient to cause any advance from late quotations.

Apples—Soft red table sorts, fancy, d.-h. barrel, \$3@3.50; red sorts, fair to good, per barrel, \$1.75@2.50; Holland Pippin, hand-picked, d.-h. barrel, \$2@2.50; Fall Pippin, hand-picked, per d.-h. barrel, \$2@2.50; Twenty-Ounce, hand-picked, per d.-h. barrel, \$2.25@2.75; Blush, hand-picked, per d.-h. barrel, \$2@2.50; King, hand-picked, per d.-h. barrel, \$2.25@3; Greening, hand-picked, per d.-h. barrel, \$1.50@2; Baldwin, hand-picked, per d.-h. barrel, \$1.50@2.25; mixed varieties, fair to good, per barrel, \$1.50@2; Virginia, selected red, choice, per barrel, \$3; Virginia, average prime, per barrel, \$2@2.50; Virginia, mixed kinds, ordinary, per barrel, \$1@1.50; Jersey, winter, open heads, \$1@1.25; Crab apples, small, choice, per barrel, \$2@3; Crab apples, large, per barrel, \$1.50@2.

Peaches—Maryland, fancy, table sorts, carrier, —; Maryland, Smocks, per carrier, \$1@1.25; Maryland, Clings, per carrier, 75c.@1.12; Jersey, extra, selected, per basket, 75@90c.; Jersey, selected, choice, per basket, 50@60c.; Jersey, fair to good, per basket, 30@40c.; Western New York, per carrier, \$1@1.75; up-river, carrier, 2 pony-baskets, 60c.@1.25.

Pears—Bartlett, large, clean, per barrel, \$3@4; Bartlett, poor to fair, per barrel, 75c.@2.50; Seckle, per barrel, \$2@4; Beurre Bosc, per barrel, \$1.50@2.50; Beurre d'Anjou, per barrel, \$1.25@1.75; Sheldon, per barrel, \$1.25@1.75; Beurre Clairgeau, per barrel, \$1.25@1.50; Swan's Orange, per barrel, \$1.25@1.50; other late sorts, fair to good, per barrel, \$1.25@1.50; common kinds, per barrel, 75c.@1.

Quinces—Apple, good to prime, per barrel, \$2.50@3.

Grapes—Delaware, western N. Y., per small basket, 10@11c.; Niagara, western N. Y., per small basket, 9@10c.; Pocklington, up-river, per 24-pound case, 50@

70c.; Worden, western N. Y., per small basket 8@8½c.; Concord, western N. Y., per small basket, 8c.; black varieties, up-river, per 8-pound basket, 11@13c.

Wine grapes—White kinds, in trays, per pound, 1½@2c.; Delaware, in trays, per pound, 2@2½c.; black kinds, in trays, per pound, 1¼@1½c.; black kinds in barrels, per pound, 1@1¼c.

Plums—German prune, 8@10 pound basket, 20@30c.; large blue, State, per 8@10-pound basket, 20@25c.; Gage and Reine Claude, State, 8@10-pound basket, 20@25c.; Damson, up-river, per crate, 50@60c.; Damson, per 8@10-pound basket, 20@25c.; ordinary kinds, sound, per basket, 12@15c.

Cranberries—Cape Cod, fancy, dark, per barrel, \$5.50; light, per barrel, \$3.50@4.

Receipts of onions are still moderate. Trade is quieter owing to the Jewish holidays, but choice stock of all kinds is firmly held. Inferior qualities moving slowly, but there is no burdensome supply of any grade. Orange Co., red, prime, per bag, \$1.75@2.25; Orange Co., yellow, per bag, \$1.25@1.75; Orange Co., white, per bag, \$1.50@2.25; Orange Co., inferior, per bag, \$1@1.25; Jersey and Long Island, yellow, per barrel, \$1.50@2; state and western, yellow, per barrel, \$1.25@1.75; eastern, white, per barrel, \$3@3.50; eastern red, per barrel, \$2.25@2.50; eastern, yellow, per barrel, \$1.75@2.25; small, white, per barrel, \$3@3.50.

Green corn dull unless of extra quality; a little such sold up to \$1.50, but most sales were at about \$1@1.25. Lima beans firm for choice.

Tomatoes in light supply; choice quite scarce and firm, but few lots command our top quotation.

Celery—Choice, large, per dozen, 25@35c.; fair to prime, per dozen, 15@20c.; small and poor, per dozen, 5@10c.

Cauliflowers—Fancy, per barrel, \$2@2.25.

Corn—Per 100, 60c.@\$1.  
Cabbages—Jersey and Long Island, per 100, \$4@5.

Cucumbers—Shelter Island, per barrel, \$1.50@2.50; selected, per 100, 75c.@\$1; pickles, state, per 1,000, \$1.50@3; pickles, poor to fair, per 1,000, 50c.@\$1.

Carrots—Washed, per barrel, \$1.75@2.

Egg plants—Jersey, per barrel, 75c.@\$1.

Green peas—Long Island, per bag, \$1.25@1.50.

Lima beans—Jersey, Potato, per bag, \$1.25@1.50; Jersey, flat, per bag, 60c.@80c.

Lettuce—Per barrel, 50c.; eastern, per dozen, 20@25c.

Squash—Hubbard, per barrel, 75c.@1.25; Marrow, per barrel, 60@75c.

Tomatoes—Choice, round kinds, per box, 75c.@\$1; ordinary, per box, 50c.@75c.; Albany, per bushel basket, 60c.@\$1.

Turnips—Russia, local, per barrel, 50@75c.; Russia, Canada, per barrel, 75@80c.

The week opened with very moderate receipts of potatoes. Sales of prime state stock have reached \$2.75@3, and fancy Long Islands have been placed even a shade higher. There was an effort to reach \$3 for choice Jerseys, but only a few of exceptional quality could be moved above \$2.75. Albany receipts light and prices firm. Market steady; most sales at \$1.62, some ordinary going at \$1.50, and a few fancy at \$1.75. Long Island, in bulk, per barrel, \$3@3.25; Jersey, per bag, bag included, \$2.65@2.75; choice round, in bulk, per barrel, \$2.75; fair to good, in bulk, per barrel, \$2.50@2.62; Albany and Troy, in bulk, per barrel, \$2.62@2.75; Western New York, per 180 pounds, \$2.75@3; sweet potatoes, Vine-land, per barrel, \$2.25@2.50; south Jersey, per d.-h. barrel, \$2@2.25; yellow sweets, Virginia, per barrel, \$1.50@1.75.

### Philadelphia.

Arrivals of apples have been small and there has been a good demand for choice fruit at firm prices.

Peaches have been in moderate supply, and fine fruit sold fairly well. Clingstone, however, were dull and had to be worked off at low rates.

Pears have been scarce and prices are firm with a good demand.

Plums and grapes have both been in

moderate supply, and are firmer, with good demand for choice fruit.

Apples—Maldens' Blush, per barrel, \$2.25@2.75; Gravenstein, per barrel, \$2@2.50; Twenty-Ounce Pippin, per barrel, \$2@2.50; mixed varieties, choice, per barrel, \$1.75@2; fair to good, \$1@1.50.

Peaches—Mountain fruit, per 5-basket carrier, \$1.25@1.50; per five-eighths bushel basket, 75c.@\$1; per 20-pound basket, 60@70c.; fair to good, 40@50c.; Clingstones, per 20-pound basket, 25@30c.; Jersey fruit, choice, per one-half bushel basket, 40@60c.; fair to good, 25@30c.

Pears—Bartlett, choice, per barrel, \$3@3.50; fair to good, per barrel, \$2.25@2.50; Seckel, per barrel, \$2.75@3.25.

Plums—N. Y., per 6-pound basket, Damsons, 18@20c.; Riene Claude, 18@20c.; Prunes, 18@20c.

Grapes—Hudson River, per 20-pound case, 40@50c.; N. Y. Concord, per 5-pound basket, 7@8c.; per 10-pound basket, 12@14c.; N. Y. Delaware, per 10-pound basket, 12@14c.

Cranberries—Cape Cod, per barrel, \$4@5.

Watermelons—Extra, per 100, \$15@20; seconds, \$8@10.

Muskmelons—Jersey, per barrel, 75c.@\$1.25.

Celery—Choice, large, per dozen, 25@40c.; fair, per dozen, 15@20c.

Corn—Jersey, per 100, 75c.@\$1.

Cabbages—Jersey, per 100, \$3@4.

Cucumbers—Per barrel, 60c.@\$1.

Egg plants—Jersey, per barrel, 60@80c.

Lima beans—Per 100 pounds, \$2@2.50.

Green peas—Marrows, choice, per bushel, \$1.25@1.40; medium, per bushel, \$1@1.20.

Onions—Jersey, white, per barrel, \$1.50@2; Jersey, mixed, per barrel, \$1@1.75; yellow, per barrel, \$1.25@1.75; Pennsylvania, yellow, per barrel, \$1.50@2.

Peppers—Jersey, per barrel, 75@90c.

Squash—Hubbard, per barrel, 80c.@1.25.

Potatoes—Choice, per basket, 50@75c.; fair, 30@40c.

Potatoes—Per bushel, 60@68c.; fair to good, 40@50c.; per basket, choice, 80@40c.; culls, per basket, 15@20c.; Jersey sweets, choice, 80@35c.; seconds, 15@20c.

### Boston.

Apples are very scarce, and consequently old-time prices rule, but the variety of fruit is of the new order. Bulk of receipts coming from far West. Spies or Ben Davis having color easily bring \$2.75@3; Jonathans \$3.75@4; Greenings \$2.75, whether from New York state or from Missouri; Nova Scotia Gravensteins \$4.50; odd varieties of Illinois and Missouri stock \$2.25@2.75.

Cantaloupes and melons about out of the market, there are enough of either kind, however, to supply the demand which is decreasing like the product.

The fancy grades of corn have ceased, and the stock offered for sale is of the general farmers' runs, all descriptions, and bring about 10c. a dozen.

The first hothouse tomatoes of the season come to light this morning; very fine and solid bring \$4 per bushel quicker than the fine field stock at \$1.50 a bushel.

Medium field stock sells \$1@1.25.

Celery, better demand; likewise better quality, 75c.@\$1.25 a dozen.

More artichokes offered, \$1.25@1.50 a bushel.

Beans, steady; limas, \$1.50 a bushel; Sievas, \$1.50@1.75; Agricultural and that kind, \$1 a bushel.

Cauliflower, 8@15c. per head.

Hothouse cucumbers, 4@6c. apiece; stock very fine.

Few hothouse grapes appearing; light demand because of the large quantity of outdoor stock, probably the average amount obtained equals about 25c. a pound.

Cranberries are firmer, \$4.50@5.50 a barrel; very little call for egg plant; peppers range from 50@70c. a bushel.

Onions are higher, \$2.25 in large barrels, \$2 for Ohio barrels.

A better call for squash; marrow, \$1@1.25 a barrel; Hubbard, \$1.25@1.50;

THERE is no getting away from the fact that Pure White Lead (see list of brands which are genuine) and Pure Linseed Oil make the best paint.

Properly applied, it will not chip, chalk or scale off, but will outwear any of the mixtures offered as substitutes. It is, therefore, by far the most economical.

**FREE** By using National Lead Co.'s Pure White Lead Tinting Colors, any desired shade is readily obtained. Pamphlet giving valuable information and card showing samples of colors free; also cards showing pictures of twelve houses of different designs painted in various styles or combinations of shades forwarded upon application to those intending to paint.

National Lead Co., 1 Broadway, New York.

Mention American Gardening when you write.

Turbans, \$1.50; Bay State, \$1.50; the only difference between this latter squash and the Turban seems to be the color of the shell.

Better demand all around for pears; very few choice; stock generally running small sized; Seckles, \$1@2 a bushel; fancy Boussocks, \$1@1.25; Sheldons, \$1@2; receipts light; Congress, a very large pear, \$1.50@2; Paradis d'Autonne, \$1@1.50; Beurre Bosc, \$1.50@2.50; speculators taking out few of cold storage Bartletts, the finest will bring \$2 a bushel.

The only peaches appearing this morning are from Massachusetts and New York; in the five-eighths basket, Massachusetts bringing 75c.@\$1.50; Hudson River stock in same basket, very fine fruit, \$1@1.80; while western New York offers some very good peaches in 12-quart baskets, which bring 50@75c. a basket.

Mint, 40c. a dozen bunches; lettuce, 8@12c. a dozen; parsley, 50c. a bushel; cabbages, a shade better, 4@6c. a head; carrots, \$1@1.25 a bushel; turnips and beets, 50c. a bushel.

Potatoes, easier; receipts quite heavy this week; and at the railroad, 70@80c. are prices obtained; while at the market about 10c. higher per bushel. Sweet potatoes very short, rainy weather not permitting digging, they have therefore been moving very quickly at \$2 a barrel.

Delaware grapes in pony baskets, 10c.; Concord, Wordens, or Moores, 8@9c.; a few Concord in large basket bringing 18c.

Plums have sifted down to two varieties; Damsons in 10-pound basket bring 30@40c., while the Greengage or Reine Claude being in very large supply, sells at 25@30c.

For the benefit of our readers it may be

added that a few Colorado Gems come over daily from New York, bringing \$4 per crate, and certainly those Gems made their record this year; their flavor is excellent.

One firm in this city has handled over 3,000 Montreal melons in the past 30 days, taking a range of price from \$1 to \$3 each.

Cucumbers for pickles are climbing to the highest prices for many years, selling \$4@6 per bushel.

The Everbearing is the name of a new peach introduced by Mr. Berckmans. The name is given because it is claimed that the fruits begin to ripen the first of July, and the tree continues with successive crops until early in September. The fruit is creamy white in color with light purple blush; flesh white, with red veins, freestone, and of first-class quality. Mr. Berckmans recommends it as a very desirable peach for the amateur, but not as having any specially good qualities to grow for market.

**JAPAN PLUMS** Large stock of best varieties at lowest rates. Full assortment of Trees and Plants. Get our prices before ordering elsewhere. Catalogue free. Established 1899. 150 acres. THE GEO. A. SWEET NURSERY CO. Box 1848, Danville, N. Y. Mention American Gardening when you write.

**A BARGAIN** ONLY \$1.60 We have made arrangements to furnish THE OHIO FARMER of Cleveland, O., and AMERICAN GARDENING, both papers, one year, making a total of 104 great papers, for only \$1.60.

**THE OHIO FARMER** is well known as one of the very best, largest, and in every way the most desirable weekly agricultural journal of this country. It is clearly the LEADER of the Agricultural Press of America. A 32-page, 6-column paper EVERY WEEK in the year; can buy THE VERY BEST WRITERS that money can produce; a strong, fearless defender of the agricultural interests of the country, and CLEAR in both reading and advertising columns. IT HELPS MAKE THE FARM PAY. SAMPLE COPIES FREE. Present subscribers can order this combination at once and have their present term of subscription to AMERICAN GARDENING extended for one year. New subscribers to THE OHIO FARMER will receive the rest of this year free. Address all orders, AMERICAN GARDENING, P. O. Box 1697, NEW YORK.

## ALL ABOUT THE HOME PLOT

## POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## Admission to the Standard of Excellence.

Fancy and utility have been so strongly at war that one genius proposes that they unite on a common platform to be known as "beautility." It seems doubtful that the war of words will influence the association greatly. The preliminary committee have united in refusing admission to the standard to the breed known as the White Wonders. The Indian Runner duck seems likely to be admitted. The White Wonders have scores of pushing friends, whereas few are familiar with the duck above-named. It is thought, however, that these white fowls, fine though they be, are too nearly like some present standard breeds.

## Breaking Up Litters.

Quite positive in their ideas are the motherly birds whose minds run to incubation at this season. Do not let them waste time. If a sitter is doomed to grace the festive board, let it be before she has been sitting a month, as Johnny claims the last one did. The longer a fowl sits, the less wholesome will the flesh be, and the smaller will be the proportion of fat. Upon this proportion (in lieu of butter) often depends the fullness of the gravy bowl. Let not the small boy be defrauded thus by useless and wasteful incubatory preliminaries to the feast of St. Dominick. Rather let immediate decapitation "break up" the sitters.

## Ambrosia for Greenery.

One of the prettiest things for pots, when it can be well grown, is the Ambrosia, with its delicate fringed spikes. It is a dainty green for bouquets, its chief defect being the stiffness of the spike itself. Sometimes, however, it obligingly grows in curved sprays, which makes it slightly more amenable to graceful arrangement. With training of the right sort, the spikes can be made to take on curves, and other dispositions more graceful both for pot plants and for cutting than the natural upright form. It is an interesting plant, to such especially as are not familiar with its thickly clustered bud and bloom of neutral green tint.

## Unusual Indoor Plants.

Among the subjects to be more vigorously pushed (by dealers) for winter use are Irises and Gladioli. The various groups of both have been improved and increased till even the most critical tastes must be pleased, even if not yet satisfied. It must be remembered when effort is to be made to grow new window subjects, that those which like coolness and mois-

ture outside will crave it inside also. Those fond of heat outside will like it indoors also; but often not in the same degree. This last is the more likely to be true if the indoor heat is dry.

## A Delightful North Window.

It was a spacious one, else there might have been a different story to tell, and had it not been arranged with reference to the street and the passers, rather than to the inside effect, it must have been less beautiful than it was in actuality. Next the broad plate glass was an entire row of Geranium, *Mdme. Sallerol*, with much white edging and variegation. Farther back, and quite far apart were a tall *Calla* and a large *Begonia* of the Castor-oil-bean type, if one may so express it. Among and around these, as a sort of carpet were many white Chinese *Primulas* of the best sorts. A handsome *Rex Begonia* swung in a basket at a central point, while vines clambered and trailed up the wall at the right and left. The waxen leaves of *Begonia Feastli* hugged and overran one large pot, and tall *Cloth-of-Gold Geraniums* backed the collection. The window was almost wholly a study in green and white. With plenty of light and space, every plant thrived royally, and passers-by made frequent halts and inquiries as to the secrets of the successful grower. That busy woman smiled a reply, to the effect that besides the alchemy of sunlight (not sunshine) and air, the only secret was adaptation of plants to necessary conditions.

## Yellow in Hybrid Teas.

This is, of course, greatly to be desired. A new candidate, *Mlle. Helena Cambler*, is announced as a decided advance toward a true, yellow, hybrid tea. It is a more heavily charged with pink than some other sorts, being salmon with rose and apricot-yellow at first, and rosy flesh with deeper center when well opened. This hardly sounds so much like yellow as *Mdme. Pernet Ducher*, which, though pale, is yellow, or creamy-yellow, throughout.

## Eggs for Export.

"What a shame that we are still importing eggs into this country by the hundreds of dozens," protested a surface thinker, one day last week. This individual knew the one fact of import, but not the correlative fact that our reported exports of eggs are larger than our reported imports. Probably too no thought was given to the fact, that large numbers, both of exports and imports, are fancy stock for hatching purposes.

## A New Emile de Girardin.

For years, the old *Geranium* standby, *Emile de Girardin*, was considered

unapproachable. Even of late, some firms have been bringing it out of the retirement whither it had been pushed by ambitious, new sorts. A new offering known as *Francis Perkins* finds its best grasp at public attention to be in its resemblance and claimed superiority to *Girardin*. It is announced as the best bedder (of this fine, bright, clear pink) known up to date, for our climate. Sun-resistance, prolificacy, and fine color for massing are its stronger points.

## Color in Typical Fowls.

Many people who attend poultry shows feel—and many of them do not hesitate to say—that they have as good, or better, birds at home. Such do not realize that a bird may be excellent as to general appearance, but very faulty when closely scrutinized; nor do they remember, if indeed they ever knew, the part that purity of color plays in standard requirements. In *White Leghorns*, for instance, how many cocks do we see outside the shows that have not a tinge of yellow to the plumage? Yet it is the snow-white bird that takes the first prize, while if there are any feathers other than white in any part of the plumage, the bird carrying them cannot make its appearance in any standard show at all. Neither can it do so if it shows red earlobes, or shanks other than pure yellow in color.

In the *Buff Plymouth Rocks*, the best birds must not only be buff in outward appearance, but they must be of a rich, deep, clear buff, uniform throughout, except in the tail of the cock, which may deepen towards brown. The portion of the feathers which does not show must also be pure buff, and that clear to the skin.

The *Black Langshan* must not only be black, as the general observer sees it. If it shows white or grey in any part of the plumage except the foot feathering; if it have yellow skin, or even if the bottoms of the feet are yellow, it cannot be shown. But if it pass muster on all these points, and get in, the judge will inquire as to the color of its eyes, its beak, its comb, wattles, and earlobes, as well as of its feathers. And if he is to give it a first prize, he will want it to have, not only pure black outside feathering, but he will ask that the under color also be black, or dark slate. And he will not be thoroughly pleased with the bird, though every feather be black, unless a large proportion of the sections are finished with glossy, greenish sheen. If all this be true of birds of solid color, what shall be said when the standard requires one section of the feathers to be pencilled, others to be edged, others to be of solid color, and the under color to differ from all the rest, as in the case of some parti-colored breeds?

MYRA V. NORTON

NOW READY.

## The Water Garden

BY WILLIAM TRICKER.

PRICE, \$2.00. 25 per cent. off to subscribers to American Gardening and Florists' Exchange.

This work contains nine beautiful plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work.

On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

A. T. DELA MARE PTG. & PUB. CO. LTD., Nos. 2 to 8, Duane Street, P. O. Box 1697, New York City.

## Quality in Sweet Corn.

It is most unfortunate that quality is so seldom considered in connection with sweet corn. The market demands fine "roasting" ears, neither too old nor too young, and so long as the husks keep a bright green color and the ears are large, it is rated as A1 corn and brings the top price. From the standpoint of profit, probably Stowell's Evergreen is the best corn to plant for market, but it is certainly inferior in quality. I had a small field of Squantum or Potter's Excelsior. The quality excelled that of any corn I ever raised, but it was difficult to get my customers to appreciate it. They seemed wedded to the idea of getting big ears. There is an ample field for missionary work in cultivating the taste for sweet corn, and we may yet see the announcement in our leading restaurants "Rhode Island Sweet Corn," as we now have Rockaway oysters.—G.

## When to Move Roses.

I have ten fine large Rose bushes of Jacqueminot, John Hopper, and Marshall P. Wilder, which have grown so big that I shall be obliged to move them. Can these plants be transplanted without danger?—W. Y. W.

—The Rose bushes can be moved without the least risk when they are dormant. If you can find the soil in good condition and free from frost one day in December, transplant them; otherwise move the plants in very early spring. But if possible the first-mentioned season is the better one.

## American Fruit in London.

Within nine hours after the docking of the American line steamship St. Paul, 4,408 packages of California fruit were delivered at Covent Garden Market, London, in splendid condition, and were all sold that morning. The California pears realized 4s. 6d. to 12s. per half box, blue plums were sold for 5s. 6d. to 6s. 6d. per half box, and yellow plums brought 8s. to 12s. per half box. The market was somewhat depressed on account of the quantity received.

Gooseberry and currant bushes should be transplanted in the fall.

There is a brisk demand for apples for Canada despite the duty.

# BARGAINS

In PLANTS and BULBS for Winter and Spring Blooming.

Holland grown, largest size HYACINTH bulbs, 45c. a dozen, in separate colors.

For 50 CENTS we will send postpaid any of the following collections, each plant or bulb labeled.

No. 3.—13 assorted Double VIOLETS for winter blooming.

No. 7.—25 giant assorted PANSIES for winter blooming.

No. 10.—10 Everblooming ROSES for winter blooming, all different.

No. 11.—13 Everblooming ROSES for outdoor planting.

No. 12.—6 Everblooming ROSES and 6 GERANIUMS.

No. 20.—13 single and double HYACINTHS, labeled.

No. 20.—50 Giant FREESIA Bulbs.

No. 21.—8 LILIUM bulbs, all different.

No. 21.—50 assorted TULIPS.

No. 22.—6 large CARNATION plants, ready to bloom, all different.

Our Illustrated Catalogue of Bulbs and Plants will be mailed to any address upon application. Our aim is to please our customers and we seldom fail. Our prices are as cheap as consistent with first-class stock. If you want beautiful flowers, and lots of them for a small amount of money, see our catalogue. Write for it to-day. Satisfaction guaranteed.

# OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

# YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

**T**HROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessed of the story of the life and cultural methods of **Henry Jerolaman**, undoubtedly the **STRAWBERRY KING OF THE UNITED STATES**. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us **One hundred thousand plants of the HENRY STRAWBERRY**, to be used solely as premiums to subscribers to AMERICAN GARDENING. The Henry Strawberry has positively never before been advertised.

THE CONTRACT

*Publishers American Gardening.*

*Gentlemen,*

*I hereby agree to furnish you within the next twelve months in quantities as ordered, One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums to subscribers to American Gardening and not to be sold.*

*Witness*

*Thos. D. Anthony.*

*(Signed)*

*Henry Jerolaman*

## The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

## A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one strawberry grower in every town, village and hamlet can come into a good thing through practising the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

## Taking Advantage of Our Offer:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid.

**FIVE PLANTS** ..Of the.. **HENRY STRAWBERRY**  
Unequaled

And AMERICAN GARDENING One Year.

Present Subscribers are entitled to this Offer on renewal; if their subscription has not expired, it will be dated ahead.

Plants to be shipped this Fall or in the Spring, as you prefer.

**OFFER EXTRAORDINARY** For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, Five Plants of HENRY STRAWBERRY; at the same time we will also send Five Plants to the party subscribing through you. Thus a club of 10 new subscribers entitles you to 50 plants of this wonderful Strawberry, as well as each individual subscriber to 5 Plants. This is a BIG OFFER to all who want to become larger holders of this wonderful Berry, never before advertised. Time is short, get to work to-day.

Address **Publishers AMERICAN GARDENING, P. O. Box 1997, New York.**

# Trial Subscriptions

For \$1.00 we will send AMERICAN GARDENING on three months' trial (13 weeks) to four separate addresses, and as a premium, Five Henry Strawberry Plants to the one getting up the club. **HUSTLE.**

## Select Greenhouse Flowering Plants for Winter.

With tropical heat in the United States during summer time, we find conditions most favorable for the outdoor cultivation of a large number of plants, which must in a more temperate climate be nursed in greenhouses, or under sash outdoors. The greenhouse is one of the least attractive features of an American garden in summer time, but when autumn comes its charms increase, and it is never so interesting as when well-filled with autumn and winter blooming plants.

A remnant of a batch of tuberous Begonias remains, with a few seedlings yet to bloom; and these will furnish bright colors for some time to come. It will take a few weeks before the bulk of the plants which have been lifted gets established.

### *Browallia Speciosa* Major.

*Browallia speciosa* major has proved, both in winter and summer, one of the handsomest and most floriferous plants of recent introduction. Its irregularly rotate flowers of deep indigo blue are an inch across, standing out singly from the axils of nearly every leaf. The plant itself is of neat bushy habit, growing and blooming from a foot to two feet in height. It probably is an annual in its native country (?); it is best treated as such. Although cuttings root easily, they do not make as good plants. Planted outdoors for the summer, it takes up easily. Last winter I managed to cross its near relative, *Streptosolon Jamesoni*, with it. This is a shrubby species with orange colored flowers, but the seeds failed to germinate. Kenneth Findlayson, with Dr. Weld, of Brookline, has been more successful with the reverse cross, and he obtained a dozen or more seedlings. So far they resemble the parent, *Browallia*.

### *Chironia Oxifera*.

*Chironia oxifera*, another little-known plant, though not quite new, is likely to become one of our best pot plants for conservatory decoration at this season. It is sub-shrubby, and naturally makes a neat bush. The best way to treat old plants is to cut them back to secure fresh shoots from the stock. The whole plant assumes a glaucous hue. The leaves are small and lance-shaped. The bright rose, saucer-shaped flowers occur singly, on short stems, in the axils of the leaves. Quite an attractive feature of the flower is an upturned bunch of yellow stamens, characteristic of all melastomaceæ to which family it belongs.

### *Libonia Penrhosensis*.

One of the prettiest winter flowering pot plants we have is *Libonia Penrhosensis*, a hybrid between *L. floribunda* and *Jacobinia Ghiesbreghtiana*. It has much brighter and deeper colored flowers than its parent. It is a little evergreen bush with dark, glossy, ovate leaves, densely arranged. The flowers come in little bunches towards the ends of the branches. They are labiate, arching outwards as in the *Justicias*, to which family it belongs. They open orange colored, changing to fiery red as the season advances.

### *Caryopteris Mastacanthus*.

*Caryopteris mastacanthus* has established itself as a favorite for autumn flowers. It is a sub-shrubby member of the *Verbena* family, and a native of China. It is said to be hardy, but as far as our experience goes it is not quite so, being killed back so badly that wintered plants from frames make twice the growth that those left out do. They live, but are cut back to the ground. It has been called the blue *Spiræa*, though even this name will give but a faint idea of its appearance, except that its sky-blue flowers occur in bunches in the axils of its opposite leaves so densely as to give it a plume like appearance, and this effect is heightened by each flower having a fringed lower lip. An old plant or two, forced for the purpose of cuttings in spring time, will give hundreds of plants which will grow to a foot or eighteen inches high, making neat pyramidal bushes, and blooming well the same season. We are using it for bedding, and combined with scarlet *Salvias*, which

bloom at the same time, it is very effective. As a pot plant it is splendid for piazza decoration, at a season when there are few of its color.

### Snappdragons.

Snappdragons have come into favor for winter flowers, and the wonder is they have been neglected so long. Very little heat is required to keep them in bloom. They will do quite well in a house where *Mignonette* is grown. Selected plants may be perpetuated by cuttings, and in this way some very fine varieties have been secured. Elijah Wood's Medium White is the best known, and from it I have obtained an equally beautiful yellow. An acquaintance has a strong-growing white flowered variety with spikes from three to four feet long. Individual plants of these he found with sweetly scented flowers, and these have been selected for perpetuation.

### *Streptosolon Jamesoni*.

*Streptosolon Jamesoni* makes one of the finest shrubby greenhouse plants, especially when grown into standard form. It takes a year or two of careful training to get good heads. Plants with a clear stem of three feet droop back almost to the ground, and when covered with a mass of orange flowers it is remarkably effective. It will carry two crops in a season, with only a week or two between.

T. D. H., Mass.

## The Establishment of Public Parks.

The importance of bringing together information concerning the establishment of public parks cannot be illustrated to better advantage than it is in a little publication that has recently come to hand under the above title and relating to the New York park system, which was prepared by Mr. Gherardi Davis of New York and read before the Historical Society of that city.

After making a brief statement as to the necessity of public parks in cities and the desirability of guarding them against encroachments, he gives the history of the park movement in New York from the first suggestion that was made in a letter published in the New York Packet in 1785 and addressed to the mayor and aldermen of the city, calling attention to the fact that "there is not in this great city one proper spot where its inhabitants can enjoy with convenience the exercise that is necessary for health and amusement."

He then goes on to give the history of Bowling Green, the Battery, and the various squares and parks of the city, from the time they were first suggested until they were acquired by the city and developed as public pleasure grounds, giving many interesting historical and other incidents connected therewith.

It is difficult for one unacquainted with such matters to realize the amount of careful investigation that is required to bring together and verify such facts and interesting incidents as are related in this pamphlet, which should be the forerunner of similar publications in other cities, for the subject is well worthy of the careful investigation of students in local history, and such facts and incidents as are here brought together are not found in any other publications with the exception of the fragmentary and disconnected records in park reports and occasional newspaper and magazine articles.

There has never been made until very recently a systematic effort to bring together in any of the important libraries complete sets of park reports. Some park commissions even have not complete sets of their reports in their own offices, and almost every park commission is unable to supply many of its back numbers.

The Park and Outdoor Art Association are bringing together as complete a set of park reports and other material relating to outdoor art as can be obtained. Information thus brought together will be of the greatest value to all persons who are interested in the park movement which has come to be such an important question in the development of American communities. WARREN H. MANNING.

## How to Heat Greenhouses.

### Rules for Calculation of Pipe Area, etc.

For a small house it will generally be preferable to use hot water. In order to secure an even and economical heat, the piping should be carefully adjusted to the requirements and the heater should be of ample size and of such a construction as will enable it to utilize it to the fuel with the least possible loss.

In order to estimate the amount of piping required for a greenhouse, one must know the number of square feet of glass in the roof and walls, and to this should be added about one-fifth of the area of exposed walls other than glass. This being ascertained, it will be an easy matter to estimate the number of square feet of piping required to heat the house to any desired temperature.

If the house be well built and not unusually exposed to high winds, the following rule will answer in places where the temperature seldom goes below zero, with ten below as a minimum: For a temperature at night of sixty degrees use one square foot of pipe for each three square feet of glass, and increase or decrease the amount of glass that can be heated, one-half of a square foot for each five degrees that the temperature is to be varied from sixty degrees. Thus, for fifty degrees one square foot of pipe will heat four square feet, while it will only answer to heat two square feet of glass to seventy degrees.

To carry the water through the house and provide radiating surface, wrought iron pipe with screw joints is now most generally used. For houses more than seventy-five feet in length it will be best to use two-inch pipe, but in smaller houses one and one-half inch pipe may be used for the returns. Except in very small houses the flow pipes should not be less than two inches in diameter, and in some cases they may be still larger. Let us suppose that we have a house fifty by twenty feet, with 1,576 square feet of glass in the roof, sides and ends (including also one-fifth of the wooden wall exposed). To heat it to sixty degrees it will require 525 square feet of pipe. As it requires about two feet of 1½-inch pipe to give one square foot of radiating surface, it will take 1,050 linear, or twenty-one runs, of that size to afford the desired temperature. Using 2-inch pipe, one linear foot will afford .621 square feet of radiating and nearly 850 linear feet, or seventeen runs, will be required. For a house of this length one flow will answer for four returns of the same size, but if it is one hundred feet long the number of returns should be reduced to two for each flow. It will then require for the house under consideration four flows and thirteen returns, when 2-inch pipe is used, and five flows and sixteen returns when using 1½-inch pipe. Another method would be to use 2-inch flow pipes and 1½-inch returns, when four of the former and sixteen of the latter will be necessary.

While all the pipes may be under the benches, on the walls, or in the walks it will be better to have only the returns there, and to place the flows overhead where they can be distributed upon the posts supporting the roof. It is often a good plan to have one of the pipes, either flow or return, upon each of the plates. For most purposes it will be best to use the downhill system of

pling, having the highest part of the flow pipes at the end nearest the heater, carrying with them a slope of one inch in ten or fifteen feet to the further end, where they can be connected with the returns, which should also slope toward the heater.

It will be necessary to either place an air cock at the highest part of each pipe or to connect each of them with the expansion tank, which should be considerably elevated. In this way we shall have what is called an open system, which will be best for small houses. In order to control the temperature it is a good plan to have valves upon a number of the pipes.

L. R. TAFT.

### Cheap Greenhouses.

A greenhouse is indispensable to the man who intends to be first in market and secure the highest prices for his produce, and as an advertisement locally is worth more than the best newspaper ever published (although a progressive

permanent structure; self-feeding coal stoves can take the place of the more expensive methods of heating at the least expense of cost and labor. But! just here: did any one ever get anything honestly without labor? That labor question is, next to fertility and best seeds, the most important factor in gardening. A constant struggle with the survival of the "unfittest," weeds, bugs, etc., but the satisfaction of success is in knowing that the crop is as nearly perfect as is possible, and a little ahead of one's competitors. If all labor be hired the work will only be half done, or else the cost will absorb very nearly all the profit; the successful gardener does very nearly all the work himself, and it is no small amount either, for if not with his hands, it is by brains.

For a house without benches, the outside wall needs to be only twelve or fifteen inches in height, just enough to run a flue or pipes around. If built on the ridge plan, the apex should be 6 or 7 feet high in the middle; this will allow the house to be 30 feet wide, using 16

glass-bars with the pane of glass, to get the right width apart, and nail; do this with each bar, to overcome any inequality in size of bar; after all are on, close the ends of the house, put in the glass, and it will be ready for business.

Some of the advantages of such a house as here described are, its cheapness, it does not require any especial ventilation because not airtight, less danger of aphids or other insect enemies, and last but not least, being low, it can be covered with straw or leaves in case of extreme cold, saving a crop when more costly houses would lose by not being able to heat so much space. In case benches are wanted, the middle of the house can be used for that purpose. I have a house built on this plan, that has passed through zero weather, without losing the tenderest plants. The accompanying illustration shows it.

Md.

HENRY SNYDER.

### The Fruit Garden.

**Pears.**—As the season for picking pears draws to a close, it is well for us to scan our record of what we have had to draw upon, and to see with what kinds we could easily have supplied the demand; also if there were any blank noted, to find the best kind to fill that blank. Possibly there are some varieties we would like to drop, say such as are coming in with others of better quality. Note such and graft them in spring with a better variety, or else replace with some fruit that will be of more service, bearing in mind that a surplus of fruit is always to be worked for.

Our season of pears began July 21 with Beurré Giffard, a sweet little fruit of short duration; this was followed with Manning's Elizabeth, also small and of short season, but a dainty picture pear very good for home use, tree a stocky grower, benefited by manure, being very productive when so treated. Directly after it is Dearborn's Seedling, a medium-size pear, light yellow with small dots, of fine quality. This with Petite Marguerite of a fine quality and longer season, will land us into the Souvenir de Congrès and Bartlett season. It is surprising how long this season can be made by some judgment, in picking the best of the fruit twice a week. Buffum working in well with the late Bartletts if handled rightly, and it can be managed to extend its season for over a month. I said a good word for this pear in one of my earlier notes and I am using it now, September 30, to brighten up Sheldon, Seckle, and Flemish Beauty.

In this last I have touched on a tender spot; however handled, this can be but very seldom called a beauty in outward appearance, but with the help of Bordeaux, and early picking, it makes a fine eating pear.

Beurré Superfin is another peculiar pear, very productive, and very variable in flavor, and has to be picked, and eaten too, just at the right time, or nine out of ten will pass on it the verdict "poor," when it really should be very good.

For use in October we have Beurré Bosc, of very striking appearance, and flavor to match. It can be simply passed as a No. 1 pear. It was raised in 1807 and named Calabasse Bosc in honor of Mr. Bosc, a distinguished Belgian horticulturist. It was also sent to London under the name of Beurré Bosc, which name was retained to avoid confusion with the Calabasse, a pear of inferior quality. It, with Beurré Bosc we name Beurré d'Anjou, we have two of the very best pears for October.

**Planting.**—Push the work along and remember when planting large trees, that a heavy drenching of water will tighten the soil about the roots better than all the pounding, care being taken to fill in only enough soil to fill between or just cover the roots. Leave it until the water has drained away, then fill in without pounding.

J. HOLLOWAY, L. I.

FIG. 195.—A CHEAP GREENHOUSE.

gardener will keep a standing "ad" in the local papers).

Vegetable growing under glass has become an imperative necessity in order to compete with southern grown "truck." The avidity with which consumers buy the more or less stale, often half decayed stuff, and the prices they are willing to pay, can be utilized by any good gardener to his own advantage. Most persons have the idea that a greenhouse is a costly luxury, and requires an expert to manage one. But newer and cheaper methods are being brought into use daily, and any man or woman intelligent enough to grow good flowers or vegetables outside, is competent to run a greenhouse if so inclined. The thought has often occurred to me while looking at fine house plants in winter bloom, "What a splendid gardener that woman would make if she had proper facilities." They could have been had at a trifling cost. Glass is the principal cost in a cheap greenhouse, but with ordinary care it will outlast a lifetime; woodwork lasts two or three years, but it can be renewed more cheaply than the insect pests can be kept down in a more

foot strips and boards, without waste. The bars for glass can be grooved to slide the glass in, or lath can be nailed on, to form a resting ledge, and the glass lapped  $\frac{1}{2}$  inch, or butted, and prevented from slipping by the double pointed tacks; lumber can be used in the rough, thus saving the expense of dressing. Posts for the ridge need not be heavy, and strips run lengthwise can be propped to prevent the bars from sagging, in fact the "house" is simply a huge cold frame, heated with fire heat. Any person that can drive a nail, can build the house.

A good plan where the winter is severe, is to cut a ditch around the inside of the wall, below frost line, to carry the pipes in, but then be sure to have an outlet for any water that might accumulate in the ditch.

To build, set the posts for the ridge just as for a fence, 8 feet apart; cut tops square, and spike on a scantling. Take a glass-bar cut to the right length, beveled end; nail flush to ridge, set board up on edge and nail bar on top. Tack the other end of board the same, having everything square, measure the two ends of

## Autumn Leaves.

The casting of the leaf is not a sudden and quick response to any single change in environmental conditions, but is brought about with a complex interplay of processes begun days or perhaps weeks before any external changes are to be seen. The leaf is rich in two classes of substance, one of which is of no further benefit to it, and another which it has constructed at great expense of energy, and which is in a form of the highest possible usefulness to the plant. To this class belong the compounds in the protoplasm, the green color bodies, and whatever surplus food may not have been previously conveyed away. The substances which the plant must needs discard are in the form of nearly insoluble crystals, and by remaining in position in the leaf, drop with it to the ground, and pass into that great complex laboratory of the soil where by slow methods of disintegration useful elements are set free, and once again may be taken up by the tree and travel their devious course through root hairs along the sinuous roots, and up through million-celled columns of the trunk, out through the twigs to the leaves once more.

### Why Autumn Leaves Are Colored.

The plastic substances within the leaf, which would be a loss to the plant if thrown away, undergo quite a different series of changes. These substances are in the extremest parts of the leaf, and to pass into the plant body must penetrate many hundreds of membranes by diffusion into the long conducting cells around the ribs or nerves, and then down into the twigs and stems. The successful retreat of this great mass of valuable matter is not a simple problem. These substances contain nitrogen as a part of their compounds, and as a consequence are very readily broken down when exposed to the sunlight. In the living normal leaf the green color forms a most effectual shield from the action of the sun, but when the retreat is begun, one of the first steps results in the disintegration of the chlorophyll. This would allow the fierce rays of the September sun to strike directly through the broad expanses of the leaf, destroying all within, were not other means provided for protection. In the first place, when the chlorophyll breaks down, among the resulting substances formed is cyanophyll (blue), which absorbs the sun's rays in the same general manner as the chlorophyll. In addition, the outer layers of cells of the leaf contain other pigments, some of which have been masked by the chlorophyll, and others which are formed as decomposition products, so that the leaf exhibits outwardly a gorgeous panoply of colors in reds, yellows, and bronzes that make up the autumnal display. From the wild riot of tints shown by a clump of trees or shrubs, the erroneous impression might be gained that the colors are accidental in their occurrence. This is far from the case, however. The keynote of color in any species is constant, with minor and local variations. The Birches are a golden yellow; Oaks vary through yellow-orange to reddish-brown; the Red Maple becomes a dark red; the Tulip tree a light yellow; Hawthorn and Poison-Oak become violet; while the Sumacs and vines take on a flaming scarlet. These colors exhibit some variation in accord with the character of the soil on which the plants stand.

### Why the Leaves Fall in Autumn.

The plant is a most delicately self-regulating organism. It cannot increase the water-supply, but it may and does decrease the evaporating surface by casting or shedding the leaves, a reaction which it exhibits to other conditions as well. Like the true seaman, however, the plant does not shorten sail by cutting away its canvas, but, by a deliberate and well-timed series of processes, withdraws all of the substances from the leaf which may be useful to it back into its body before it discards the empty sheets of cells and woody fibres of the petiole and midrib. Before proceeding to a description of the mechanism of leaf-fall it may be well to call attention to the popular

and erroneous idea that the coloring and casting of autumnal leaves are due to the action of frost. It is true that the phenomena of autumnal leaf-fall are due to low temperatures, but, as may be seen from the above, the defoliation of the plant is not a reaction to the cold, but is an adjustment to the limited water supply furnished by the chilled roots. The reduction of the water supply and the beginning of the processes leading to defoliation occur a long time before the temperature of the air is depressed to the freezing point or the formation of frost. The influence of low temperatures upon the plant is illustrated by the manner in which leaves of tobacco and melon plants blacken and die as the result of cool nights before the occurrence of frost. These plants transpire a relatively large amount of water from the broad leaves, and if the temperature of the soil descends to 40 degrees Fahrenheit, the roots are unable to take up the necessary supply of water, and the leaves are literally dried out, though they are incorrectly described as frozen or frosted by gardeners.—D. T. MACDOUGAL, in Harper's Magazine for October.

## Chrysanthemums.

**Buds Are Swelling Apace** and so far as cultural methods go there will soon be little to do. Now is the time when varieties should be compared with previous years as to times of flowering, etc. A few notes are not much bother and are very useful for comparison.

**Feeding.**—Plants that have had much feeding will now take with safety liquid manure of almost any strength you like to give. Feeding should, however, be discontinued just as soon as the flower gets half way open or the petals will damp.

**Benches** should be kept only moderately moist now, and the flowers will finish much better in consequence. Don't dry them out by any means, but they do not now need the water they did a month ago.

**The Atmosphere** should always be dry and buoyant by nightfall and no matter how cold the night is, always leave on a little air at the top of the house. This will prevent the moisture from collecting on the petals, said moisture being always a fruitful source of damping. Give lots of air on bright days, and this will strengthen the neck of the flower and make it stand up stiff and sturdy. A weak-necked flower is disliked by every true chrysanthemum lover. It is an unnatural condition and any variety if properly grown and finished will hold itself erect.

**Thrip** may be making himself obnoxious just now. I don't know his full name though he is on visiting terms with me. He gets in the flower and manages to muss it up considerably in a short time. He seems to prefer whites and yellows, and if the flower looks stained and spotted he can almost always be found somewhere in the petals. Other times he will be found sitting on a bud waiting for it to show color so he can begin operations.

C. TOTTY, N. J.

## The Vegetable Garden.

**Turnips.**—The remark is often made that turnips can be grown only on new land; this evil can often be obviated by an application of lime plowed or dug into the soil. The trouble is caused by the larva of a small fly. To keep the garden clear of these, it is necessary to burn all refuse of turnips, especially those containing any of the maggots, thus destroying them. Such remnants of vegetables are often thrown to the hogs, or directly into the manure heap to rot, and everything does rot except the insects, and it proves to be only a comfortable home for them. When spring comes they are carefully carted back again to perpetuate the species in the garden.

**As the Crops are Cleaned Away** every fall, all refuse should be carefully collected and burned; this applies to all vegetation containing any trace of disease, as the blight on tomato vines,

mildew on pea haulm, asparagus disease, and so on; by burning all such rubbish, the habitations of insects and blights and eggs of insects are totally and irretrievably destroyed. It is a great mistake to dump such rubbish into the manure pile, as unquestionably this is the chief means by which these various diseases are perpetuated in the garden.

**Sour Land.**—Land that has a tendency to become sour and unhealthy will be benefited by a top-dressing of 1,000 pounds of fresh air-slacked lime per acre. This will not only correct any sourness in the soil, but will also kill many insect pests, and will aid in the decomposition of all vegetable matter the soil may contain, and thus improving its texture will benefit the crops. All land along the coast, or in close proximity to the salt air is particularly benefited by the application of lime.

**Fall Work.**—By proper attention and good work in the fall, better results can safely be expected the following year, than in the one passed. Land in an unhealthy and poor condition will never grow satisfactory crops, no matter how good the seed may be, how carefully sown, or what subsequent treatment may be.

W. M. EDWARDS, Conn.

## Catalogues Received.

[Readers are requested to mention AMERICAN GARDENING when writing for catalogues noted here. They are sent free to our readers except when otherwise stated.]

ALBERT M. HERR, Lancaster, Pa.—Price List of Pansy seed.

SCHLEGEL & FOTTLER, Boston, Mass.—Bulb Catalogue for Fall, 1897.

ALLEN L. WOOD, Rochester, N. Y.—Wholesale List of Nursery Stock.

A. & G. ROEBAUGH, Pemberton, N. J.—List of Plants and Rooted Cuttings.

J. M. THORNBURN & CO., New York.—Wholesale Trade List of Bulbs, etc.

SCHLEGEL & FOTTLER, Boston, Mass.—Wholesale Trade List of Bulbs.

THE PAGE SEED CO., Greene, Chenango Co., N. Y.—Bulbs, Plants and Seeds.

VICK & HILL CO., Rochester, N. Y.—Wholesale price list of bulbs, roots, etc.

P. J. BERCKMANS, Augusta, Ga.—Catalogue of Fruit and Ornamental Trees, Roses, etc.

E. H. KRELAGE & SON, Haarlem, Holland.—Bulb Catalogue for 1897, also List of Novelties.

PHOENIX NURSERY CO., Bloomington, Ill.—Wholesale Catalogue of Trees, Shrubs, Roses, etc.

FRED. W. KELSEY, 150 Broadway, New York.—Selected Hardy Trees, Shrubs, Bulbs and Plants.

WM. NELSON, New Orleans, La.—Price List of Trees, and a Practical Treatise on Pencil-growing.

DINGEE & CONARD CO., West Grove, Pa.—Catalogue of Bulbs, Roses, etc., profusely illustrated.

SCHLEGEL & FOTTLER, 26 South Market St., Boston, Mass.—Autumn list of Bulbs, Seeds, Plants, Shrubs, etc.

JOHN LEWIS CHILDS, Floral Park, N. Y.—Illustrated Fall catalogue of bulbs, plants, seeds and requisites.

DANIEL B. LONG, Buffalo, N. Y.—Floral Art Catalogue. This is a new stock catalogue for the use of retail florists.

W. & T. SMITH CO., Geneva, N. Y.—General illustrated catalogue of fruit and ornamental trees, shrubs, roses, etc.

HULSEBOSCH BROTHERS, Englewood, N. J.—Wholesale and retail catalogue of choice Dutch bulbs, seeds and plants.

J. M. THORNBURN & CO., New York.—Annual Descriptive Catalogue of Bulbs and other Flowering Roots for Fall planting.

R. M. WIGNERS & CO., San Antonio, Fla.—Wholesale List of Amaryllis, Orinum and Tubers; also, novelties in cactus, etc.

HENRY W. GIBBONS, 136 Liberty street, New York.—Price List of Tempering Apparatus for Removing the Chill from Water Used for Syringing.

GEO. A. SWEET NURSERY CO., Danville, N. Y.—Catalogue No. 2, classified list of Fruit Trees and Bushes, also Ornamental Trees, Shrubs and Vines.

S. TAPLIN, Detroit, Mich.—Circular regarding his new boiler, for which patents have been granted in America, Germany, Canada, Belgium, England and France.

ELLWANGER & BARRY, Rochester, N. Y.—General Catalogue of Fruit and Ornamental Trees, Shrubs, Roses, etc. Very complete, being one of the most valuable catalogues that comes to our desk.

## FRUITS OF EXPERIENCE.

## JOTTINGS FROM OBSERVATION.

If the young trees on your village lot are beginning to look dry, set the hose so that a spray of water will strike the underside of the leaves and let the water run for one hour to each tree. If there be only a few trees, spray one each day towards evening.

The person who is so smart as to do you a mean trick without any reason is not so sharp after all.

For the gardener who has a cow, horse, and chickens, it is as well to have all grain and other feed purchased and stowed away for the winter.

We should economize labor by doing all we can by machinery.

We must all have some of the Henry strawberry plants. (See premium offer.)

Sweet corn fodder for the cow should be cut before the leaves get too ripe.

We never want a man to plow for us unless his plowshare is kept sharp.

Rust eats up many dollars worth of tools each year.

away for use next summer, sorting out the soiled ones for kindling or vegetable plant boxes?

The failure of growing profitable crops of small fruits is often traceable to our neglect to give the necessary care.

The Swindle strawberry does not seem to come up to the claims made for it.

The weather has been extremely dry in southern Michigan up to this writing (September 16). Small fruits never suffered so much. If rain does not come soon some fruit plantations will be comparatively worthless.

As an experiment, we piled straw very thickly in the spaces of a few of the strawberry plants at least six inches deep and as close to the plants as possible to see what effect it would have during the dry part of the season. The foliage of the plants near the straw is twice as high and heavy as where not so treated.

Great damage is often done by bad pruning.

Use judgment in regard to how and what you plant.

It is claimed that alternate rows of cherries and plums cause the plums to be more fruitful.

## Rogers' Lima Wax Bean.

Samples of this bean were lately submitted by the introducers, Messrs. Rogers Bros. It is a heavy cropper as is seen by the figure of the individual plant. We took 46 full-sized pods from one such, and left on many others. This bean is named Lima Wax, as it has bright, glossy foliage, and the bloom resembles the dwarf lima. The pods are very broad and flat of a most excellent rich quality. The plant is branching and vigorous, with an immense amount of foliage. When in bloom the plant is completely covered with flowering spikes, and as the pods form in clusters they sink beneath the dense foliage, which shields them from light showers, heavy dews, and hot sun, which is a protection against their spotting or rusting and becoming soiled, as compared with other sorts. They require thin planting (two beans being sufficient for a hill) on very rich soil.

The pods are the broadest of all wax bush beans, color transparent glossy lemon wax, having the yellow waxy appearance very soon after the pods are formed and when picked we find by actual test will retain their bright, attractive appearance for a long time and not become tough. Quality very tender, juicy, and flavor delicate. Seed small, oval, pure white. A delicious wax bean.

## Setting a Blackberry Patch.

I have a patch that has been set some six or seven years of about one-quarter of an acre, and last year it yielded over 800 quarts. This spring it only gave us 170 quarts and most of the bearing vines had the leaves turn yellow and drop off. While the new growth to bear next year was green and nice looking. What is the cause of this dropping of the leaves? I want to transplant a portion of this patch and the question with me is, Will the roots of these plants taken up indiscriminately and cut into proper lengths, do to set the new patch?—G. W. A., Kas.

—The dropping of the leaves on fruiting blackberry canes often occurs, especially when a heavy crop has been raised the previous year. It is due to a lack of vitality which can be restored by scattering broadcast a liberal quantity of rotted barnyard manure in October, and during the winter hauling and scattering over this six to eight inches of old straw or marsh hay. The pieces of roots from these hills taken up this fall will do to start a new plantation, but roots from younger plants are preferred by nurserymen. Bury them, after being cut into proper lengths, in sharp sand below the frost line in a sheltered location, so that the ends of the roots will callus over, and when setting out in the spring, drop five to six pieces in each hill that you may have a good stand. Do not allow a particle of crust to form over the hill when the new shoots begin to push through the soil.—C. C. N.

## Violets for Spring Flowering.

I should like very much to know how to raise Violets and handle them in frames for winter and early spring blooming.—G. A. K.

—It is now time to plant the Violets in frames, and the stronger the clumps are the better. Make the soil moderately rich, and arrange frames so that covering and protecting from frost will be made as complete as possible when necessary. A work which will treat on the cultivation of the Violet is on the press now and will be ready shortly.

## Strawberries for Forcing.

(To A. H. D. and others).—Full information as to forcing strawberries, varieties, etc., will be found in our issue for June 5 of this year. We have no knowledge of Brandywine as a forcing berry.

The apple belt of Illinois is well defined. Governor John R. Tanner says. The apple counties of Illinois are Clay, Marion, Wayne, and Richland. Orchards do fairly in Jefferson, Effingham, Fayette, and Jasper are in the edge of the belt.

FIG. 196.—ROGERS' LIMA WAX BEAN.

We will get all the plowing possible done this fall ready for spring work.

Mexican strawberry seems to be a good grower, with very deep green foliage.

A dusting of air-slacked lime on the leaves is the thing for those slimy-looking insects called slugs.

The tide turns on many products; wheat is a good price now, but corn low in comparison; probably corn will be up to a good price in a year or two. The same is true also to a certain degree of many garden crops.

Our experience with the Golden Hubbard squash is that it is not as satisfactory as the old Hubbard.

Double working of Northern Spy, Golden Russet, and Talman Sweet apples seems to be a very satisfactory method in starting an apple orchard.

If you understand grafting and are intending to set out a plum orchard in two or three years, why not send to some of the nurseries and purchase a few hundred of one-year Marianna plum, and after they have made a satisfactory growth in the nursery row for say one more year, graft them in the row to any varieties you wish, and when three years are up, you will have a medium-sized tree of your own growing to transplant to the orchard?

Are the crates and berry boxes stowed

'It pays to layer strawberry plants especially if there is much dry weather during the latter part of the season.

Irrigation seems now to be commanding more attention from fruit growers than at any time in the past. There must be something beside the wind-mill; it cannot lift a volume of water sufficient to water an area of surface to pay; the new gas engine seems to be the most economical source from which to get the power necessary to throw a large stream, although the first cost of the engine is rather "hard on the purse."

The Jessica grape was of excellent quality this season, but it is too seedy.

A good crop of pears in Michigan; price low and demand poor for second grade, but first-class pears evenly graded are in brisk demand at paying prices.

CHARLES C. NASH.

## Mildew and Spot on Outdoor Roses.

(To Mrs. J. L. E.).—The Roses are affected by black spot which is very prevalent this season. Burn diseased leaves.

## Plants Named.

(To T. B. B.).—1. Panicum sanguinale, Crab grass. 2. Eleusine indica, Yard-grass.

(To J. L. B.).—Campanula isophylla.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 12, 1894.

PUBLISHED BY  
A. T. DELAMARE PTC. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2124 Cortlandt. P. O. Box 1697.  
REGISTERED CABLE ADDRESS  
Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MAGILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 15 cents per square line; in "For Sale" column, 2 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## WANTED.

Copies of AMERICAN GARDENING for March 20, 1897. Address the Publishers.

**Fall Preparation** "GARDENING," it has been remarked, "is a pious occupation, because it is a continuous struggle against adversity." However that may be, gardening is at times a discouraging business; no matter how carefully we may plant and sow, and attend to the growing crops, something is always liable to prove a failure. It is often discouraging to the owner of a garden, after spending a large sum of money, to find his expectations not realized. All this, however, can be largely avoided by proper attention to the fall work.

There is no more appropriate adjunct to a gentleman's country house than a well-planned and well-kept vegetable garden, containing a constant supply of fresh vegetables, and the success of this depends upon the competency and foresight of the gardener, and the nature and mechanical condition of the soil upon which the garden is placed. Any intelligent man can, after the first year, form a fair judgment of the condition of the soil and shape his course accordingly. All vegetables require organic manure, and this must be partially decomposed before it can be utilized by the roots of

plants. To do their best some vegetables require a great deal of manure, while others require but little.

For convenience in the preparation and manuring of the land all vegetables can be divided into two grand divisions—those requiring only fairly rich land, as peas, beans, tomatoes, melons, turnips, brussels sprouts, and those requiring very rich land, or those with good vigorous foliage, as asparagus, beets, cabbage, cauliflower, corn, egg plant, lettuce, radish, rhubarb, spinach, onions. The soil upon which these two divisions are intended to be grown, should be manured according to the requirements of each, and, for convenience in plowing, the items in each group should be grown together as much as may be practicable.

The first division needs more phosphoric acid and potash than nitrogen, as they have the faculty of absorbing sufficient of the latter from the atmosphere, and if too much manure containing nitrogen is added to the soil, large growth of tops will result with a corresponding decrease in the quantity of peas to be picked, or tomatoes to be gathered. Hence, at this season the ground intended for these should receive a meagre dressing of manure, with a liberal dressing of bone dust and potash, the latter can be applied in the form of wood ashes, and it is better to apply these as a top dressing in the spring, as if applied now, the potash will have leached away with the winter snow, but the bone dust (which can be supplied at the rate of from 500 pounds to 1,000 pounds per acre) will gradually dissolve, and by the time the roots are active the following summer, the phosphoric acid which is contained will be available for plant food. The ground then should be deeply plowed and left as rough as it is possible for the plow to leave it, thus its mechanical condition is improved by the action of the winter's frost and the air.

Ground for vegetables of the second division cannot easily be made too rich; it is therefore advisable to put the bulk of the manure on land intended for their planting. As phosphoric acid may be termed the builder of the framework of all plants, and this element being found chiefly in the bones of animals, and not in their manure, so it is advisable in all cases to add bone-dust on ground for this division also; then plow and leave as directed above. On shallow soil or on that of a heavy texture, it is an excellent plan to run a subsoil plow also, thus gradually deepening the soil, which tends better to hold moisture during hot, dry weather.

## C. L. Watrous.

We take pleasure in presenting in this issue a portrait (Fig. 194) of the newly-elected President of the American Pomological Society; he is of New England stock, the first of the name having come from England with Governor Winthrop and settled near Boston about 1630. The subject of these present remarks was born in Cortland Co., N. Y., on January 13, 1837, on a farm. Having graduated from Cortland Academy, Homer, N. Y., Mr. Watrous entered the University of Michigan and passed through the scientific course. At the age of 17 he began teaching, and worked continuously as

teacher and student till the breaking out of the civil war. In September, 1861, he enlisted in the 76th N. Y. V. Infantry, raised a company, and being elected captain, served in that capacity till disabled by three bullets, on August 29, 1862 in the second battle of Bull Run. He was mustered out of service on December 29 of that year "for disability from gunshot wounds received in battle." He was thus not fit for further service during the war.

Turning his attention to the law he graduated from the University of Michigan Law School in 1865 and later in the same year settled in Winchester, Va., remaining there during reconstruction, and until 1868, during the time serving as prosecuting attorney and as U. S. Registering officer.

Giving up the practice of the law in 1868 by reason of broken health consequent upon the wounds received in the war, and other disabilities contracted in the army, and being advised that outdoor life was a necessity, he settled in 1869 at Des Moines, Ia., his present residence, and has ever since followed horticultural pursuits.

In 1872 Mr. Watrous was elected Director in State Horticultural Society, and has from then been an active worker in the body, serving many years as Director, and four years as President. He has also always been active in civil affairs, holding some minor offices, and serving in the State Legislature from 1884 to 1886.

In Horticultural Society work Mr. Watrous has been an active worker and has been identified with the American Nurseryman's Association from the beginning, serving twice as President, and for many years and still as President of its Protective Association. The horticultural literature of Northwest, has been freely contributed to by this gentleman, whose course has always been strongly advocating the origination and testing of American fruits instead of relying upon foreign ones. Having early tested hundreds of Russian fruits and found them in his experience unreliable, he has for many years protested earnestly against their wholesale recommendation and sale, spending more time and labor than any other one man in putting the facts before the people and has been a contributor to AMERICAN GARDENING.

He has been many years a working member of the American Pomological Society, and for the last six years First Vice-President, and was elected President at Columbus September 2d of this year.

**A Grand Opportunity**—Even if you are not very much interested in fruits, make a point of visiting the show at the American Institute, Madison Square Garden, New York City, if at all possible. For it is not often one has the opportunity of seeing and comparing some 75 varieties of Grapes, 80 of Plums, 50 of Pears, and 220 of Apples at so little expense and labor. Certainly the Geneva Experiment Station has staged an exhibit of which New York state may well be proud.

## Death of W. A. Stiles.

It is with feelings of sincere concern that we have to announce the death of William Augustus Stiles, who, since the launching of the Garden and Forest, has so ably seconded Professor Sargent in its direction. Mr. Stiles, who was in his 61st year, died in Jersey City on Wednesday morning after a long and weary illness, and the news of his decease will strike with sorrow wherever he was known.

## BIG BERRIES FOR ALL.

Being the Cultural Methods of Henry Jerolaman, the N. J. Strawberry King, Preceded by an Autobiography.

Continued from page 688.

Many important events in life arise from or depend upon one little word of only two letters, *if*. If Mr. Ogden Brown (my neighbor) had not come down to see me and bragged to me of his little garden patch of strawberries and if I had not immediately gone with him to see his patch while it was in full bearing, it is doubtful if Henry Jerolaman would ever have been known as a strawberry grower, and this story would never have been told.

As already stated, on coming home I made up my mind to have my whole field (as Mr. Brown called it) just like Mr. Brown's patch. At a glance I had seen just what was needed. In the first place it was the first cultivated patch of clean strawberries I had ever seen; and secondly, I saw that the rows must be at least one foot wide with plants, and then top dressed at least two inches deep. Mr. Brown had the whole path, about two feet wide, filled with coarse manure, and the spring rains had so worked it down in the soil that only the straw showed on the surface, thus keeping the fruit clean. The strawberries were lying literally in heaps on either side of the plants. After picking what strawberries I had on my patch, I found they were sandy, for no mulch had been given, not even the top dressing of manure, as Mr. Brown had done. As my berries were not clean, I did not get much more for them in the market than the Southern berries realized, although they were larger than those Southern berries.

During the following summer and autumn I kept my one-half acre of strawberries clean, that is, free from weeds. I did not increase my bed because I did not have the plants, it needing all that I had to fill up the bare spaces in the rows. By fall I had a respectable one-half acre of plants, and before frost set in I filled up all the paths close up to plants on either side with well-rotted stable manure (horse and cow mixed).

As soon as winter set in, December 1st, I covered all the plants with salt hay just deep enough to allow the plants to be seen through it.

In the spring (April 1st) I uncovered the plants and gave them a good cleaning by hoeing all the paths once a week, for oats and such like had come up in profusion. The first week in May I covered all the paths with clean salt hay, some of them were in full bloom, but I covered all manure close up to plants; this kept the fruit perfectly clean.

When the berries were ripe I took a small one-horse load to Newark, selling to Mr. R. Walters, a wholesale commission dealer, who paid me in net cash 30c. per quart and made an agreement to take my whole crop for the season, culls and all, at 30c. per quart net! Mr. Walters sold them to retail dealers, all of whom said they were the first clean strawberries (washed, some called them) they had ever sold. At the time I made this contract with Mr. Walters for 30c. per quart for all my crop, other strawberries were selling from 4 to 6c. per quart. Mr. Walters paid me that season for the berries on the one-half acre (that was all I had), over \$600. I had a good yield; all the one-half acre I thought was just as good as Mr. Brown's patch. I will state here that Mr. R. Walters is still living and if any one doubts the foregoing statement, why let him (or her) write to Mr. Walters who, with his brother C. Walters, to-day keeps a large commission house in Commerce street, Newark, N. J. Mr. R. Walters remembers my selling him that crop in 1872 for 30c. per quart net, for I would not trust him and he paid me as soon as each load was delivered. After paying for picking, manure, and all other expenses, I cleared about \$400 from the one-half acre, and here I desire to atone for a slight error made on page 667. It was in '73 I sold my first berries in New York City not in '72 as there stated.

My father and mother often came to see me, and during strawberry season they came almost every day, as they lived in Newark, having moved back from New York. Father often admitted to me that I had made more from one one-half acre than he did in any year from his whole farm; for at that time he had rented his farm for \$800 per year, and out of that paid the taxes.

For a number of years I controlled all the strawberries grown in my district, but in 1880 too many others started in the business and I lost my grip and I sold plants to all who came for them. Soon our spot was known in almost every state in the Union, and I think that I have sold plants into every state, but will say to all fruit growers that there is no profit in selling plants even at \$2 per 100, unless you set out a bed expressly for growing plants for sale, as in taking plants from a bed you destroy next season's crop. Good plants, like Henry, Mary, or Bubach, or even Sharpless, will pay more than 4c. each, if let to remain for fruit.

I seldom bother with selling plants now, as I can make more money with the strawberries. In 1873 I took the first load to New York, and in '74, '75, and up to 1880 I netted over \$1,000 per acre from strawberries or about \$4,000 per year, as I have never had or set out more than four acres. Even this four acres will take from 20 to 30 first-class pickers to attend to it properly, I may say first-class, for I never employ any other class; all my pickers are neat and clean.

Readers, I think I have told you enough of my history to make you understand what manner of man it is that attempts to instruct you in strawberry growing; there are several stories that could be told and which I would like to tell; each one points a moral, and it is just such stories that have made me what I am, industrious, with a first-class home; they would probably make you laugh but not much richer. I will not bother you with them, but will tell them to the Editor and if in some future issue he chooses to publish them, he can do so. Many will ask, Why did you write anything about yourself at all, for it looks to us as if you were trying to make others believe you were just a little smarter than the general run of people, and that you are blowing your own horn. The first is not my intention, the last is true, for I have blown my own horn ever since I worked for \$5 per month and board in that Brooklyn grocery store, and I can truly say that I have heard the echo from Maine to Florida and California, and I always expect to. There are several reasons why I wrote my sketch; one is that as I grow older I am afraid I am getting more selfish; that is, only giving away that which I do not need; this, I think, is all wrong; we should be always willing to help others if we can. Secondly it was to prove beyond all doubt that the old, old saying is true, every word of it, "Where there is a will there's a way;" the lives of us all prove this. I have known many blind men and women to make money and get rich; I have seen a man born without arms shoot a gun with his toes much better than I can with both my arms; this man I saw shoot in a place of amusement in New York City last winter and tens of thousands have seen this man. If such a man can make money, then there ought to be a chance for every one, and there is. With industry and cleanliness there will always be health unless through accident, and where can you find a more healthful employment than strawberry culture?

In my next I will tell you all how long I keep a bed of strawberries in bearing without resetting the plants; also how they are grown in Florida and California if you wish.

Subscribers and agents desirous of securing a large stock of the Henry Straw-

berry for the coming spring should not relax in their efforts to obtain new subscriptions to AMERICAN GARDENING. The names can be sent in right along, and as each one is received a credit will be duly entered up to the party forwarding them.

### SPECIMEN LETTER.

(From a subscriber in New York State to Mr. H. Jerolaman.)

Dear Sir—I received the plants in splendid shape. In fact, they are, without exception, the finest and strongest plants I ever had, and if the berries are anything like the plants in regard to perfection, you cannot speak any too much for them. I have transplanted them to their new home, and have tried to give them a fitting one; a piece of ground in which I had planted peas, and fall and spring spaded in manure and kept it clean and under good cultivation, so the soil is fit for my greenhouse, so mellow and fine, so with good care I expect good results. I have read your articles in AMERICAN GARDENING; they are excellent and contain many good points. Although I have taken the papers that have been issued previous to AMERICAN GARDENING for the past 20 years, I have learned more common sense in the suggestions you have given than in most all of the rest put together, particularly in regard to setting out plants. The trouble with many like myself would be in either planting them too shallow or too deep, or in covering the crowns, and thereby getting a lot of spindly plants. Keep the good work going, and let me thank you for your kindness in sending me such fine plants. I have bought plants many times, but never received such fine ones. —F. SIBSON, N. Y.

### Setting Out Strawberry Plants.

Readers who are to receive premium plants of the Henry are asked to observe the caution now given. Of course each one wants all the plants to grow, therefore see to it if the ground be dry to wet each plant with at least one cupful of water every other day until rain comes. If the weather be hot, shade them with a board, putting bricks or stones under each end to keep it off the plants. There is no reason why any one should loose a single plant.

### The Henry Strawberry is Controlled Exclusively by American Gardening.

Mr. Jerolaman wishes it to be distinctly understood that he is not a nurseryman, but is a fruit grower; it is not his business to sell plants. Hitherto he has disposed of a few plants in order to have the variety generally tested. For the future, however, the Henry Strawberry plants will be distributed only as premiums through AMERICAN GARDENING.

Plants will be delivered from now onward through the month of October, or until the ground freezes, which in the place where the plants are growing is not until December. Mr. Jerolaman always sets out plants for himself until the middle of November, and in some seasons even up to the end of that month.

In the case of Hans Jensen vs. the Griswold Seed Company, Judge Holmes, of Nebraska, holds that the property of the plaintiff is his homestead and that it may not be seized to satisfy any claim the defendant may have. A sale made was vacated but judgment was given to Oscar Barailles. The value of the property is \$200.

The peach crop in the Southern Ulster, N. Y., fruit belt is the largest since the big yield in 1880 and the grape crop is the most abundant the growers have known in years.

The peach growers of Maryland have called a convention. They probably want to find out why people don't believe their annual announcement that the peach crop is a failure, says the Syracuse Post.

**W. & D's.**  
**CELEBRATED SURE CROP.**  
**MUSHROOM SPAWN.**  
**8 LBS. FOR \$1.00.**  
 Lillum Harriell, Roman Hyacinths, Freesias,

## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent  
 appointments and movements are requested to  
 forward particulars of the same for publica-  
 tion in this column. No charge is made.

David Fraser lately of Mahwah, N. J.,  
 has accepted the position of head gar-  
 dener to W. H. Frick, Esq., of the Carne-  
 gie Steel Co., at Pittsburgh, Pa.

F. Sander & Co., St. Albans, England,  
 will hold their annual fall Orchid sale at  
 Cleary & Co.'s auction rooms, 60 Vesey  
 street, New York, Friday, October 15.

T. Patch, recently plant foreman for the  
 Pitcher & Manda establishment at Short  
 Hills, N. J., has been appointed to take  
 charge of the beautiful estate of J. T.  
 Williams, Esq. at Stamford, Conn. Mr.  
 Patch begins his new duties to-day, Octo-  
 ber 9.

As a general rule the daily newspapers  
 are charmingly unreliable on horticultu-  
 ral topics. It is interesting in this connec-  
 tion to see the Inter-Ocean (Chicago, Ill.)  
 has a sound article on Cannas with good  
 illustrations of the best varieties. The  
 only gross blunder was "stone head" for  
 stove heat!

Herman F. Krause, a well-known land-  
 scape gardener, died at his home, Fair-  
 mont avenue, Jersey City, from debility,  
 incident to old age, on September 27.  
 Mr. Krause was also a topographical  
 engineer. In 1856 he submitted plans to  
 the commissioners for Central Park, and,  
 though they were not adopted, they were  
 adjudged second best. As a result he  
 was employed as a topographical  
 draughtsman at the Park, which posi-  
 tion he held for ten years, and was after-  
 wards made chief of the topographical  
 draughtsmen of Central Park. Deceased  
 was born in Saxony in 1817. He came  
 to this country in 1854, and resided in  
 New York up to 1879, when he removed  
 to Jersey City. Two sons survive him.

### Hartford, Conn.

The Horticultural Society held its ex-  
 hibition here September 23 and 24, and  
 was a very successful affair. Awards  
 were as follows:

Greenhouse and stove plants—Best dis-  
 play, owned by exhibitor three months,  
 not less than 20 named varieties, W. B.  
 May and T. J. McDonald; Palms, best  
 collection, W. B. May; Ferns, W. B. May;  
 variegated Caladiums, R. Patchet;  
 Dahlias, J. Albiston and Mrs. A. Trask;  
 Asters, J. Albiston; Crotons and Dracæ-  
 nas, W. B. May; tuberous-rooted Begon-  
 ias, Mrs. A. Trask; cut flowers, S. J. Al-  
 biston; best collection of wild flowers,  
 William Henderson; best collection of  
 vegetables, W. B. May and G. Minge;  
 beets, R. Patchet, H. Butler and W. Hen-  
 derson; carrots, W. Henderson; turnips,  
 E. Elmer; cabbages, H. Butler and G.  
 Minge; celery, G. Minge. All other prizes  
 were captured by R. Patchet, G. Minge,  
 A. C. Sternberg, H. Butler, E. Elmer, C.  
 O. Purinton, and A. Trask. A Chrysan-  
 themum exhibition will be given in Put-  
 nam Phalanx Hall, November 9, 10,  
 and 11.

### The Gardens of the Vatican.

The gardens of the Vatican are famous  
 the whole world over for their beauty  
 and their size, and therein the Pope enjoys  
 what fresh air and exercise he has been  
 able to obtain since he has been the pris-  
 oner of the Vatican, and, contrary to  
 general anticipation, there is very little  
 difficulty to be experienced in obtaining  
 admission, though a special license has to  
 be obtained, which can be obtained from  
 the chief guide, the grounds being reached  
 from a grille on the basement of the  
 sculpture galleries. From this grille  
 stretches a handsome terrace, bordered  
 on the right by a fine hedge of Arbutus;  
 on the left by a sunken garden set with  
 Aloes and Yuccas and Orange trees on  
 pedestals almost as thick as they can  
 stand, which presents a very curious  
 effect. The terrace terminates in a dense  
 shrubbery, untrimmed since it was  
 planted, and overhung by tall trees.  
 Here are kept some macaws. A little dis-

tance beyond, in a copse, was a bricked  
 court, some 20 feet or so below the level,  
 wherein are kept half a dozen moutons.  
 Leaving the dismal shrubbery at the foot  
 of a broad walk rising gently between a  
 row of young plane trees and a very high  
 bank. Upon the other hand were plane  
 trees, with clumps of Italian reeds here  
 and there. Passing along a variety of  
 bits of garden, the Pope's Walk was  
 reached, a promenade of some 200 feet in  
 length. In summer it is shaded by a lofty  
 bank for the most part of the day, and  
 so remains comparatively cool in the eve-  
 ning. Further on from the Pope's Walk  
 is the vineyard, which covers about an  
 acre. There is a deer park, ostriches and  
 pelicans are kept in an enclosure, and  
 there is a fair quantity of poultry.—  
 W. N. B., in Gardeners' Magazine.

### The Canna is Threatened.

A dangerous Canna disease, a fungus  
 that quickly destroyed various species,  
 was recorded as long ago as 1884 when  
 it was noticed at San Paulo, in Brazil.  
 Quite recently an account of the destruc-  
 tion of Cannas, by what proves to be the  
 same fungus, *Uredo cannae* (Winter), has  
 been received at Kew from Mr. J. H.  
 Hart, superintendent of the Botanic Gar-  
 dens, Trinidad. Diseased leaves are at  
 first thickly studded with minute, yellow-  
 ish spots; this appearance is quickly fol-  
 lowed by blackening and death. The  
 disease does not appear to have reached  
 Europe or the U.S. as yet, and great care  
 should be exercised in receiving living  
 plants, as the fungus, which is a close  
 ally of the Hollyhock rust (*Puccinia mal-  
 vacearum*), if once introduced, would, in  
 all probability, render impossible, for a  
 time at least, the cultivation of Cannas.

### White Plains, N. Y.

The Westchester County Horticultural  
 Society held a very successful exhibition  
 of plants and flowers in a tent provided  
 for their purpose at the County Fair,  
 White Plains, September 27 to October 2.  
 F. R. Pierson Co., Tarrytown, exhib-  
 ited a fine group of Palms, Mr. George  
 Barton, gardener for J. D. Laying, Mt.  
 Kisco, had a collection of Dahlias and  
 flowering Begonias. Mr. A. L. Marshall,  
 gardener for J. B. Dutcher of Pawling,  
 exhibited a fine collection of seedling Can-  
 nas, including the new America, also  
 some fine specimens of Coleus. Mr. J. H.  
 Crane of Mt. Kisco had some fine Palms.  
 Mr. John Gerry, gardener for W. B. Dic-  
 kerman, Mamaroneck, a pair of Pandanus  
 Veitchii; Samuel Kerr, gardener for Brad-  
 ford Rhodes of Mamaroneck, a collection  
 of Palms; Mr. James Wood, Mt. Kisco, a  
 display of French Marigolds; Mr. James  
 Hopkins of Armonk, some Hydrangea  
 paniculata; Mr. F. M. Carpenter, Dah-  
 lias; Mr. H. A. Spavins, Mt. Kisco, a col-  
 lection of 20 varieties Rex Begonias and  
 seedling Canna Mrs. J. B. Dutcher.

### New York.

The Horticultural Exhibition at Mad-  
 ison Square Garden, given by the Amer-  
 ican Institute, continues, as the time goes  
 on, to be an unqualified success. The  
 Dahlias of the first week have given way  
 this week to a more varied line of cut  
 flowers. Exotic plants of rare value are  
 also noticeable. Fruits are abundant and  
 of excellent quality, and the same can be  
 said of vegetables.

### Plants.

One of the chief attractions of the  
 show is a fine plant of *Dracæna Sandera-*  
*ana* with 22 growths exhibited by Wil-  
 liam Duckham, gardener to D. Willis  
 James, Esq., Madison, N. J. The Insti-  
 tute's medal of excellence was granted to  
 this superb exhibit. Mr. Duckham also  
 gained first honors for six stove and  
 greenhouse plants, and second for three  
 Rex Begonias, also first for specimen  
 Palm, entering what is probably one of  
 the rarest Palms in the country, viz., *Co-*  
*cos Bonnetii*.

Mr. G. Hale, Bellport, L. I., was a suc-  
 cessful exhibitor and staged a very at-  
 tractive group of foliage plants includ-  
 ing some well-colored pieces of *Alocasia*  
*macrorrhiza*. Mr. Hale secured first also  
 for three specimen *Dracænas*. Mr. A. Wel-

ing, Brooklyn, secured first honors for Rex Begonias with three excellent plants, among which Fuerst Bismarck was one of his best.

Special exhibits of plants came from James Dowlen, gardener to L. H. Terrell, Seabright, N. J.; N. Butterbach, gardener to C. N. Bliss, Oceanic, N. J.; and H. Kettell, gardener to S. Loeb, Seabright, N. J. Mr. Dowlen had two grand Ferns; his piece of *Nephrolepis exaltata* Bostoniensis was over seven feet in diameter. The special feature of Mr. Butterbach's display was in the fact that they were all grown in Jadoo fibre. This same exhibitor also secured first prize for six table plants.

Among trade exhibitors were F. R. Pierson Co., Tarrytown, N. Y., and Siebrecht & Son, New Rochelle, N. Y. The first-named had a charming group of plants arranged in front of the stage, and a large number of Bay trees distributed about the hall. This firm also secured first honors for Araucarias, Ferns, and Pandanus. To the second named firm went first honors for six Ferns, six Dracaenas, and a special for a group of ornamental foliage plants.

#### Cut Flowers.

The class for amateurs brought out three exhibits, all of which were of the highest order of excellence. Mr. Hale secured first and Mr. Dowlen second, Miss Ida French receiving a special. Mr. Dowlen covered himself with glory in a special display of Coxcombs and other Celosias, in all over 30 distinct varieties. For this he was awarded a diploma. A. Weising exhibited seedling Cannas.

In the professional classes John Lewis Childs, Floral Park, was first with even a better lot of miscellaneous cut flowers than he staged last week, and certainly his special exhibit of Gladioli was finer. W. K. Peacock also outclassed his previous efforts with two grand tables of Dahlias.

#### Fruits.

The feature here was the display of hothouse grapes. Mr. W. Turner, gardener to William Rockefeller, Tarrytown, secured first for the best collection, with five kinds, two bunches of each. His best bunches were Madresfield Court, and Muscat of Alexandria. It is questionable if ever better berries of the first-named have ever been seen on our show boards; Mrs. Pince, Barbarossa, Black and Hamburg made up the balance of his collection.

For the best two bunches of white grapes, W. Scott, gardener to Mrs. F. C. Eastman, Tarrytown, was first with Buckland Sweetwater, superbly colored, also large in berry and bunch. Mr. Nichols, gardener to Mrs. J. B. Trevor, Yonkers, was a close second with two fine bunches of Muscat of Alexandria.

For the best two bunches of black grapes the judges awarded equal first to W. Scott and D. McIntosh, gardener to Howard Gibb, Islip, L. I., the last-named staging two high-colored, well-finished bunches of Alicante, while Mr. Scott had two grand bunches of Black Hamburg, a little over-ripe.

Ellwanger & Barry, Rochester, N. Y., and C. C. Corby, Montclair, N. J., were the largest exhibitors of American grapes, and the New York State Farm at Geneva makes a most remarkable display on which further comment will be made. Apples and Peaches are also well represented, but at time of going to press, the awards were not made.

#### Vegetables.

These are not so numerous as last season, but what is lacking in quantity is more than made up in quality. A special display of 64 kinds shown by J. Dowlen makes what is certainly as neat and clean a lot of vegetables as was ever staged by a gardener, and contained a marvelous assortment. With this, as with other vegetables, the awards at time of writing were not known.

The full list of awards made at the first week's display, of which the report appeared in our last issue is as follows:

Dahlias (professional class)—Not less than 100 varieties, not less than six blooms of each; first, W. P. Peacock, Atco, N. J.; second, H. F. Burt, Taunton, Mass. Fifty varieties: First, H. F. Burt;

second, W. P. Peacock. Twenty-five varieties: First, W. P. Peacock; second, H. F. Burt; extra to G. H. Hemling, 620 Hamburg avenue, Brooklyn, N. Y. Ten varieties: First, W. P. Peacock; second, H. F. Burt; certificate to G. H. Hemling; special prize to Lothrop & Higgins, E. Bridgewater, Mass. Display of singles, not less than 100 flowers, W. P. Peacock. Display of Cactus varieties, W. P. Peacock. Display of Pompon Dahlias: First, W. P. Peacock; second, H. F. Burt; certificate, Lothrop & Higgins.

Dahlias (amateur class)—Not less than 100 varieties, Rev. C. W. Bolton, Pelham, N. Y. Fifty varieties: First, D. Wilson, Orange, N. J.; second, Rev. C. W. Bolton. Twenty-five varieties: Rev. C. W. Bolton. Ten varieties: First, W. H. Smith, Maplewood, N. J.; second, Rev. C. W. Bolton. Cactus Dahlias, Rev. C. W. Bolton. Pompon Dahlias, Rev. C. W. Bolton.

Gladioli—Collection of not less than 50 varieties—For 25 varieties and for 10 varieties, John Lewis Childs in each case.

Miscellaneous cut flowers—Collection of hardy flowers not to include Roses and Carnations (amateurs): First, J. W. Duncan, gardener to W. H. S. Wood, Greenwich, Conn.; second, A. Herrington, gardener to W. H. McK. Twombly, Madison, N. J.; (professionals), J. L. Childs.

Wild flowers—Collection correctly labeled with their botanical and English names: First, A. Herrington (64 species); second, Miss Ida C. French, Springfield, N. J.

Special awards—Collection of flowering and berried shrubs, J. W. Duncan. Display of Dahlias in pots, medal of excellence and diploma for display of blooms, C. W. Ward, Queens, L. I., N. Y.

Carl Blomberg (gardener to Oakes Ames, Esq.), North Easton, Mass., for a display of 103 species of wild flowers (diploma). Display of Water Lilies (medal of merit). *Nymphaea cœrulea striata* (first-class certificate). *Nymphaea cœrulea Eastoniensis* (first-class certificate).

William Turner (gardener to William Rockefeller) Tarrytown, N. Y., Pitmas-ton Duchess Pear grown in pots under glass (special prize).

G. H. Hemling, 620 Hamburg avenue, Brooklyn, N. Y., vase of Dahlias with Ferns arranged for effect (special).

Medal of merit was awarded to F. R. Pierson Co., for display of Cannas; also a first-class certificate for new scarlet Canna, Tarrytown, for intense color, free flowering qualities and general usefulness; also first-class certificate for specimen plants of *Nephrolepis Bostoniensis*; diploma for group of ornamental foliage and decorative plants.

Diploma for collection of Bay Trees—Siebrecht & Son, 409 Fifth avenue, City.

Stand of letter work and patent pot-holder, W. C. Krick, 1287 Broadway, Brooklyn.

H. Spavins, Mt. Kisco, N. Y., exhibited new seedling Dahlia, Mrs. J. B. Dutcher.

Hereafter the plants in the public squares of Philadelphia will be distributed among the schools when the fall season begins. It was formerly the custom to give the plants to anyone making application for them, special days being set aside for the distribution.

There is more Catarrh in this section of the country than all other diseases put together, and until the last few years was supposed to be incurable. For a great many years doctors pronounced it a local disease, and prescribed local remedies, and by constantly failing to cure with local treatment, pronounced it incurable. Science has proven catarrh to be a constitutional disease, and, therefore, requires constitutional treatment. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, Ohio, is the only constitutional cure on the market. It is taken internally in doses from 10 drops to a teaspoonful. It acts directly on the blood and mucous surfaces of the system. They offer one hundred dollars for any case it fails to cure. Send for circulars and testimonials. Address, F. J. CHENEY & CO., Toledo, O.

Sold by Druggists, 75c.

**INCUBATORS.** Self-regulating. Catalogue free. G. S. SINGMASTER, Cardington, O.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{2}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Description

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW name sent in by an agent.**

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

Address all  
correspondence

**AMERICAN GARDENING, P. O. Box 1697, New York.**

REMIT BY P. O. or EXPRESS MONEY ORDER.—IT IS SAFEST.

## WHOLESALE MARKETS.

### New York.

The recent Jewish holiday has had its effect upon the fruit and vegetable market which has been rather quiet in consequence, but at the same time prices have held firm.

Mushrooms are just beginning to come in and the price is unsettled, very few sales being made at \$1.

Hothouse tomatoes had not appeared on the New York market up to time of going to press, but it is expected that they will have arrived before next report reaches our readers. Near-by hothouse grapes are rather dull and of poor quality; foreign stock is looked for during the month, and this will be of the usual good quality.

The potato market has had a drop, prices had advanced too rapidly and were at too high a figure to last, consequently the quotation of \$3.25 of last week has given place to \$2 or \$2.25 this week.

Native grapes are very low; they can hardly pay the grower at present figures. On Monday eight carloads were sold off by auction, large baskets realizing 10¢ 11¼¢, small ones 6¢ 6¼¢. This auction business has let loose a large lot of stock which is sold on the streets, and has cut into store trade.

Onions are in large supply, and the market is somewhat easier.

The general tone of the apple market seems to be somewhat easier; dealers have become pretty well stocked up with high-priced fruit which has not moved at all freely from second hands, and they are now disposed to hold off; on positively fancy apples previous quotations are maintained, but on average offerings there is some weakness and slight shading of prices. There is no material change in the market for pears; the Bartlett's offering are still of a wide range of quality, condition, and value, some lots being in bad order; other kinds are selling at previous quotations. Quinces dull but not plenty, \$1.50@2. Plums are quite plenty and moving slowly at a wide range of prices.

Apples—Soft red, table sorts, fancy, d.-h. barrel, \$3.50@4; soft red sorts, fair to prime, per barrel, \$2@3; Fall Pippin, hand-picked, per d.-h. barrel, \$2@2.50; Twenty-Ounce, hand-picked, per d.-h. barrel, \$2.25@2.75; King, hand-picked, per d.-h. barrel, \$2.25@3; Ben Davis, per barrel, \$2.25@3; Greening, hand-picked, per d.-h. barrel, \$1.50@2.25; Baldwin, hand-picked, per d.-h. barrel, \$1.50@2.25; mixed varieties, fair to good, per barrel, \$1.75@2; mixed varieties, poor to fair, per barrel, \$1@1.50; Jersey, winter, open heads, \$1@1.25; Crab apples, per barrel, \$2@4.

Peaches—Maryland, fancy Salway, per carrier, \$1@1.50; Smocks, per carrier, \$1@1.25; Clings, per carrier, 75¢@1; Jersey, extra, selected, yellow, per basket, 65¢@1; extra selected, red and white, basket 60¢@75¢; choice, per basket, 40¢@50¢; Western New York, per carrier, 75¢@1.25; up-river, carrier, 2 pony baskets, 60¢@1.

Pears—Bartlett, large, clean, per barrel, \$2.50@3.50; Seckle, per barrel, \$2@4; Beurre Bosc, per barrel, \$1.50@2.50; Sheldon, per barrel, \$1.50@2; Beurre d'Anjou, per barrel, \$1.25@1.75; Beurre Clairgeau, per barrel, \$1.25@1.75.

Grapes—Delaware, up-river, per 24-pound case, 50¢@75¢; western New York per small basket, 9¢@11¢; Niagara, up-river, per 24-pound case, 50¢@60¢; western New York, per small basket, 9¢@10¢; per 20-pound basket, 30¢; Concord, up-river, per case, 40¢@45¢; western New York, per small basket, 7½¢@8¼¢.

Wine grapes—White kinds, in trays, per pound, 1¼¢; Delaware, in trays, per pound, 2¢@2¼¢; black kinds, in trays, per pound, 1¢@1¼¢.

Plums—French prune, per 8@10-pound basket, 25¢@35¢; German prune, 8@10-pound basket, 20¢@30¢; Gage and Reine Claude, 8@10-pound basket, 15¢@20¢; Damson, per 8@10-pound basket, 12½¢@25¢.

Nuts—Receipts of chestnuts are more liberal and prices show a decline. Hickory nuts are not plenty but there is very little demand for any important quantity except at very moderate prices.

Chestnuts—Northern, per bushel, 60 pounds, \$8; southern, per bushel, 60 pounds, \$7@8; hickory, per bushel, 50 pounds, \$1.50@1.75.

Only a few cauliflowers, and these largely of inferior quality. Celery steady for fancy large but trade quiet and medium and small move slowly. Cabbages firm for choice stock. Tomatoes continue in light supply and steady. Russia turnips firm for prime quality.

Cauliflowers—Fancy, per barrel, \$1.75@2.25; poor to fair, per barrel, \$1@1.50.

Celery—Choice to fancy, large, per dozen, 25¢@40¢; fair to prime, per dozen, 15¢@20¢; small and poor, per dozen, 8¢@12¢.

Corn—Per 100, 75¢@1.25.

Cabbages—Jersey and Long Island, per 100, \$4@6.

Cucumbers—Shelter Island, per barrel, \$1.50@3; selected, per 100, 75¢@1.

Lima beans—Jersey, Potato, per bag, \$1@1.25.

Parsnips—Per barrel, \$1@1.25.

Peppers—Jersey, red, per barrel, \$1@1.25; Jersey, green, per barrel, 60¢@90¢.

Squash—Hubbard, per barrel, 75¢@1.25; Marrow, per barrel, 60¢@75¢.

Turnips—Russia, Canada, per barrel, 75¢@90¢.

### Boston.

Peaches are nearly over, some near-by stock bringing \$1@1.75 per basket; Hudson River 75¢@1.50, according to size of basket and quality of fruit.

The recent frosts advanced the price of tomatoes. Fancy outdoor stock, when it can be found, easily brings \$2 a bushel, with common grade \$1@1.50, while hothouse sells \$6@7 a bushel. We forget from one year to another oftentimes, but it seems as if these present offerings of hothouse tomatoes are about the best we ever saw.

An easier feeling exists on apples, owing partly to warmer weather, partly to heavier receipts, and partly to the different qualities the purchaser finds in a car of apples. One barrel seems to have been put up by a first-class packer, and perhaps the next one opened will contain more or less No. 2s. Western Spies or Ben Davis \$2.50@2.75; Jonathans \$3.25@3.50; Greenings take a range of \$2.25@2.75.

Cantaloupes and watermelons show up each morning and meet but a limited demand at any price.

Hothouse grapes take a range in price 25¢@50¢ a pound; demand limited. Native stock pony baskets, Delawares, 12¢; Concord, 10¢; Wordens, 9¢; Niagaras, 15¢; a fair quantity of the 10-pound basket Concord showing up this week, bringing 15¢.

The colder weather makes a little healthier call for celery, but price is unchanged, 75¢@1.25 a dozen. Artichokes not quite as firm, \$1@1.25 a bushel.

No change in beans; agricultural \$1 a bushel; Sievas \$1.50@1.75; Limas \$1.50.

Cauliflower is excellent, clean as a whistle, apparently people not using very much. Selling 8¢@15¢, according to size of head. Onions very firm at \$2.25 a barrel.

Hothouse cucumbers are just perfect and are having good liberal sale, \$4@6 per 100.

Cranberries much higher; take a range of \$5.50@6.50 per barrel; \$2@2.25 per bushel crate.

Peppers move slowly at about 50¢ a bushel, while egg plants take a range of 50¢@75¢ for the same quantity.

Squash pies getting into line and with the lighter yield of near-by squash, creating a very healthy demand, \$1@1.25 for Marrow per barrel; Hubbard \$1.50; Turbans or Bay State, \$1.50.

Pears are in good condition and wanted: Seckles \$1.50@2 a bushel; Sheldons \$1.25@2; Congress \$1.75@2.25; Bartlett's \$1.75@2.25.

Mint hangs around 40¢ a dozen bunches. Very light call for lettuce; quite large supply offered; the only im-

## FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advertisement, and each initial, or a number, counts as one word. No cuts or display type allowed.

**RASPBERRY** and Strawberry plants. Chas. C. Nash, Three Rivers, Michigan.

**GLASS** a wholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 464 W. Broadway, New York.

**CUTHBERT** raspberry plants. \$3.75 per 1000. Taylor blackberry plants, \$1.00 per 100. Order now. John Dinsmore, Jeff. Co., Fernwood, Ohio.

**DO YOU WANT** the best flower pots? If so, send address to The Whildin Pottery Co., 713 Wharton St., Philadelphia. Three shipping points, can save you freight.

**L. C. BOBBINK**, Rutherford, N. J.—Dutch Bulbs, Clematis, Magnolias, Rhododendrons, Azaleas, etc. Branch of the Horticultural Company, Boekoop, Holland.

**DIRECT** from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

**CALIFORNIA** Privet make the finest ornamental hedge, and are perfectly hardy. Fine large plants grown at seashore, two years old, \$3 per hundred. Cash with order. References, First National Bank, Asbury Park, N. J., State Banking Co., Newark, N. J., Atlantic Coast Nursery, James H. Cornell, Proprietor. Office, 606 4th Ave., Asbury Park, N. J.

**CELERY**, blanched with paper tubes; five thousand in use for the fourth time this season, celery and onions grown together; fifty cord of bunch onions, three hundred bushels of dry onions, one hundred cord of celery to the acre, one dollar's worth at a stand without moving. Combination is the word, not rotation; no second hand, no copy, no old fogey; full information given; price one dollar. Richard Branson, Box 451, Syracuse, N. Y.

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

### Business Cards.

**C. D. Zimmermann**, Buffalo, N. Y. Horticulturist. Landscape Gardener. Plans and estimates furnished.

ALL KINDS OF PRODUCE TAKEN ON COMMISSION.

HOT HOUSE FRUITS A SPECIALTY.

Mention American Gardening when you write.

mediate demand being for salads or to adorn meat orders; sells 12c. a dozen heads. Parsley about 50c. a bushel. Cabbage holding their own 4@5c. a head. Carrots \$1@1.25 a bushel. Beets or turnips 40@60c. a bushel.

Very little change in potato market from last week; receipts are ample; prices range from 70@80c., the stock from Maine being about the poorest ever offered in this city; the quality from western New York or from Michigan or from Minnesota seems to be all right, and so far has given satisfaction. It is quite evident that New England must look west of the Hudson River for eating potatoes.

Sweet potatoes are in moderate supply, good demand, \$2@2.25 a barrel.

The first "sweet Sops" ever seen on this market arrived last week from Jamaica. It is believed they are an article that will be wanted in this market. Encouragement can also be offered for Alligator pears from the same country which have been coming here for about a month.

There was picked in the old town of Acton last week about 80 quarts of luscious strawberries. Your readers will remember this town was heard from on "April 19, 1775," and it was within a few rods of the spot where the patriots shed their blood, that these berries were grown. Another man in luck, was a farmer on the Hudson River who sent us 32 quarts of nice red strawberries; wholesale price for each of these lots about 50c. per quart; retailer varied his figures according to his customers.

#### Philadelphia.

The market has been very good this past week, being well cleaned up every day. Supplies of apples have been light and there is a good demand for choice fruit, prices of which are strong. Peaches are in fair supply and quiet. Pears have been fairly liberal in supply, but business in fresh receipts has been somewhat restricted by liberal offerings of cold-storage Bartlett's at low figures. Grapes have been in good supply, the market is quiet, and prices easier.

Apples—Jonathan, per barrel, choice and fancy, \$3@3.25; Maidens' Blush, per barrel, choice, \$2.50@3; Gravenstein, Black Detroit, and Twenty-Ounce, per barrel, choice, \$2.75@3; mixed varieties, choice, \$2@2.50; fair to good, \$1.25@1.75.

Peaches—Mountain fruit, per 6-basket carrier, choice, \$1.25@1.50; per five-eighths bushel basket, choice, 75c.@\$1; per five-eighths basket, fair, 40@60c.; per 20-pound basket, choice, 65@75c. small clingstones, 20-pound basket, 25@30c.

Pears—Bartlett, per barrel, \$2.50@3; per bushel keg, \$1@1.25; Seckel, per barrel, \$3@3.25; per one-half barrel, \$1.50@1.75; Louise Bonneper barrel, \$1.50@2; per one-half barrel, 75c.@\$1.

Grapes—Hudson River, per 20-pound case, 40@50c.; N. Y. Concord, per 5-pound basket, 6@7c.; per 10-pound basket, 12@18c.; N. Y. Delaware, per 5-pound basket, 9@10c.; Niagara, per 5-pound basket, 9@11c.

Cranberries—Cape Cod, choice, per barrel, \$3.50@6; medium as to size and color, \$4@4.50; per crate, \$1.50@1.75.

Quinces—No. 1, per barrel, \$2.50@3; No. 2, per barrel, \$2@2.25.

Beets—Local, per 100, \$1@1.75. Celery, choice, per dozen, 80@40c.; fair, 15@20c. Corn, Jersey, per 100, 75@90c. Cabbages, per 100, \$2.50@3.50.

Lima beans.—Per 100 pounds, \$2@2.50. Green peas, Marrows, per bushel, \$1.25@1.35; fair to good, 75c.@\$1.

Onions—Jersey white, Per barrel, \$1.75@2; per bushel, 60@70c.; yellow, per barrel, \$1.25@1.50.

Potatoes—Receipts have been light and market has been stronger. Choice, per barrel, 85@90c.; fair to good, 70@75c.; Jersey, per five-eighths basket, 45@50c. Jersey sweets, per five-eighths basket, 30@35c.

#### PEACH TREES, \$3 P-R 100.

All kinds of Trees and Plants CHEAP. Cat. FREE. RELIANCE NURSERY CO., Box 1410, Geneva, N. Y. Mention American Gardening when you write.

## Using Stable Manure.

Can you suggest any preparation of stable manure, so that it may be used in large quantities on a large market garden, without danger of breeding ground maggots, wire and cut worms? I have run a large market garden on very light, sandy soil for five years. For the first three years I used stable manure made the winter previous, and have only been able to get about one-third of a crop of onions, beets, carrots and cabbage. For the past two years I have used phosphate, and although I have not been much troubled with the worms, which seemed to be bred or attracted by the manure, my soil is so light and sandy that phosphate does not seem to take the place of manure. By mixing my manure with other things or by some preparation of it, can the germs which seem to exist be killed, and should I be able to obtain a better crop?—SUBSCRIBER.

—If the manure were well-rotted before being put on the soil, the trouble would probably be lessened. Dissolved rock phosphate might be scattered through the manure pile at the rate of 50 pounds to the ton during the rotting process; it would prevent loss of ammonia and perhaps make it unpleasant for grubs. If the manure were hauled onto the garden during the winter and scattered evenly over the surface, there would be no material loss of manurial value and the alternate freezing and thawing would tend to destroy the grubs and worms.

Organic matter in a light, sandy soil is a most important ingredient and in market gardening, about the only way to secure this organic matter is by applying manure. However in the methods sometimes advised for the proper preparation of this manure, as much time and labor must be spent as the increase in the crop is worth. Plowing the garden in the fall and scattering the manure as it is produced is all that I can suggest, and it may prove entirely effective.—JOHN FIELDS.

## SOME BARGAINS IN CLUBS

FOR

Men, Women and the Young.

**Ohio Farmer**, a giant among the agricultural weeklies, and American Gardening. The two, one year, For \$1.60.

**Farm, Field and Fireside**, a 32 to 40 page weekly Farm and Family Journal, the best of its class, and American Gardening. The two, one year, For \$1.50.

**Country Gentleman**. This weekly amply covers the field its title indicates. Every country gentleman should subscribe to it. And American Gardening. The two, one year, For \$2.75.

**Farm Journal**, the "little giant" of monthly journalism in matters agricultural, and American Gardening. The two, one year, For \$1.25.

**Farm Poultry** (semi-monthly), and American Gardening. The two, one year, For \$1.50.

**Poultry Monthly** and American Gardening. The two, one year, For \$1.25.

Above is your choice of two most excellent poultry magazines. And nearly every one of our readers keeps poultry. Why not subscribe to both? The two poultry papers and American Gardening, one year, For \$2.25.

**Meehan's Monthly**, a horticultural stand-by, and American Gardening. The two, one year, For \$2.85.

**Harper's Magazine**, as good as ever; none better among the literary monthlies, and American Gardening. The two, one year, For \$4.25.

**Ladies' Home Journal**, an unrivaled monthly for women, the standard in its class, and American Gardening. The two, one year, For \$1.90.

**Youth's Companion**, of Boston. At the head of all journals for both boys and girls, and read by the elders, too. And American Gardening. The two, one year, For \$2.35.

NOTE.—Above rate for new subscriptions only. Club, in renewal, \$2.75.

## OUR CLUB LIST

LET US FILL YOUR ORDERS FOR 1898.

Below we print a comprehensive list of the leading publications of the day. When more than one is wanted in club we will be pleased to send you an estimate.

Our list has been carefully selected, and the price at which we offer magazines, etc., in club with AMERICAN GARDENING has been made as low as is possible, in order to induce our friends to place their orders through us and to enable them to obtain their literature at a great saving over orders placed singly.

Kindly remember we are not confined to the below list, but can furnish any newspaper or magazine published in the world, singly, or in club with AMERICAN GARDENING.

The first column of figures [A] indicates regular yearly subscription price; the second column [B] our price, including AMERICAN GARDENING for one year.

## ALL ABOUT THE HOME PLOT

## POPULAR NOTES FOR THE SUCCESSFUL AMATEUR.

## The Large Poultry Raiser.

If the large raiser of poultry has one point of value to the community above all others, it is an object lesson. The dabbler and the small utility man are alike prone to think that there is little for them in the experience of the man that is "in deep." This is just where they make a mistake. Their own practices, if in error, may make so little difference in the purse that they will go on for years at a loss, simply because the matter seems scarcely worth looking into. But in poultry rearing and handling, if anywhere, it is the little things that tell. To the big grower, the little things tell so large a combined story that he must know every loss and stop it, or go under. It will pay well to inquire into the whys of the large grower, if one is so fortunate as to have opportunity.

## Deterioration.

A prominent writer in the Country Gentleman makes the affirmation that the Leghorn breeds are deteriorating to such an extent that it is to-day the exceptional flock that are great layers. Their natural and useful qualities have been sacrificed to form and feather. Doubtless the same might be said and with more show of reason of the Plymouth Rock, for the Rock is exceptionally hard to breed to feather. Yet I have never yet seen a man who would give up the Leghorns, once having had them, unless he especially desired a large carcass. And the second choice, on the farm, is almost invariably the Plymouth Rock, when that favorite has given first place to the Leghorn.

## Balancing Poultry Feeds.

There is a real amount of talk in these days about scientific feeding of fowls to induce regular laying. The foundation idea of this is to so balance the food stuffs that compose the ration that they shall be just fitted to produce so much yolk, so much white, so much shell as is needed. This must be done, too, without interfering with the perfect digestibility of the ration. The proper ratio of nitrogenous to fat-forming items in the feed is supposed to be about 4 or 5 to 1. Any one who will take the trouble to learn the percentages of each in the grains, etc., available to himself, can feed scientifically. And, too, it is very easy to vary, for experiment, a ration thus definitely made up. Lacking the desire to do this work for himself, one may now buy feeds scientifically mixed according to the latest formulas.

## Winter Quarters.

Exhibitors of fancy poultry often come to the place where they find it necessary to hinder the production of eggs. They accomplish this by systematically moving the birds from one pen to another. It is a fact that such removals discourage laying for a time. Yet those who are almost painfully anxious for eggs ignore this fact, neglect to get the pullets early into winter quarters, and take it out in grumbling because the fowls don't lay. The majority may know that removals are said to hinder laying. If they do not believe it, they would be wise to make at least one experiment in the direction of early housing for winter. Other facts might, however, affect the result. For instance, if early housing thus meant confinement, when otherwise the birds might be at large, the question might become one of a choice of evils. But, in justice, the hens should be condemned for neither evil.

## Water as a Medium of Plant Growth.

"There can be no life without water" is the statement with which a certain popular dietetic teacher begins his arguments for free use of water. In the plant world the affirmation is no less true. Indeed, water and air alone form a sufficient medium for considerable development in numbers of plant individuals. The Joint plant, or Wandering Jew, as the Tradescantia is often called, may, in good light, furnish a whole season's pleasure to those who must have "green

things growing," yet cannot compass pots and soils. Nasturtium, too, will give greenery, and often bloom as well. Water Cress, of the same family, has the same pleasant trait as its cousin, while the Coleus will give fine coloring other than green. The measure of satisfaction is likely to correspond with the measure of sunlight. Shade will give growth, but of a weak and spindling sort. Sunshine generally means greater thrift. Sometimes matters can be greatly improved late in the season by taking new cuttings, and beginning afresh.

## Araucaria excelsa.

To the many individuals who are pleased by absolute symmetry, doubtless there is not another plant with more character than the Araucaria. As a decorative plant, it bears the name of being one of the most serviceable in the entire list. Its price has long been almost prohibitive as touching the average purses, but this season small plants are being offered at the low rate of 60 cents a piece. They are much better worth it than many of the more fleeting, though apparently cheaper subjects. A. excelsa glauca has, as its name indicates, a bluish bloom which gives it distinction. This variety is more rare, and, as a matter of course, more expensive, than the first.

## Rose Color in Tulips.

The fortunate ones who have no trouble in forcing Tulips in the window will find that the rose-colored sorts often have a double measure of delight in store for the raiser. Aside from being among the most beautiful and chaste of the Tulips, they take on an added beauty under artificial light. Indeed, there is

scarcely a plant of any kind which contains a hint of rose, that does not light up well at night. This is a point which exhibitors at the floral shows may well consider, and it is of moment, too, to the window grower who makes her plant (with faces turned roomward) a part of the evening's delight. Among Tulips with tints of pink are Marillo (rose, with white), Duke of York (rose, white-edged), Rosa mundi (rose and white), Rose Gr de lin (fine, bright pink,) which is considered by some to be the finest of all, and the rose-colored Duke van Thol.

## A Rustic Begonia.

It was rustic only in the sense that it was country reared, but queenly in fact. It stood in an angle formed by two northeast corners of the house through out the summer, and will be removed this week to a wide north window, which it will have all to itself. Nor is this generosity as to space to be freely credited to that spirit in the owner, for the plant simply demands it. The tall specimen had to be cut back and in, even last spring, because it had thrown itself beyond the large window on every side. And this while four out of five plant lovers are groaning over the difficult, though lovely B. metallica. An absolutely thrifty, fully clothed specimen of Begonia metallica, standing, as this one does, over six feet in its stockings, must be an incredible marvel to the average window gardener. But the man of the house says: "If the plant comes into the parlor again this winter, I shall stay out!" He is tired of giving it room, tired of lifting it, tired of visitors' raptures over its size and beauty.

# A Child's Recovery

## FROM PARALYSIS AND SIX YEARS OF CONVULSIONS

Little Fannie Adams, of Umatilla, Cured of a Dreadful Malady  
A Cure of Unusual Interest—A Reporter Investigates.

From the Lake Region, Bartle, Fla.

For some time past the Lake Region has been receiving reports from Umatilla, Fla., of an almost miraculous cure that had been effected in the case of Fannie Adams, a daughter of A. J. Adams, of that place, and last Saturday a representative of this paper made a trip to Umatilla for the purpose of determining the authenticity of the same.

The family live a short distance from the village, where it was found that the people were cognizant of the cure which had been effected, and were rejoicing with the family in their new found happiness. The father, A. J. Adams, is a hard working honest farmer from east Tennessee, and the family came to Florida four years ago in the hope that a change of climate would be of benefit to their afflicted child. Much of their earnings have gone for doctors' bills, whose services proved unavailing. The representative was greeted by Mrs. Adams, from whom he gained the story of her great trial.

Fannie, the youngest child, was born in east Tennessee, and was seven years old on the third day of February, 1897. When ten months old she was stricken with paralysis, which affected the entire left side. This stroke of paralysis was followed by convulsions, and from the time little Fannie was ten months old, until February, 1897, there was not a single day or a night that she did not have spasms of the most distressing nature. Not a single convulsion, but always three or four, and sometimes as high as ten in one day.

The family was all broken down with care, and Mrs. Adams states that for one year she did not go into her kitchen to superintend her household work. All the fingers of the right hand of the little girl are enlarged and misshapen, caused by her biting them during the fearful suffering. The case baffled the skill of the best physicians, and they were frank to say that they could not determine the cause,

or prescribe a remedy to aid the afflicted child.

But what a change now in that household; for little Fannie has recently been released from her six years of agony, which brings the light of happiness to the faces of the parents.

In January, this year, Mrs. Adams, who had purchased some of Dr. Williams' Pink Pills for Pale People for her fourteen-year-old daughter, determined to try their effect upon little Fannie. After three or four doses, she noted an improvement and she then told the father what she had done. He at once went to the village and bought another box, and up to this time six boxes have been used. The first pills, Mrs. Adams states, were given in January, the latter part, and certainly not earlier than the fifteenth of twentieth, and the child had her last convulsion on February 3d, nearly three months ago. Her general condition has improved in every way, and it was not a month after the first pills were taken when she began to walk without assistance.

The pills were bought at the drug store of Dr. Shelton, in Umatilla. In answer to the question, did he, to his personal knowledge, know that the remedy had benefited Fannie Adams, as was stated by her parents, the doctor said that he was a regular practicing physician, and as such was loth to recommend any proprietary medicine, but still he was ready to do justice to all men, and he did know that Dr. Williams' Pink Pills for Pale People had benefited Fannie Adams, and also volunteered the information that he knew of other children in the village who had been benefited by their use.

Dr. Williams' Pink Pills for Pale People are sold by all dealers, or will be sent post paid on receipt of price, 50 cents a box or six boxes for \$2.50 (they are never sold in bulk or by the 100), by addressing Dr. Williams' Medicine Co., Schenectady, N. Y.

# YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

**T**HROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessed of the story of the life and cultural methods of **Henry Jerolaman**, undoubtedly the **STRAWBERRY KING OF THE UNITED STATES**. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us **One hundred thousand plants of the HENRY STRAWBERRY**, to be used solely as premiums to subscribers to AMERICAN GARDENING. The Henry Strawberry has positively never before been advertised.

THE CONTRACT

*Publishers American Gardening.*

*Gentlemen,*

*I hereby agree to furnish you within the next twelve months in quantities as ordered. One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not sold.*

*Wm. Watson, Jr.  
Bossey Inst. South St.  
Thos. P. Waine*

(Signed)

*Henry Jerolaman*

## The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

## A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one strawberry grower in every town, village, and hamlet can come into a good thing through practising the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

## Taking Advantage of Our Offer:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid.

**FIVE PLANTS** ..Of the.. **HENRY STRAWBERRY**  
Unequaled

And AMERICAN GARDENING One Year.

Present Subscribers are entitled to this Offer on renewal; if their subscription has not expired, it will be dated ahead.

Plants to be shipped this Fall or in the Spring, as you prefer.

## OFFER EXTRAORDINARY

For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, **Five Plants of HENRY STRAWBERRY**; at the same time we will also send **Five Plants to the party subscribing through you**. Thus a club of 10 new subscribers entitles you to 50 plants of this wonderful Strawberry, as well as each individual subscriber to 5 Plants. This is a **BIG OFFER** to all who want to become larger holders of this wonderful Berry, never before advertised. **Time is short, get to work to-day.**

Address **Publishers AMERICAN GARDENING, P. O. Box 1697, New York.**

# Trial Subscriptions

For \$1.00 we will send AMERICAN GARDENING on three months' trial (13 weeks) to four separate addresses, and as a premium, **Five Henry Strawberry Plants** to the one getting up the club. **HUSTLE.**

## Fungous Diseases of the Chrysanthemum.

There are several fungous diseases of chrysanthemums, the oldest known and very common one being the mildew or *Oldium*. This consists of fine, cobwebby filaments that are confined to the surface of the leaf and give it the appearance of being dusted with flour. It is less destructive than most of the other kinds of chrysanthemum diseases.

The leaf spot is one of the leading troubles of the chrysanthemum, and first appears in small brown spots upon the foliage, which increasing in size cause the death of the leaf. The illustration, Fig. 199, is made from a leaf by sun printing and shows the location of the fungus (*Septoria Chrysanthemi* E. & D.) by the dark patches that are generally along the irregular margin of the leaf. Fig. 198 gives a view of the microscopic structure of the fungus. A spore-bearing cavity is seen to the right imbedded in the substance of the leaf in which long slender bodies, the spores, are produced in great numbers shown more enlarged to the left. These spores, unlike many other kinds, are made up of several cells placed end to end. Badly blighted leaves have their surface covered with these spores that have oozed from the small openings into the spore cavities and may be carried by water at spraying time to other leaves and plants, and thus spread the disease.

The Bordeaux or other remedy falling upon these spores kills them either when they are freshly issued from the diseased spot or after they have been carried to the surface of a healthy leaf. All badly diseased leaves should be removed and burned so as to destroy all germs of the parasite.

A second form of blight is shown in Fig. 197, where three plants are seen as they were photographed full length. The fungus causing this distressing condition of the chrysanthemum was discovered only a few years ago, and bears the long name of *Cylindrosporium Chrysanthemi* E. & D. It is a more rapid grower than the *Septoria* previously considered, and the affected plants are often stricken down so that they can make no blooms. The discoverer, Mr. Dearnness of London, Canada, describes the general appearance of the trouble as follows: "The fungus can be easily recognised by the dark blotches usually about half to three-quarters inch in diameter. In these blotches are found the spore heaps or pits and beyond them the leaf turns yellow; not long afterward the whole leaf shrivels and is drawn downward to the stem." This condition of things is well seen in Fig. 197 where an almost entire collapse of the foliage is shown.

Some varieties are much more susceptible than others to this *Cylindrosporium*, and growers will need to take careful notes upon this feature of the trouble and be guided accordingly.

A single leaf that is badly blighted with the blight in question is shown in Fig. 200. The large dark spots are located with order, and the remaining portions having lost the character

istic green color, the leaves present anything but a healthy appearance.

There are other fungi that interfere with the growth of chrysanthemums, as for example, one that attacks the cut-

FIG. 197.—THE CYLINDROSPORIUM CHRYSANTHEMUM BLIGHT.

tins and causes a large percentage to damp off before the roots and buds start into growth.

Last, but not least, there is a genuine rust, probably *Puccinia Tanacetii*, D. C., that has made its appearance upon the *Chrysanthemum* during the past season in an alarming extent, and of which the first announcement was made in *AMERICAN GARDENING* for October 2, page 682. One florist has written me that he may lose his whole crop. This rust appears upon the foliage in numerous small chestnut spots, somewhat raised above the skin, through which the fungus has pushed itself and produced the heaps of oval brown spores. In general appearance it is not unlike the rust upon *Carnations* to which it is closely related; but here is no reason to suspect that they are identical.

This rust is a fungus that establishes itself all through the plant before it begins to produce the rusty spots, and there is but little hope of relief in spraying. The better method will be to pick off all affected leaves and burn them.

The remedies perhaps have been treated sufficiently in describing some of the diseases, but here are some remarks that apply to all cases that may serve as a concluding paragraph. In the first place the stock from which *Roses* and *Chrysanthemums* are to be propagated should be of the very best. Here, as with other plants, a weak, diseased plant may be expected to produce its kind when cuttings are taken from it. There is in the second place much to be done in the study of varieties and their susceptibility to fungous diseases. If there is a predisposition, so-called, to disease, the grower should, if possible, know it and turn aside from such sorts. For example, the *Chrysanthemum Golden Wedding* has been swept off by disease in many places successively for years, and growers should rank this otherwise superior sort accordingly. In the third place, the blighted parts when they first appear and are few in number should be picked off and burned.

As a last resort as here mentioned, but not in fact, is spraying; and if the grower is to use a fungicide it is wise to begin with it early and spray faithfully until blooming time. The Bordeaux is the standard mixture, and is made with varying proportions of the ingredients, but the following is satisfactory: sulphate of copper, six pounds; lime, five pounds; water, 60 gallons.

Dissolve the sulphate in a few gallons of water; slake the lime and add a few gallons of water to it, dilute both to hold the total amount, and unite, stirring constantly. If a limeless mixture is preferred that the foliage may be kept nearly natural, it may be made by dissolving five ounces of carbonate of copper in three quarts of ammonia and adding 50 gallons of water. The carbonate may be added to the ammonia, and the mixture diluted as desired for use. While not quite as effective as the Bordeaux, this fungicide has the advantage of not coating the plants with lime.

In writing the above notes the author has drawn liberally upon his previous published observations as found in the various reports of the New Jersey Experiment Station, an address upon "Fungous Diseases of Ornamental Plants," before the Massachusetts Horticultural Society, and an article upon "Fungous Diseases" in *The American Chrysanthemum Annual* for 1895. The cuts are from the same sources; figures 197 and 200 by permission of the American Florist.

BYRON D. HALSTED, Experiment Station, New Brunswick, N. J.

One hundred plants of the wonderful *Henry Strawberry* are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## Notes From the Tennessee Exposition.

The law of the natural progress of man from rudeness to convenience, from convenience to elegance, and from elegance to nicety, is powerfully illustrated in the Tennessee Centennial, where the triumphant works of art, architecture, and agriculture, of the present day stand out in bold contrast with the conveniences and achievements of the pioneer of a century ago.

If the refinement of a people is to be

FIG. 198.—CHRYSANTHEMUM LEAF SPOT FUNGUS MAGNIFIED.

measured by the flowers they cultivate, then here we have an index to the highest type of civilization, for nowhere within all the industries represented are the lines of progress more conspicuously drawn than in horticulture.

Exposition Park is a magnificent tract of highly blue grass land. It is delightfully elevated; shaded with trees of mature growth, and watered by natural springs—strikingly adapted to the fancy of the landscape gardener.

Mr. Joslyne, superintendent of the grounds, has ably proven his ability as an artist. The beautiful lakes have been

FIG. 197.—CHRYSANTHEMUM LEAF SPOT.

constructed, the walks planned, the flower beds laid off, and the trees planted in a way that happily unites beauty and utility. Greater diversity within the same space and with the same means is hardly possible; with every different view a new and entirely distinct plan presents itself, and the idea of monotony is no where suggested.

Some idea of the extent of this work may be had by giving the quantity of plants used. Throughout the ground there are 380 flower groups, comprising more than 16,000 *Roses*, 30,000 *Cannas*, 50,000 *Coleus*, 50,000 *Alternantheras*, 20,000 *Vincas*, 4,000 *Geraniums*, 2,000 *Tuberoses*, 2,000 *Caladiums*, and an endless variety of other plants in proportion.

A most impressive view of both landscape and floral gardening presents itself to the visitor immediately, as he passes under the stately arches of the main entrance. One instinctively pauses by the old mill-wheel on the bridge that spans Lake Katherine and admires the beautiful reflections from her placid bosom, the overhanging boughs and branches, and looks out with rapturous eye through the stately trees that stand like sentinels on her banks, to the magnificent grounds and buildings of the beautiful "White City," appearing in the immediate distance.

Reluctantly passing through the lovely woodland, laden with fragrance of the *Heliotrope* and *Tuberose*, and afire with *Cannas* and *Coleus*, and bearing to the left, we come immediately in front of the Mexican building. Looking from here to the northwest, the brightest and most delightful picture on the grounds is effectively presented to our view. Here is a space of several acres laid off and planted in a manner highly commendable to all concerned. Just in front is a large triangle of two-year-old *Roses* in variety by Messrs. Joy & Son, which have been a mass of bloom from early spring. To the right *Canna* beds by the Centennial Company are in the lead; to the left is a beautiful lawn interspersed with *Palms* and *Rubber trees*.

Taking the central walk to the juncture of the avenues leading from the Woman's History, Auditorium, and Government buildings, we find the stately electric fountain, within itself a most unique and imposing work of art and worthy centerpiece to the rivalling collections which surround it. From its middle and lower basins are *Water Lilies* shown by Mr. Moulder. Representatives of every color and species from every clime are presented in effect more striking than words can picture and illustrates with force the ascendancy of water gardening, or systematic horticulture without the use of hoe or hose.

Around the fountain is a gorgeous flower bed 200 feet in diameter, cut in sections by the walks. The principal beds are by F. R. Pierson Co., and consist of *Hydrangeas*, *Palms*, *Roses*, and similar bedding plants tastefully edged with *Coleus* and *Achyranthes*.

Leaving the fountain and looking to the right is a beautiful lawn extending down to the auditorium and front to Gourd Arbor. In this are three large circular and oval *Canna* beds, varying in size from 50 to 80 feet, exhibited by the Pierson Co. Near the fountain in this section is a *Cactus* bed 75 feet across that contains some rare, magnificent specimens and, like the *Water Lilies* just passed, command applauding remarks from every passer by. Looking to the left is a large green lawn bordered by 50 leading commercial varieties of *Roses* by Dingee & Conard. To the front is the famous Gourd Arbor, or "lovers' bower." Here the weary rest and the pensive dream under the shade of the mingled foliage of every variety of gourd known in the South. It is a delightful spot to every lover of comfort, as well as every lover of romance, while to the "knightly gallant" and the "queen of coquetry" it has proven a sweet trysting place. "So Jonah was exceeding glad of the gourd," may be truly adapted to every weary pilgrim who enters here.

Crossing the Gourd Arbor from the Electric Fountain, the grounds around the History building meet our eyes. Quite a distinction between this and the beds we have just left, for about the fountain it is a massive array of crowded plants and showy colors, as if space were at a great premium, while here the extensive green is sparsely dotted with modest beds of *Heliotrope*, *Petunias*, and such things as seen around a suburban or country home. On the lower side of the large lawn reaching toward the Auditorium is a fine bed of *Bananas* and other tall tropical growing plants. On the upper lawn towards the Children's building is a beautiful 75-foot bed of *Cannas*, centered with *Ricinus* and edged with *Caladiums*.

Back of the Woman's, Children's, and Administration buildings is an exquisite wooded lawn, with chair swings and settees which prove a most inviting place through these long hot days.

From the main entrance of the Auditorium extends the Grape Arbor. It is covered with an endless variety of wild and cultivated vines, and in general appearance is not unlike the Gourd Arbor. On both sides of this arbor is a lovely sward of green and in the center of each plot is a 100-foot Canna bed edged with Caladiums.

The most striking display of tropical bedding plants is the exhibit of the Plant System in front of the railway exhibits. It seems that an half acre of the most luxuriant variety garden in south Florida might have been dug out in a body and transplanted here. Cabbage Palmettoes 20 feet high, waving with Spanish Moss, magnificent Palms, Araucarias, Jessamines, with numerous tropical foliage and flowering plants never seen bedded in the North, are growing in one luxuriant bouquet. Oranges, bananas, pineapples, lemons, and other semi-tropical

name, meet the admiration of every passerby and stand to evidence his skill.

On Capitol avenue the most attractive spot is the little grotto in front of Rialto. Wild flowers and Ferns growing around the cave whence issues a spring which feeds a miniature lakelet for another exhibit of Mr. Moulder's Water Lilies.

In the State agricultural exhibit in front of the Agricultural building on a four-acre farm, may be seen growing every variety of Indian corn, sorghum, hemp, jute, millet, flax, clover, alfalfa, grasses for grazing and hay, and all other agricultural products common in Tennessee. Three-fourths of an acre are planted to tobacco. Uncle "Scot" Walker, whose life has been spent in the tobacco patch is here continually showing the visitors how to grow and cure the weed. Uncle "Ned" Wood, a veteran cotton grower, whose kinky head now begins to reflect the color of an open pod, has charge of an acre of this crop, and says he never grew finer cotton in Georgia. Uncle "Ned" takes great pride in showing his large plants, some of which he says now have 224 "squares and bolls."

## Chrysanthemums.

Intending Exhibitors will do well to be getting out their schedules and looking up the dates of the shows. [A list of forthcoming exhibitions, so far as we have been informed, is given on page 719.—Ed.] Make a careful study of the classes and remember one or two reasonably sure prizes are better than trying to get the whole show. Send in your entry to the secretary in good season to facilitate his work; he has plenty of troubles of his own without your adding to them. While most shows are about a week earlier than usual, flowers seem at present a week later and consequently more of the earlier varieties will be brought into competition. All this is as it should be. A better show can undoubtedly be got up about the first week in November, as the great bulk of varieties are in flower at that time. Chrysanthemum cranks will soon be in their glory and no one is more of a Chrysanthemum crank than I; some are born to Chrysanthemums and others have Chrysanthemums thrust upon them, but all alike get bound captive with their fetters of beauty, even the Rose grower (who in this section is pretty numerous) and who bewails and belittles our queen, cannot resist, try as he may, and in some corner of his house you will find a few plants he has not the heart to throw away.

Reader, you may not be a professional grower, and your stock may consist of half a dozen plants in the back yard, but you can get the fever just as well notwithstanding. While most fevers will pull you down, the Chrysanthemum fever only elevates and lifts you up and makes you see life through a halo of pink, gold, and white. There are no blue Chrysanthemums, and there should be no blue Chrysanthemum lovers, and if the notes in previous issues have instilled into you a love for the Golden Flowers, or have helped you to grow them this year any more successfully than in the past, they have not been in vain, and with the fond hope that such has been the case, this present series draws to a conclusion. Let the results decide! C. TOTTY, N. J.

FIG. 200.—CHRYSANTHEMUM LEAF BLIGHTED BY CYLINDROSPORIUM.

## Our Supply of Bulbs.

To the Editor of American Gardening.

Speaking of bulbs, page 680, "Xeno" voices the correct ideas. Why can we not grow our own bulbs along the Atlantic coast just as well as in Holland? Simply because we don't try! Professor Massey is experimenting in North Carolina, and I am awaiting his report very anxiously—if it ever comes. Of course it is for the benefit of North Carolina people, and it may be held exclusively for their benefit; time will tell.

I am not precisely a "nurseryman," but may be some day, and would certainly like to have "Xeno's" address. I take great interest in "experimenting" in all forms, and am quite successful. Four years ago I started with two "offset" roots of a specially fine Calla, and have over 2,000 roots now in all stages of growth and sizes, besides selling upwards of 200 blooming plants during the last two seasons.

It is certainly a shame for any seller of plants to "substitute." This is the prime cause of so many seedmen and nurserymen having the name of rogues and frauds besides causing such confusion in the names of varieties. It often occurs in my trade that certain varieties are diametrically opposite in color, habit, etc., to the true type, especially so in the newer, well-advertised kinds, and this not only in flowers, but in seeds as well, and I am sorry to say, bearing the name of well-known firms. Why it is so, I am unable to say; there are so many loopholes of escape that it is impossible to bring home indisputable truth.

My soil seems especially adapted to the Calla, and they can be sold very low at a fair profit, I believe, and the more extensive the crop the cheaper. I would like to know the average prices at wholesale for blooming size. Can you inform me.—HENRY SNYDER, Oxford, Md.

## An Ornamental Bed.

To the Editor of American Gardening.

I do not expect the ornamental bed I am going to describe will meet the wants of "D. U. X.," whose enquiry on page 678 suggests this letter, but perhaps some one else will get an idea.

This bed has in the center nine dwarf Cannas (Charles Henderson); around these were planted the tubers of the spotted Calla about three inches apart; next the bulbs of pink Zephyranthes, and then the dwarf Geranium, Mme. Salleri. The spotted Callas and Zephyranthes blossomed at the same time early in the season. One of the Cannas died near the center of the bed, so I put in a plant of Cosmos and kept it pinched back even with the Cannas, and it was a beautiful bed, the dark scarlet blossoms of the Canna with the fine feathery foliage of the Cosmos was very pleasing, and the leaves of the spotted Calla, even when there were no more blossoms were very handsome, and the pink blossoms of the Zephyranthes just above the green and white Geraniums made a fine border.—W. H.

fruits are seen maturing fruits as at home. The beds are artistically edged with sea-shells and rocks and everything is kept in prime condition, displaying an unwritten advertisement for the undeveloped South.

On the island in Lake Watanga, front of the Negro building, is a flower bed worthy of special notice. It is 200 feet long, covering the whole island. In the center is a large, showy bed of Coleus surrounded by a large urn of Palms. Next are Crotons—every variety known, together with several new ones never before exhibited. Near the water are growing Cannas, Caladiums, Typhas, Callas, and other sub-aquatic plants.

Lily Lake, near the Transportation building, contains the Water Lily exhibits of Gus B. Moulder and of Joy & Sons. One or more hardy Water Lilies grown together with Victoria regia and other tropical sorts are furnishing thousands of blooms to attract the passing throngs.

If Mr. Joslyn, the gardener, has a preference above the grounds around the History building, it is the sun-ray bed on the southeast end of the Forestry building. Six thousand Coleus arranged in the novel style which suggested the

### Storing Celery.

What is the best way to keep celery through winter? I have always put it in trenches one foot wide in the lot and covered it with dirt and cornstalks, but it does not keep. I have a good dry gravel bottom cellar to my house where there is no furnace; why would it not be a good plan to pack the celery in sand in this cellar? I have the Red Rose, Boston Market, Giant Pascal, and Golden Self-Blanching.—T. M.

—This is a pertinent and seasonable question, and being of general interest at this time, it will not be inappropriate to reply to it at some length.

In a dry, cool cellar as described above, it will be possible to keep celery for about two months after putting it in. Any that may be required for use later than that, had better be left outside in trenches. In a cellar that is fairly light, celery will sometimes keep longer than just stated if small and sown late, and not blanched outside before placing it there. Dig up the plants carefully, with all the roots available, stand it upright against the wall about four to six inches apart, one row at a time—then cover the roots with sandy loam or sand. Then proceed again as before by placing another row of plants and cover with sand and so on until the quantity required is placed, or space is utilized. Keep the rows six inches apart, as if too close together they will heat up and commence to rot immediately. Air should be admitted as much as possible whenever the weather is not too frosty.

Celery for winter should not be blanched, only just enough for immediate use, as it will quickly blanch as soon as stored away in its winter quarters. It is well to bear in mind that unblanched celery will withstand several degrees of frost without any bad effect, but blanched celery is very susceptible to frost; for this reason it should be stored much earlier than the other which had better be left out until near Thanksgiving, or as late as possible, according to the weather outlook. The best time to put it in is from October 20 to November 20, according to latitude and section of country.

Last fall being so open and mild, a great deal of celery was put in a month too soon, consequently it did not keep as long as it otherwise would have done. We made this mistake last year, and the lesson taught will not be forgotten, as our celery was out by February 1, when it should have kept until April 1. There are so many influences working against the gardener, that when a slight frost comes he gets nervous and cannot feel contented until all his crops are stored away safely.

It is a better policy at the first appearance of hard frost to store away one-half the crop, leaving the other half growing outside as long as it is possible to do so. Frequently we experience two or three weeks of fine weather after the first frost that is sufficient to damage the blanched celery, but not the unblanched.

Trenches one foot in width and as deep as the tops of the plants, make a very convenient and safe plan for winter storage. In these pack the celery not too close, if they have a ball of earth and good roots, the latter will not need be covered with sand, leave exposed to the weather as much as possible, and cover with some light material before frost; taking this off again in the morning, if the temperature is above 35 degrees, as colder weather approaches, heavy covering is necessary.

Some air space should be allowed between the tops and the covering. For this purpose old boards or pea brush may be used laid over the celery, to hold up the covering.

If the new way of growing celery in rows on the level is prevalent, an excellent plan, to have fine celery late in winter, is to cover it just where grown. If three or four rows of celery at 15 to 18 inches apart are left, then as cold weather is near, make a rough roof over it by laying boards or sticks upon supports, upon these place a quantity of old cornstalks, then cover with leaves, salt hay or strawy manure, enough to keep out the frost, or any spare 6x8 hotbed sash may be used instead, these if laid across

and covered with straw, etc., will keep out frost and water successfully. This method is well worth trying, as the best flavored celery will be secured, since it retains that peculiar nutty flavor found in well-grown celery.

A few years ago, after filling the trenches and cellar we had some 300 rather small plants left over, we did not like to throw them away, although they were not needed. On the north side of an outhouse in an entirely out-of-the-way corner was a trench 1½ feet wide by 2 feet in depth. Into this we finally set the plants Thanksgiving week, and about a foot above the plants we nailed a rough roof of old boards, and covered it with a foot of soil, and strawy manure and rubbish were thrown upon it to exclude all frost. The plants were then left and forgotten all about until April 1, when the manure was being turned over to rot for spring use, but most of it was still frozen hard. It was nearly May when the celery pit was opened, and every root had grown and blanched out into fine medium-sized celery, and very toothsome. This supply lasted until within a few days of June, and was very highly appreciated. W. M. EDWARDS, Conn.

As it has a seasonable bearing, we reproduce herewith an article which was given in an earlier issue:

"After testing the various methods of storing celery for winter use, I am con-

essential to late-keeping celery, viz. a late growth." I. L. POWELL.

### The Late W. A. Stiles.

William Augustus Stiles, whose death was briefly noted last week, was a Park Commissioner of New York City, and managing editor of Garden and Forest.

Mr. Stiles was born at Wantage, N. J., in 1837. He graduated from Yale College in 1859, and later taught in his father's school, Mount Retirement Seminary. Subsequently he spent several years in California as a young man, and was for a time a member of the engineering corps of the Union Pacific Railway. Later he dropped into politics. He was a Republican, and ran for Senator in 1880 and '83, but was defeated both times. He filled the office of Clerk in the New Jersey State Senate in the years 1882-84-85, and was at one time United States gauger in New York City. Drifting into journalism, he became a member of the staff of the New York Tribune, and acted in the capacity of agricultural editor of the Philadelphia Weekly Press. In 1888 he became managing editor of Garden and Forest, under Professor C. S. Sargent by whom that journal is still conducted.

Mr. Stiles was appointed a park commissioner for New York City, by Mayor Strong in 1895, in which office he rendered valuable service, having given the subject of park making careful study.

FIG. 201.—SUCCESSFUL STORING OF CELERY.

vinced that, for my own purpose, at least, the one I herewith describe is best. I use Giant Pascal and New Rose for winter, and plant three rows close together (six or seven inches apart), and the plants about the same distance apart in the rows. The ground is heavily manured before planting and the plants are kept well watered and cultivated. They are given but one slight earthing up until slight frosts set in. Stakes are then driven in along the two outside rows, giving the tops a slight inclination towards the central row, and having the tops of the stakes about level with the tops of the celery. Earth is then banked up about two-thirds of the height of the plants and made firm. A ten-inch board is then set against the stakes on each side, and the earth is banked to a level with the top of the boards. Two more boards are nailed together at right angles to one another and these are placed over the top.

"Some straw is placed alongside of the rows and is put over the boards during a sharp freeze. In mild weather both straw and boards are removed entirely. This is all the protection that will be needed until severe winter weather sets in, when the whole bank may be covered with leaves, straw, and litter of any kind. The accompanying sketch may present a clearer idea of this method.

"The point that appeals most strongly to my fancy is the fact that the plants are stored just as they grew and that they are able to continue growing, not having been disturbed at the roots, thus giving them the opportunity of making what is

His name has been prominently before the public recently in connection with his determined opposition to the adoption of the proposed plans of the Botanical Garden as submitted and amended by the Botanical Society.

The deceased showed early the traits which have characterized his brilliant career. When but a boy he developed a great love for reading, and in his youth associated himself with men of strong intellectuality. He studied botany in his younger days, and gratified his tastes in this direction in later life. He was a polished writer, his style being pure, direct and clear, and he grasped with an easy familiarity the most difficult problems.

As a public orator and post-prandial speaker he was a great success, his marked individuality shining forth in all his utterances. Deceased was never married.

Mr. Stiles was a member of the City Club, Yale Alumni Association, University Dining Club, Century Club, and New York Press Club.

### Fruits Named.

(To T. M. H.)—The red apple is Haas; the green one Fall Pippin.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

## City Shade Trees.

(Concluded from page 682.)

Another tree worthy of a city place is *Plantanus occidentalis*, a showy tree in many ways, excepting the short period in early summer, when in some places the dropping of diseased foliage occurs, otherwise it is a broad attractive tree in foliage, and by reason of the irregular shedding of portions of the bark from the trunk and main branches, when the light yellow patches on the ashen-gray round give the trees a peculiar appearance. These trees flourish best on a low moist situation.

The American Elm brings to mind a tree scene by artificial light; in the old town of Plymouth, Mass., where this magnificent tree makes a canopy through which gleams countless stars, and we thought then, this cannot be eaten. It is a perfect street tree. But the road here is not water-proof by any means. Yet we can find some very decent specimens of it in our squares, not forgetting the fine specimens found about New Haven, Conn., and one growing on the

this was nothing unusual, and judging by the flourishing condition of the trees at the time would appear to be unnecessary work. Yet in the park of Babelburg Palace, slight depressions were formed in the sward about many of the large trees. Here were the finest trees of the Golden Poplars it has been our good fortune to see and from the prominent position in which they stood, could not well be overlooked by the most ordinary visitor, as looking from one of the palace fronts down a broad vista toward the river Havel, these trees stood out like pillars of gold against the backing of Purple Beech by the river. This is wandering somewhat from the city shade trees, but the sight of these has often been recalled to mind by smaller specimens. We remember seeing these trees used a great deal in Vondel Park, Amsterdam, but there it was overdone. The tree does not live long in this country, but it could be used advantageously while young to brighten up some of the dull, dusty corners in the city parks.

A few others of this family are first-rate city trees, that is, they will stand

If in sunny spots more of our native Dogwood (*Cornus Florida*) were used, it would add rustic beauty to many otherwise stiff sections.

Coming to evergreens those that will make a fair showing are indeed scarce. First may be placed *Pinus austriaca*, stiff and of rugged growth, but not very long-lived. The Scotch Pine (*Pinus sylvestris*) does well, but takes on that decided pine characteristic—dying of the lower branches in a few years.

*Pinus Mughus* is useful as a dwarf, being little more than a large bush.

*Pinus strobus* (White Pine) is very good, and when old makes a grand sky line, and at such times has been called The Palm tree of the North.

In Spruce, *Abies alba* and *Abies canadensis* are about the best.

These notes are intended for small squares, in the dense centers of population, well knowing that to wander through and see the variety used in Central Park, New York, and Prospect Park, Brooklyn, these spoken of would seem a ridiculously small number. But the majority of people for which such city parks are needed, have not to spare either the 10 or 15 cents to reach the great parks nor yet very often the necessary time. Therefore, it is believed that half a dozen good shade trees within one-quarter of a mile are far superior for bodily comfort than a park with a thousand specimens located two or three miles away, and which can only be reached by the many tollers once a year, or on high days and holidays. J. H.

## Japanese Tea.

Several months ago, the Japanese Tea Guild sent to this country a special commission, composed of Mr. S. Mitsuhashi, President of Shizuoka Prefectural Assembly, and Mr. J. Ohara, member of Japanese Parliament, to investigate the condition of the Japanese Tea trade in the United States and Canada and to co-operate with Mr. T. Furuya and Mr. T. Mizutany, the American representatives of the Japanese Tea Guild, in giving publicity to the merits of Japanese Teas and the method of preparing them for drinking which would insure the best results.

Mr. Furuya and Mr. Mizutany are planning to open Tea Bazaars in many of the principal cities in the United States and Canada, where ladies can enjoy a cup of fine Japanese tea made by experts, and at the same time receive instructions which will enable them to make it equally well at home. More than half the tea consumed in the United States and Canada is of Japanese growth, yet, the majority of Americans apparently do not understand how to prepare it so as to develop the delicious qualities which it contains. It is believed by these gentlemen that, when Americans are in possession of the secret of making good tea, the consumption in this country will fully equal that of Europe in proportion. The Japanese government has appropriated a large fund to aid the Japanese tea growers and tea merchants in prosecuting this educational work, and it is hoped that American ladies will be apt students.

## Moving the Great Grain Crop.

The wheat crop of the United States for this year of 1897 is estimated at 500,000,000 bushels, one of the largest crops on record, and fortunately for the farmers the European demand has raised the price, and is sending the golden grain eastward at an unprecedented rate. Over 200,000,000 bushels will be demanded by the Old World, says Harper's Weekly, and the shipment of this enormous bulk is taxing the capacity of the railroads and grain-carrying vessels on the lakes, of canal boats and ocean steamers to the fullest extent.

One hundred plants of the wonderful Henry Strawberry are offered as a premium to the raiser of a complete club of Ten New Names, with an additional supply of plants to each person in the club. Read particulars elsewhere.

FIG. 202.—THE LATE W. A. STILES, MANAGING EDITOR GARDEN AND FOREST.

highway at Glen Cove, L. I., measures, trunk  $15\frac{1}{2}$  feet in circumference at 3 feet from the ground; at 14 feet it divides in two immense limbs, which spread in all directions, making a circle of 96 feet in diameter, and combining in one the two important qualities, majesty and grace. It is one of the most easy trees to transplant, and will grow well with no more attention than is given to the majority of city trees.

The number of these trees used in European cities is surprising. In Brussels the principal trees were American Elms or *Plantanus orientalis*. We noted a very pretty effect in one of the small squares here which was planted entirely with *Pinus campestris* var. *horizontalis*.

In Berlin, Germany, the Linden holds sway, and the amount of attention paid to the trees in the way of labor was a revelation to me; great trees on the street would have depressions formed about them to receive the water given them, and later would be filled in and smoothed over, by what could be learned

considerable smoke and dust and grow vigorously, as such we may name *Populus grandidentrata*, *P. tremula*, *P. nigra*, and *P. Bolleana*, this last being of a close columnar habit and with foliage of a refreshing shade of dark green on the upper side, and silver-white beneath.

*Sophora japonica* is a good tree for city work with light-colored foliage.

The *Allanhus* that has fallen from grace because of the offensive odor of the flowers can be used to good purpose, if cut down almost to the ground every year; treated in this way, in a position backed by foliage of a dark green it will hold its own against almost any of the plants used for sub-tropical effects.

*Catalpa bignonioides* and *Fraxinus americana* are excellent trees. The former is very showy when flowering in July, atoning then for the considerable litter made by the falling long seed-pods in late spring.

Several of the *Magnolias* are good city trees, *M. conspicua* being perhaps the best with its wealth of blossoms in May.

# AMERICAN GARDENING

\$1.00 a Year. Every Saturday.

An Illustrated Weekly Journal Devoted to Gardening and Fruit Culture in the Open and Under Glass, and Record of Current Events in Horticulture.

Entered (weekly form) as second class matter at the New York Post Office, January 14, 1894.

PUBLISHED BY  
A. T. DE LA MARE RTG. & PUB. CO. LTD.  
ROSE AND DUANE STS.,  
RHINELANDER BUILDING, NEW YORK.  
Telephone, 2154 Cortlandt. P. O. Box 1697.

REGISTERED CABLE ADDRESS  
Commercial Cable) Florex, New York.

## Publishers' Announcements.

Checks, Money Orders, etc., should be made payable to JOSEPH MACILL, Treasurer.

Terms—Cash in advance. Change of address on mailing tag indicates a receipt.

Subscriptions—Our mailing list is corrected up to Tuesday in each week; remittances received later in the week will be credited in following issue. After remitting please watch the date on your wrapper and inform us of any failure to credit same.

Missing Numbers.—Subscribers failing to receive their copies will confer a favor by promptly advising us with present (and past) FULL ADDRESS.

Remit by Express Money Order (which is safe, convenient and expeditious), Draft, Post Office Money Order or Registered Letter.

This paper is mailed regularly to its subscribers until a definite order to discontinue is received and all arrears are paid in full.

## Communications

To insure prompt attention, should be addressed AMERICAN GARDENING, P. O. Box 1697, New York. Communications relating to the contents of the paper, manuscripts, etc., offered for insertion in its columns, should be specially addressed to "The Editor." Forms close Tuesday evening.

## Advertisements

In order to insure insertion, must reach this office by Tuesday night of each week. Rates, 25 cents per square line; in "For Sale" column, 3 cents a word. Write for special discounts on yearly or large orders.

AMERICAN GARDENING is the official organ of the New Jersey Floricultural Society, the New York Gardeners' Society, and the American Institute Farmers' Club.

## The Henry Strawberry.

Arrangements have been made whereby a bountiful supply of these plants will be ready for spring delivery to subscribers and agents, and in this connection we beg to call the attention of our readers to our generous offer of these plants in another column. We do not think that a more liberal offer has ever been made than the one now advertised, whereby the agent or worker sending us in a club of ten new names, at \$1 each, becomes entitled to 100 Henry Strawberry plants, while five plants will be sent postpaid to each person in his club. This offer will not apply to a club of less than ten. It may be a very long time before such an offer of such a plant can be made again. The wonderful success which has accompanied our premium offer this fall, in the short time at our disposal to advertise it, leads us to believe that the orders for the Henry Strawberry next spring may exceed all anticipations; however, we have planned for a large supply for delivery and trust to be able to meet all demands upon us. Mr. Jerolaman's series of articles is now being placed in pamphlet form, and copies will be mailed free to all who desire to use same in the canvas for new subscriptions.

All the premium Henry Strawberry plants due to date, have been shipped, except where a request has been made to hold them till spring, and judging by the unsolicited acknowledgments received, they are giving immense satisfaction. In order to reduce weight and hinder excessive transpiration some of the leaves are cut off before shipping, this is especially beneficial during a hot spell, and readers can rest assured all is done for the best.

## Fruit at American Institute Fair.

The fruit display from the New York Experiment Station, Geneva, at the American Institute Fair, was the focus point for all fruit growers; to it they turned for help regarding the knotty points on nomenclature, and to admire the splendid samples. There is as much beauty here as in the flowers and we spent a few very interesting hours there, held not by the display only, but also very much by the verbal expressions heard concerning it by those interested and those that were not.

The apple display came in for the lion's share of comment, and it is hard on the Geneva people, but very pleasant for the fruit industry, to overhear that three-fourths of those growing apples could beat the station specimens in size (no doubt but that distance lent enchantment to the size in some cases), but no one was heard to remark that he had more kinds, which may be some comfort to the Geneva station, and induce them to stage 280 kinds next year, and possibly mark on the cards, the approximate season of ripening at Geneva. This on the plums would have made the exhibit much more interesting.

On entering the hall an attractive feature was a display of fruits from P. J. Berckmans, Augusta, Ga., which made a rare collection for the Northern man and comprised guava, persimmon, pomegranates, in several varieties; silyphus, also a new quince Pineapple, and sample of Campbell's Early grape, and some immense Kieffer pears fully four times the size of ordinary Kieffer. On the same table were several glasses of guava jelly. Looking around for the Geneva exhibit, we found that it had overflowed from a large room given, and the 50 varieties of pears now made a side show. The most noticeable of these was a plate of Souvenir de Congress, some wonderful fruits before which Bartlett must bow (for size), for they looked as if two pounds would be about the right weight. Next door, as it were, our good-for-ever mite of a Seckel bobs up, and a short distance away a namesake, Bart Seckel, having the same shining cheek, but about three times the size. One would have liked to have been able to learn more about its flavor. Many of the old favorites could be seen, with a sprinkling of good-for-nothing-but-show varieties, as Dramyo and Mdme. von Seibold; but here in all its glory was Flemish Beauty, whose dress was so clean that some one had tried to call it by another name, because they could not see the freckles on her face. Making a right-handed turn we found ourselves among the apples, plums, and grapes.

As 180 plates of grapes were no joke to examine in the time at disposal, we decided to stand off and pick out the most promising to the eye and found such to be: in white, Duchess, Niagara, and Moore's Diamond; in red, Lindley, Lucile, Delaware, Brighton, Poughkeepsie, Salem, and Catawba; in black, Concord, Worden, Clinton, Barry, and Eaton. This exhibit struck us as not up to the usual standard in size of bunches, they also being damaged quite some, unavoidable, no doubt, when staging so many varieties at this late date.

But the plums were truly a grand effort; just think of one place being able to stage 81 kinds in the month of October! Still working against time, we began in the same way as with the grapes, until one of the "bosses" came in and invited us to become acquainted with the plum flavor, and it was great, but not all in the big fellows, for of all, a small Gage named Tobias came out A1 in flavor; Grand Duke, large black, is one of the best flavored, and odd in having quite a neck; Duane's Purple is good; Chabot, a red, is of very fine flavor; Coe's Golden Drop is too firm yet to have much flavor, but is A1 when dead ripe.

But to return and sum up the eye notes: in black, by appearance, Quackenhoss, Arch Duke, Grand Duke, and Diamond; in red or purple, Duane's, Pond's Seedling, Bon de September, and Chabot; in green-gold, Yellow Egg, General Hand, Coe's Golden Drop, and Luccumb Nonesuch. The foregoing ranking in size and appearance in order as given.

Burbank was a plum of fine appearance once, but too far gone now to try the flavor of it. There was a number of native kinds, the best, perhaps, being Hawkeye, a light mottled red, of good quality. A large number of crab apples was shown which, with the large kind, made a goodly show of 220 varieties, among which the most attractive are: Tufts, Beltgilemer, Alexander, Wolf River, Pumpkin Russet, Northwestern Greening, Bellordooskoe, and Hartford Rose.

Certain it is that all visitors to the Fair (and all my readers living within a reasonable distance should become such) will feel when they leave, that it has been time profitably spent, and that they will return again before the close. For somewhere among the varied collection of fruits, flowers, machinery, and articles useful and useless, can be found something that will interest everyone any day this month.

## Proposed Botanic Garden for Phila.

At the meeting of Councils' committee on city property, September 22, Dr. William Pepper, on behalf of the Philadelphia Commercial Museum, made a request that 40 acres of ground along the west bank of the Schuylkill be transferred to the institution, to be used as a botanical garden. This plot of ground was dedicated for park purposes by an ordinance of Councils on July 6, 1883, but has lain useless. Dr. Pepper said that a museum of science and arts is to be erected near here at a cost of \$2,500,000, ground having been broken for one wing of the building, and it is desired to make the botanic garden an adjunct to the museum. The matter was referred to a sub-committee.

## Texas Truckers.

The Truck Gardeners' Association for Nueces, San Patricio and Aransas met at Rockport, September 18. There was a general discussion of topics of interest to the market gardener generally and to shippers of vegetables in particular.

A proposition from the San Antonio and Aransas Pass Railway with regard to reduction of rates and promptness in dispatching vegetables, in ten carload lots, was read, discussed and finally accepted.

Next year each county will have a competent agent from the county, under salary, on the ground to receive and deliver goods shipped by any member of the association. Special attention will also be paid to packing, so that the goods will be packed in first-class shape.

## Fruits Received.

**Gold Plum.**—A sample fruit of this has been received from the introducers, Messrs. Stark Bros., Louisiana, Mo. This plum is one of those procured by Luther Burbank from his crossing of Roblison and Abundance, and he himself said of it: "The best plum I have ever produced." The introducers claim that Gold plum bears well wherever natives bear, and in all truth, the evidence offered by well-known horticulturists supports the claim. It should be a very useful variety. In flavor we are inclined to think it will pass muster, but the one fruit sent was bruised in transit, so we cannot speak positively, on that point. The color is most attractive and is of rich yellow-red hue, with yellow flesh.

**Juicy Plum.**—This is another of Burbank's raisings from the same cross as the Gold, and has lately been referred to in these columns (see page 665). It is well named, being very full of juice, so much so as to surprise one on biting into the fruit. In flavor it is of medium quality. The samples examined were sent by John Lewis Childs, Floral Park, N. Y.

**Satsuma Plum.**—This, like many others of the Japanese plums, is not a very satisfactory one for eating out of hand. We lately received specimens from E. & J. C. Williams, Montclair, N. J., and decided to put them to a cooking test, and now think that Satsuma is a grand plum for canning. The beet-like red flesh gives a handsome rich color and the slight astringency is an added charm to the flavor. We will can all the Satsumas we can get.

**Chabot** was another plum sent by Messrs. Williams; it was the true Chabot—a clingstone—and is a first-class eating fruit.

**Grape Campbell Early** has already been alluded to in these pages, and lately the introducer, George S. Josselyn, Fredonia, N. Y., favored us with some bunches of the fruits. The accompanying letter stated they were from one-year-old vines planted in 1895. The clusters were very large, and, as regards flavor, too much can hardly be said for Campbell Early; it is that of the Concord with a blending of the European Muscat Hamburg. The variety fruits with Moore Early and having a tough skin keeps and ships well; the berries also hang well on the bunch.

**Peach Dr. Black.**—Our correspondent, Charles Wright, Seaford, Del., kindly sends a sample fruit of this new late peach. It was not fully ripe, but had been pulled for fear of storms, but it had sufficiently matured to enable us to form a high opinion of its merits. This variety ripens at least two weeks later than Bear's Smock and takes on a high color. The flesh is yellow, melting; free-stone; flavor pleasantly sub-acid and altogether it appears to be a valuable late peach, especially for the South. The specimen was received October 4.

## Died.

**W. C. Wilson.**—A once noted florist and gardener passed away on Saturday, October 9, in the person of W. C. Wilson, of Astoria, Long Island. For many years the deceased ranked as one of the most prominent men in his profession, but of late years, owing to reverses in business, but little has been heard of him. Two years ago his large plant was entirely sold out; since when he has been in the employ of H. Dryer, Woodside, L. I. He was the oldest living florist.

**Fearing Burr**, formerly of the seed firm of M. & F. Burr, of Boston, died at his home, Hingham Centre, Mass., October 4, in his 82d year. In 1865 Mr. Burr published a work entitled "The Field and Garden Vegetables of America," and in the same year wrote "Garden Vegetables, and How to Cultivate Them."

AMERICAN GARDENING is always a welcome visitor to my office. I have to show my friends the many good things it contains every week. Wishing you every success, I am. —DR. T. R. CLARK.

## READERS' NOTES AND COMMENTS.

This space is devoted to short notes of experience and observation, but not necessarily reflecting our own opinions. You, reader are trying new varieties, new implements, new methods. Let us have your verdict—short, pointedly. Possibly you may wish to comment on statements found in this or previous issues or to offer suggestions; let us hear what you have to say. In the multiplicity of counsel there is wisdom and safety. Write us often.

**Hot Water for Poison Ivy.**—Will you allow me to mention another remedy for the effects of Poison Ivy (*Rhus toxicodendron*)? It is simply hot water, as hot as can be borne. It may not work with all, scarcely any remedy does, but the man who told me of it had tried about every other remedy, and by accident discovered the benefit of hot water. Now as soon as he discovers that he has been poisoned he applies the hot water with a sponge or cloth. The first application stops all itching for a while. A few repetitions of the application stop it completely.—W. H. H.

**Where Can I Learn?**—Will you or some of the readers of AMERICAN GARDENING give me some information? I have come into possession of a small place in the country, and intend to spend my time working among my flowers, fruit, and vegetables, but do not want to be at the mercy of my gardener. Therefore I would like some training in care of greenhouse, flower and vegetable gardens. Is there any place where I can go to get such a training, and on what terms? Or have I to go through the hard school of experience to learn what I want to know? I am not altogether green, as I am a farmer's daughter, and my early years were spent in my flower and vegetable garden, but I am not anywhere near up to date, and know nothing about care of glass houses. If any one can give me any information on this point I shall be much obliged.—H.

—The requisite knowledge can only be had by experience.—Ed.

**Strawberries in Louisiana.**—I have better success with plants set late in the fall. The ground spaded deep with plenty of old, well-rotted manure and mold from yard sweeping and ashes, and the best plants I ever had were set out with a trowel. I stuck the trowel half way, then pressed back and forth wide enough for the roots to go in without crowding. Then with the back of the trowel I firmed the soil well, and just let them alone, only pulling out the biggest weeds. I have planted, trying to spread the roots, but I think I did not get them deep enough and when dry weather set in they dried out. Last spring I did not gather a pint of berries; it rained, and all rotted. When we get the "Henry" berries we will only want five for "a mess."—MARGARET E. CAMPBELL, Louisiana.

**Raspberries.**—Frank C. Dowd, in issue of October 2, page 680, asks what to do with the Columbian in regard to pruning young "trees," he calls them. Evidently he has strong plants that are capable of bearing a large crop of fruit. Such plants should be trimmed high, five or six feet; staked and tied up closely, lateral shoots clipped from two to four inches from cane, according to number of branches; soil barely scratched, just enough to kill weeds, and mulched with coarse stable manure for the winter, covering the ground well out from the hill. In case of a dry spring, a barrel of water placed so as to leak over a space of ten feet around each plant, just enough to keep the soil well moistened (not wet) will be pretty apt to give a satisfactory crop.—HENRY SNYDER, Md.

**A Review of the Season in Kansas.**—The season just coming to a close has been a very discouraging one to the grower of fruits and vegetables on account of its extreme dryness. We had it very wet until the first week in April, then we had no rain, only, very light showers until about July 1, when we had a good rain, and we have had none since

in sufficient quantities to thoroughly soak the ground; consequently everything has suffered, especially in fruits and vegetables. Celery especially has suffered; it will be almost a total loss. My own especially is a complete failure. We of this country should be prepared to irrigate, as there is scarcely a season but irrigation would be beneficial. Strawberries and blackberries were badly damaged. Raspberries were a pretty good crop, the rains mentioned coming just at the right time to save them. The Bubach stood the dry weather the best of any strawberry I had.—D. H. B., Kansas.

**The Wilson Blackberries.**—Can you or some of your readers inform me in regard to Wilson's Early and Wilson, Jr., Blackberry, as to size, earliness, quality, productiveness and hardiness in comparison with the Early Harvest?—D. H. B., Kansas.

**Another New Strawberry, The Loyd.**—Seeing you give space for the description of anything new in the horticultural line I would say that we have a new strawberry that was fruited in 1897. It was seen by a great many of our best strawberry growers and it was pronounced to be the best variety ever seen growing here; the plant is perfect in every respect, one of the most healthy, no sign of rust or disease about it, and makes a good bed of plants; in fact, so much was, and is, thought of it that last spring the demand for plants was so great that it could not be supplied, and the coming season is likely to be the same; it is not in the hands of nurserymen yet and is not likely to be in any catalogue the next season. It was found growing on a piece of new ground a few years ago by a Mr. Loyd near the Maryland and Delaware line; it is dark red and shaped like the Sharpless. The blossom has some pollen but needs fertilizing with some other variety. It is a great acquisition to our list of varieties; in fact, any variety that will excel the Bubach is no common strawberry. In conclusion I will say that the Loyd is a new berry of sterling worth, about the same season as Bubach; it's a real bonanza in the strawberry line.—C. HOWARD, Md.

—We regret our correspondent did not send us fruit in the proper season.—Ed.

**Rotation.**—Answers to "G.", page 680. Rotating crops to get the most off of the land is intensive management. If the soil is in proper condition, it will remain friable and light enough to plant in alternate rows, enabling one to get an extra crop during the season, several combined crops can be planted in the same row, with other single crops alternately, thus doing most of the planting at one time; for instance, beans and parsnips or carrots, together in same row, 24 inches wide, onion sets between; or radish broadcast, onion sets, and strawberries alternately in rows 24 inches, making 12 inches between any two rows; or early cabbage, with a berry plant between, berries to occupy the land after cabbage is off; or peas and potatoes in same row, four feet apart, early sweet corn alternate; when peas and potatoes are off, tomato or late cabbages take their places, when corn is off, turnips; scarlet clover or rye to follow, broadcast. A study of time required to mature crops for marketing, will suggest many other combinations for rotation.—HENRY SNYDER, Md.

**Specimen Tree Wanted.**—By way of your valuable paper I wish to get the opinion of some expert in landscape gardening, what tree to plant in a prominent but exposed situation in front of my house. It would be a single specimen on the lawn and I should like to have something extra nice, some tree that has a moderate height and draws the attention of passers by. Will a Weir's cutleaf maple fill the bill or would a *Salisburia adiantifolia*, *Allanhus*, or red-flowering Horsechestnut be more recommendable. Ground is excellent and the house is isolated, out of town, that is not exposed to the disadvantages of a city street.—SOUTH MICHIGAN.

## There is Not a Home in the Land

But calls for a yearly Calendar.

Every family tries to get one or more; generally more.

## There are Calendars and Calendars

Some are good, some bad, most of them indifferent.

## There Will Not be a Calendar Issued for 1898

To exceed in artistic elegance, finish, beauty of designs and effective coloring, the one we to-day offer as a premium to every subscription to AMERICAN GARDENING received before December 31, 1897.

# EVERY SUBSCRIBER IS ENTITLED TO ONE

AND CAN EASILY EARN TWENTY.

OUR magnificent **Rose and Girl 1898** six sheet **Art Calendar**, two months to a sheet, each sheet  $8\frac{1}{2} \times 11\frac{1}{2}$  inches, is superbly lithographed in eleven colors, and printed on hammered paper; the whole tastefully tied with silk bow—undoubtedly a work of art fit for the most elegant home, and as handsome a Calendar as was ever published. Each one of the six designs presents a distinct type of female loveliness and a fresh study in roses, the coloring on each sheet being rendered in harmony with the design. There is not a line of advertising on the Calendars to detract from their value. They will not be sold by us for less than \$1.00 each.

### Who is Entitled to a Calendar?

**EVERY SUBSCRIBER** renewing before **December 31, 1897**, enclosing Five Cents additional to pay packing and postage.

**EVERY NEW SUBSCRIPTION**—To induce people to test the value of AMERICAN GARDENING we will send the Calendar absolutely free to every name received direct not previously on our mailing list. Remit \$1.00 for A. G. 12 months.

**EVERY ONE** sending us a club of Four 3-month trial subscriptions at twenty-five cents each, will get a Calendar, free as a premium, by return mail.

**EVERY NEW name sent in by an agent.**

NOTE.—We have ordered manufactured for us a large stock of these superb Calendars in the endeavor to have sufficient supply for all demands, but will not guarantee to fill orders after supply is exhausted. Therefore, order yours now.

**Special to Agents** A copy of our Art Calendar to show people will clinch the argument and obtain the subscription. Bona fide Agents will be mailed one copy, securely wrapped, on receipt of only Twenty-five cents (one-fourth its value.) Armed with this superb Calendar we misjudge human nature greatly if any ordinary mortal cannot secure a big list of new subscriptions every day. Every new subscriber you send us gets a Calendar by return mail.

### We Pay Agents

Every new subscription at \$1.00 entitles the agent to **Five of the Wonderful Henry Strawberry Plants**, to be delivered next Spring. Thus 100 new subscriptions would secure agents 500 plants; a possession worthy of your consideration. Every new subscriber taken by agent will receive one of our Art Calendars free by return mail.

Agents who do not want the Henry Strawberry Plants can retain as their payment **20 cents in cash** on each subscription they take, or will be credited **twenty-five cents** on any book, magazine or publication they wish to obtain through us.

REMIT BY P. O. or EXPRESS MONEY ORDER—IT IS SAFEST.

## Some Questions Answered.

### Heating a General Greenhouse.

Will you say how I shall arrange the heating pipes for water in a greenhouse, 12x30, with boiler room 10x12, attached, using 1 1/4-inch pipe? Would a two-horse power upright boiler be sufficient? The outside benches are 30 inches, central bench 42, walks between, 20 inches. Flowers and winter vegetables to be grown, and mushroom beds under benches.—COLUMBUS.

—The requirements for flowers and winter vegetables vary to such an extent that it will be impossible to pipe a house so that a temperature suited to all of them can be secured. Thus cucumbers and Roses will require about twice as much radiation as Violets and lettuce. If the walls are not very much exposed and if the glass is all in the roof and ends, a two-horse boiler with a grate 15 inches in diameter should be able to heat to 60 degrees such a house as is described. I should supply radiating surface by means of two 2-inch overhead flow pipes and ten 1 1/4-inch returns under the side benches.—L. R. TAFT.

### Araucaria excelsa.

Does this need a sunny or shady place, and what size does it attain in this country?—READER.

—Araucaria excelsa is perhaps the most extensively grown of any of the Araucarias, and is probably the most easy of cultivation. The most desirable location is the coolest part of the greenhouse. What it likes most is a cool, damp atmosphere. Trade growers who handle large quantities shelter the plants during summer in temporary shelters made of slats arranged two or three inches apart. In the winter they give them a glass house and maintain a temperature of about 43 to 45 degrees. Good sound loam and sharp sand is all the soil needed. As the plant is grown only in a greenhouse here, it has to be kept to the size of the house. In its native haunts it attains a height of 150 feet.

### Fertilizing Strawberries.

(a.) Is hen house manure and ashes good for strawberries?

(b.) Are ashes better without being leached, or are they better after they are leached?

(c.) I have prepared my ground and have put cow manure in drill and broadcasted also. My rows are three feet apart. I thought I would broadcast with hen house manure and ashes.—J. C. HUTCHINS, Ga.

—Hen house manure and unleached ashes mixed with cow manure and top-dressed one foot wide on each side of plants would be best, as otherwise if plowed or spaded in, would be apt to burn roots of plants, top-dressed would grow a fine crop. Must be at least two inches deep.—H. JEROLAMAN.

### Sow Bugs and Mealy Bugs.

Will you kindly advise me whether "sow bugs" and "mealy bugs" are the same? I am troubled very much by what is commonly called "sow bugs," gnawing the young cucumber plants in my greenhouses. What can I do to prevent it? They hide between the side planks of the bed and the dirt in the daytime and do their work at night.—W. F. PRESTON, Ill.

—No! Sow bugs and mealy bugs are very different. The mealy bug is hardly ever more than one-eighth of an inch in length, is soft and covered with a white mealy-like substance—hence the name. This is a pest of certain decorative plants and very troublesome to dislodge. The sow bug or the wood louse is a much bigger creature with a hard shiny shell of a slaty color. Your statement that these intruders attack your cucumbers is not in accordance with the general understanding of the habits of the sow bug, for though some practitioners stoutly maintain that the sow bug devours young plant growth, the entomologists will have none of it. For our own part it has never been sufficiently demonstrated that the sow bug eats the living tissues of plants.

### Wintering Cannas.

Cannas which are at present in the beds, will need attention now in regard to winter storing. As soon as the foliage is caught by frost, cut down the tops, leaving six inches of stem; lift the roots and place them on the floor of a barn or some such place to dry and ripen up. After that they may be stored in a light airy cellar or (where a great many thousands do get stored) under the greenhouse bench. The last-named spot is not an ideal one for storing, as there is always a big risk of rotting, and very frequently there are varieties that will not keep at all when so treated.

Wherever the roots are stored a sharp lookout needs be kept upon them to see that they are all right, otherwise in the spring the grower may find himself minus his favorite sort.

There is more Catarrh in this section of the country than all other diseases put together, and until the last few years was supposed to be incurable. For a great many years doctors pronounced it a local disease, and prescribed local remedies, and by constantly failing to cure with local treatment, pronounced it incurable. Science has proven catarrh to be a constitutional disease, and, therefore, requires constitutional treatment. Hall's Catarrh Cure, manufactured by F. J. Cheney & Co., Toledo, Ohio, is the only constitutional cure on the market. It is taken internally in doses from 10 drops to a teaspoonful. It acts directly on the blood and mucous surfaces of the system. They offer one hundred dollars for any case it fails to cure. Send for circulars and testimonials. Address, F. J. CHENEY & CO., Toledo, O.

Sold by Druggists, 75c.

### Situations Wanted.

Advertisements will be inserted under this heading at ONE CENT PER WORD each insertion, payable in advance. The address to be counted as part of the advertisement. No advertisement inserted for less than fifteen cents per insertion.

SITUATION wanted, as head gardener, competent and experienced commercial vegetable grower; hothouse and outdoor operations. Married; say what wages paid. Head Gardener, care American Gardening.

### Business Cards.

C. D. Zimmerman, Buffalo, N. Y. Horticulturist Landscape Gardener. Plans and estimates furnished

LAND DEVELOPMENT, consultations, plans, superintendence, plants, labor, etc., supplied for work as wanted. 500 original designs for residences, gardens, parks, etc., ready for inspection. Communications solicited from those who require the value of land or residence developed with practical economy. Jos. Forsyth Johnson, P. O. Box 1697, New York City.

### FOR SALE.

Advertisements not to exceed eighty words will be inserted under this heading at TWO CENTS PER WORD each insertion, payable in advance.

The address will be charged as part of the advt., and each initial, or a number, counts as one word. No cuts or display type allowed.

RASPBERRY and Strawberry plants. Chas. O. Nash, Three Rivers, Michigan.

GLASS atwholesale, rock bottom prices. Also paint for greenhouses. The Reed Glass & Paint Co., 456 W. Broadway, New York.

L. C. BOBBINK, Rutherford, N. J.—Dutch Bulbs, Clematis, Magnolias, Rhododendrons, Azaleas, etc. Branch of the Horticultural Company, Boskoop, Holland.

HEADQUARTERS for the Loyd Strawberry Plants; conceded to be the best ever seen in this section; also Miller Raspberry plants. Prices low. C. Howard, Two Johns, Md.

DIRECT from the grower, duty free. Hulsebosch Brothers' Seed, Bulb, and Plant Catalogue is now out, prices very reasonable, anybody who has not received a copy should address Hulsebosch Bros., Englewood, N. J.

BLANCHING CELERY with paper tubes. Celery and onions cultivated in the one drill at the same time. No transplanting, no shoveling dirt, combination and continuous crop from June to November, ten years' practice. Full information one dollar. Richard Branson, Box 451, Syracuse, N. Y.

CALIFORNIA Privet make the finest ornamental hedge, and are perfectly hardy. Fine large plant grown at seashore, two years old, \$3 per hundred. Cash with order. ## PRIVATE GARDENERS.

### Appointments and Doings.

Gardeners and others knowing of recent  
 appointments and movings are requested to  
 forward particulars of the same for publica-  
 tion in this column. No charge is made.

A. Van Leeuwen has been engaged as  
 gardener to Mr. Maxwell, Rockville,  
 Conn.

### Northampton, Mass.

The regular monthly meetings of the  
 Horticultural Society which have been  
 suspended during the summer months  
 were resumed on Tuesday, October 12,  
 when Professor Ganong of the Botanical  
 Department of Smith College gave an il-  
 lustrated lecture on "The scientific basis  
 underlying common garden operations." The  
 meeting was held in the Lilly Hall of  
 Science, Smith College.

The third annual Chrysanthemum Ex-  
 hibition will be held in the City Hall, No-  
 vember 4, 5, and 6. The local gardeners  
 and florists are doing their best to make  
 this exhibition one of the best ever held  
 in western Massachusetts. For schedule  
 of premiums address the secretary, Ed-  
 ward J. Canning, Botanic Gardens of  
 Smith College, Northampton, Mass.

### Syracuse, N. Y.

The Chrysanthemum Show of the Cen-  
 tral New York Horticultural Society will  
 be held in this city, at the Alhambra, No-  
 vember 9, 10, and 11; entries close three  
 days before exhibition. The secretary's  
 address is D. Campbell, Syracuse, N. Y.  
 The announcement that E. C. Stearns  
 Co., makers of the Yellow Fellow bicycle,  
 will present one of their high-grade  
 wheels for a new solid yellow seedling  
 Chrysanthemum, has been already men-  
 tioned in these columns. The competi-  
 tion is open to all, only plants in pots
